Public Health in the Middle East

Plans for developing a health control program in the Middle East are being developed through the coöperation of a number of agencies. Under a grant from the Commonwealth Fund, Henry E. Meleney, M.D., of the New York University-Bellevue Medical Center of New York City is surveying the teaching needs for the American and French Universities in Beirut, Lebanon. Full-scale public health teaching will be provided by American University under the leadership of Dr. Zaken Shakhashiri, now training at the Johns Hopkins School of Hygiene, and with the help of the Rockefeller Foundation.

The Lebanese Minister of Health, Dr. Elias Khoury is planning with Dr. Bruce Wilson, regional director of the Rockefeller Foundation, for the training of Lebanese students in public health in the United States under Rockefeller Foundation scholarships.

The recent Cairo regional meeting of WHO disclosed that the physical and intellectual capacity of the population was being seriously undermined by the startling prevalence of infectious diseases. Oil interests also have felt the need of help with their public health and preventive medicine programs among their workers. They are providing funds for raising salaries sufficiently to hold men of ability in the medical school of American University.

At the same time, the Chief of State of Syria, General Husni Zayem, hopes to improve health and medical instruction at the medical school in Damascus. The dean of the medical school is taking part in some of the Beirut planning for improved teaching.

Techniques of Counseling in Regard to Health Problems*

RUTH STRANG, PH.D., F.A.P.H.A.

Teachers College, Columbia University, New York, N. Y.

THE group consisted of very able persons engaged in many kinds of health education. They participated in recording, in discussion, and in spontaneous dramatization of interviews. It is difficult to summarize outcomes briefly as the chief value was in the sensitivity gained through consideration of concrete situations.

The "Discussion 66" technique was used to bring out everyone's questions and problems about health counseling.

The discussion of these questions and problems follows:

1. What is the aim of health counseling?

The end in view of health counseling is healthier persons. This end is achieved through changes in attitudes, a new orientation, a clearer idea of one's health potentialities and how to realize them. Counseling is a face-to-face relation in which growth takes place. It is an experience in which the child or adolescent obtains a clear idea of the best health possible for him and how to achieve it. Personal adjustment often results in desirable changes in the environment and affects group morale favorably. Better health also enables the child to profit more from all the experiences the school offers; it helps him to learn better. The effect of health counseling may even extend to the next generation through parents who understand themselves and have achieved the best health possible for them.

The role of the counselor is to facilitate the process of self-realization. Guided by a goal that is bigger than himself and beyond himself, the individual will use the resources within himself to attain his most acceptable self. This is a social self that contributes to the welfare of all.

2. How is counseling related to the total health education program?

Counseling is part of a larger whole, including group experience. In the classroom, and on the playground the teacher recognizes health problems, e.g., several accidents that have occurred, colds being spread unnecessarily. She brings these problems up for class discussion, solutions are suggested, and the best selected and carried out. Attitudes toward health are built through group discussion. Thus, counseling of individuals is done against a background of group experience; it uses various school and community resources.

Individual conferences may indicate a need for a more varied physical education program, ranging from a rest period to strenuous competitive games. More committees, small interest groups, more informal social experiences may be needed for the all-around development of some students. In subtle psychosomatic ways, success and satisfaction in social relations affect an individual's health. Educational and vocational de-

* Review of discussion at a Round Table before the School Health Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

cisions, attitude toward marriage and family life, feelings of inferiority and inadequacy, to some extent involve health factors.

3. What situations offer opportunities for health counseling?

The health examination and preschool clinic offer opportunity for counseling pupils and parents of young children; teachers recognize the need for counseling certain individuals in their groups. The first step in studying reading problems is to check on visual, auditory, speech, and other health conditions; home visits, interviews sought by parents and by children all offer opportunities for health counseling. The attendance officer or a social agency may bring health needs of pupils to the attention of the counselor. Parallel with the problem approach to health counseling, is the basic developmental counseling that helps every pupil to discover and develop his health potentialities. As counseling is always in a setting, it will vary with the type of school and community, personality and training of the staff, resources in the school and the community, and needs of the pupils and their families.

4. Who should do counseling?

Teachers, nurses, doctors, counselors, psychologists, psychiatrists each work on different levels of counseling. Teachers should always be brought into the picture; they have the advantage of the longest daily contact with pupils and the opportunity to observe them in groups; they can give them help at the psychological moment when they feel the need of it; they can offer "mental hygiene first aid." Nurses have more technical background for their counseling but leave diagnosis to the physician. Psychological counselors and psychiatrists work on a deeper level of psychotherapy. In situations in which there are no specialists, the teachers and principal establish a constructive, friendly relation with pupils and their parents and make a survey of local, state, and national resources on which they may draw for mental hygiene, health, social work, and psychiatric services.

5. What are the techniques of effective counseling?

The tendency on the part of many health workers is to give advice. This advice frequently does not "take." Counseling is not advice-giving. Instead of assuming the responsibility for solving parents' or pupils' health problems, the worker, through skillful counseling, should try to stimulate them to take initiative and responsibility. The short single contact often goes through three phases: (1) the counselee expresses freely his thoughts and feelings and tries to think through the situation, (2) the counselor tries hard to understand; he reflects the counselee's feelings, raises questions that help him to clarify the situation, and interprets, if he feels that the counselee is ready for interpretation; (3) the counselee makes plans to carry out after the interview. At this stage the counselor may give information or make several suggestions, if the counselee has reached an impasse in his own thinking.

The counselor provides an atmosphere in which the individual feels encouraged and free to think through his problems of development. In this process parents and pupils grow in responsibility for self direction, in facility in self analysis, and in the ability to use resources within themselves and their environment to attain better personal and community health.

6. How can the quality of counseling be improved?

As most administrators, teachers, nurses, and school physicians have had no preparation for their counseling re-

sponsibilities, they need help in improving their counseling techniques. Some of them will take courses in counseling; others will attend workshops; all can be helped through inservice education. The case conference is a slow but sure method of increasing school people's understanding of pupils. All the persons in contact with the case to be presented should be present. In a rural or small school this might be only the teachers and principal and perhaps the county public health nurse. In another situation, not only principal and teachers of the pupil, but also the school nurse, physician, school counselor, psychologist, representatives from social work and youth serving agencies that have had contact with the case might be present. The conference in which information about the pupil and his family is pooled and interpreted and recommendations made becomes a learning experience for all concerned.

Care Widens Its Services

It is no secret that, in spite of constantly improving conditions in the world, there are still many persons in many areas whose food intake is on the malnutrition, and often dangerously near the starvation, level. In view of this, Care has issued a new "They Still Need Care" packet that has literally everything needed to make sure no one will pass by on the other side—case histories, newspaper articles, *Fortune Magazine* article, among them. Care now has a great variety of food and supply packages, including one for babies, for literally everywhere from Okinawa to Greece and Cyprus. And on the theory that "man does not live by bread alone" it also has a book program.

Included is an attractive pamphlet with photographs and pictographs telling something of the three year history and activities of Care. It started in 1945 as a coöperative effort of 22 agencies some of which have since consolidated; now there are 26. The first package was delivered in France in May, 1946. As of October 31, 1948, more than 6,000,000 packages had been delivered (now well over 8,000,000). Plans are under way to extend operations to China, perhaps by the end of 1949.

This kit should be widely distributed. It is available from Care, 20 Broad St., New York 5.

Progress Report on Hospital Survey and Construction Act*

V. M. HOGE, M.D.

Medical Director, Division of Hospital Facilities, Public Health Service, Washington, D. C.

TWENTY-SEVEN months ago the President of the United States affixed his signature to a health bill that was unique in the history of this country. This was the Hospital Survey and Construction Act, Public Law 725, 79th Congress. This was a basically new and different type of health legislation which highlighted close coöperation between the federal government, state governments, non-profit organizations, and local communities. The act recognized hospitals as being a basic necessity in our public health structure, and outlined a plan for careful surveys of need to be followed by federal financial assistance in the construction of new hospitals and health centers. It is our purpose today to appraise, and likewise to praise, the accomplishments of the several states in this program to date.

THE PROBLEM

In viewing the accomplishments of the hospital program to date, it is well to look first at some of the problems with which the states were faced in the very beginning. I believe one of these might be called the psychological adjustment. In no previous program have the states been called upon to coöperate so closely with state and local hospital associations and with private non-profit associations in local communities. It was necessary to acquire new viewpoints and to establish rapport between the state governments and local community organizations.

The legal requirements of the federal act were rather formidable in most states. In some states, as many as three different types of new legislation were required. These were (1) legal authority to make the surveys; (2) legal authority to engage in the program as a whole, that is, to receive money and to pay it out and to employ staffs; and (3) legislation authorizing standards of maintenance and operation for hospitals receiving federal aid. (The act provided that this last legal requirement must be met by July 1 of 1948, but, as you know, the 80th Congress passed an amendment allowing a later deadline for this provision.) These legal requirements were fulfilled with remarkable dispatch, considering the magnitude of the problem. Advisory councils were set up in each state and wheels of administration began to turn.

One of the most important problems was the acquisition of new staffs of a type infrequently if ever before used in state health departments, such as, hospital administrators, architects, engineers, and so on through the long list of special skills required in the construction and operation of hospitals.

THE PROGRAM

The first big problem facing the states was the surveys of need. These

* Presented before a Joint Session of the Engineering and Medical Care Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 12, 1948.

were in most instances undertaken promptly and the preparation of the state plan followed the initial survey. The quality of the state plans coming out of this program I believe has surprised everybody, including the states themselves. Each definable community throughout the country, for the first time in history, has had its hospitals evaluated from the standpoint of their abilities to perform services required in that community. It is of interest, but not surprising, to note that of the 1,024,286 hospital beds evaluated, 144,909 were found not to meet these specifications and were declared nonacceptable. The system of priorities devised by the states has proved to be a remarkably potent factor in allowing the orderly administration of the program without political or other interference. The logical and factual nature of the priority system almost entirely precludes favoritism in the selection of projects. Since the projects to be aided are selected on a logical and factual basis, the prevailing philosophy among hospitals and communities is not "how can we get hold of some of this federal money," but rather "do we qualify for assistance?"

Also for the first time, state plans have presented an accurate picture of what the real hospital needs are in the country. They have produced the following picture:

We have 474,000 non-federal general hospital beds, of which 397,000 are considered by the states to be acceptable; we need 256,000 additional general beds. We have 85,000 tuberculosis beds, of which 72,000 are acceptable; we need 84,000 additional beds. We have 429,000 mental hospital beds, exclusive of those in domiciliary institutions caring for mental defectives and epileptics. Of these, 382,000 are acceptable and 311,000 more beds are needed. We have 36,000 beds for chronic disease; of these, 28,000 are acceptable, 248,000 more such beds are needed. We have 468 acceptable health centers; we need an additional 1,853 such centers.

THE PROGRESS

It is now 16 months since the first state plan was approved. It is a little over 4 months since the last plan was approved. Of the 53 states and territories, all but one now have approved plans and have had allotments made for the fiscal years 1948 and 1949. You will recall that it was correctly anticipated that the first fiscal year of the program would be required for surveys and the preparation of state plans. Consequently, no construction funds or contractual authorizations were requested or made available by Congress during the first fiscal year of the program. The first allotment was therefore made on July 1, 1947. Let us now look at what has been accomplished in the past 16 months.

Thus far, i.e., up to October 29, 1948, 540 construction projects have been initially approved; that is, they have met the eligibility requirements and have only to raise funds, acquire site, and prepare plan and application before final approval. Of these projects, 135 have received final approval and are now under contract. The estimated total cost of all projects so far approved is $302,000,000. Of this, the federal share is $93,000,000, and the state or local share, $209,000,000. The value of the projects now under contract is $62,000,000, involving $19,000,000 of federal funds and $43,000,000 state or local funds, or both.

You will be interested in some further details concerning the projects thus far approved. Of the 506 projects initially approved as of October 1, 1948, 387 are general hospitals with 18,878 beds; 16 are tuberculosis hospitals with 2,019 beds; 26 are mental hospitals with 2,879 beds; 9 are chronic disease hospitals

with 642 beds; and 63 are health centers. The total beds contemplated in this group are 24,418.

Although Public Law 725 stresses the need for hospitals in rural areas and gives such areas preferential treatment, there was the feeling in many sources at the beginning of the program that perhaps the metropolitan centers would obtain most of the federal funds. Let us see now if this is the case. Of the 387 projects in the general hospital category, 211 projects with 8,807 hospital beds and with an average of 42 beds per hospital are in "A" priority areas; 74 projects with 441 beds and averaging 60 beds in size are in "B" priority areas; 53 projects with 3,295 beds and averaging 62 beds in size are in "C" priority areas. Only 49 projects with 2,465 beds are in higher than "C" priority areas.

As a further check on the rural nature of the proposed hospitals, let us look at the population of the several communities involved. Of the 308 new general hospital projects approved, 256 are in communities of less than 10,000 persons, and of these, approximately half—126—are in small towns or villages of less than 2,500 population. Only 52 projects are in communities of more than 10,000.

We are building under the program predominantly small hospitals. Thus, of the 308 new general hospital projects, i.e., exclusive of projects for making additions or alterations to existing hospitals, 184 are for hospitals with less than 50 beds.

SOME ADMINISTRATIVE PROBLEMS

After seeing what has been accomplished, it might be well now to look at some of the administrative problems which we have observed throughout the country. One of the most evident is that of inadequate state staffs. In those states that have been able to provide a comprehensive staff with all of the technical skills required, the program is reflected in an exceptionally high quality of performance. In a great many states, due to lack of funds, administrative staffs are small and inadequate to obtain the best results. These shortages, however, are gradually being remedied and the quality of administration is gradually improving right across the board.

The second problem, and probably the greatest—all things considered—is the present high cost of construction. One of the results of this situation is the tendency toward inadequate estimates on the part of local communities. Inadequate estimates produce a number of undesirable effects. They may mean the total abandonment of a project, the consequent waste of all the time and effort that has gone into the preparation of the project, not to mention the tying up of state and federal funds. The second result is the rejection of bids and another lengthy and time-consuming period in which additional funds are raised. The third result is the drastic curtailment of the original project, often to the detriment of the functional value of the institution.

In the light of experience gained on contract costs, I believe the state agencies are now in position to prevent many of the short estimates that have been coming in during the early phases of the program.

Another problem we have noticed is the delay in getting out plans and specifications after all other requirements have been met. This we have found is largely due to the large amount of work which most architects now have on their drawing boards. Every effort should be made to speed up this phase of the work.

CONTRACT COSTS

We now have enough experience behind us to have some idea as to the current cost of hospitals and health centers.

You will recall that the general construction cost index has gone up over 100 per cent since 1939. Hospitals, of course, are no exception. It has long been the general custom to think of hospital costs in terms of beds. This basis of estimate, however, has little or no value unless one is comparing identical hospitals, of which there are none. The cost per square foot is the only reasonable basis of estimating and of comparing costs. On this basis, we have found costs to be averaging about $18 per square foot, which includes the built-in equipment but does not include the movable equipment, architects' fees, land acquisition costs, and so forth. When these items are added, then the square foot cost averages around $22. There is a good deal of uniformity in these square foot costs throughout the country, although one does encounter spots or areas in which contracts or contract bids are considerably in excess. These areas can be explained on the basis of local situations, usually because there is so much work that contractors are not interested in the more difficult hospital jobs.

THINGS TO WATCH

It may be well at this time to point out certain pitfalls which may lie in the path of this program. One in particular is the possibility of lapsed funds. As you know, the contractual authority granted by Congress is not exercised until the final approval in Part IV is signed. There is, therefore, the danger of lapsed funds in the first year's contractual authority. Each year's allotment is, as you know, effective for that and the following fiscal year. There are therefore but 8 months left in which to exercise the contractual authority granted in the fiscal year 1948. Eight months is a relatively short time in which to raise funds and prepare plans and specifications. It would be wise therefore to consider lower priority projects without further delay, if necessary, to obligate 1949 allotments.

Health of San Francisco Chinese

The San Francisco City-County Health Department has recently analyzed some vital statistics for its 20,000 Chinese, who make up the largest Chinese population in the United States. Among the facts revealed by the 1948 figures are:

The pulmonary tuberculosis death rate for Chinese is 85 per 100,000; for the entire city, 35.1. But in 1931 the Chinese rate was nearly three times as great, 236.6. The Chinese suicide rate is 80 per 100,000; for the entire population, 23.8. The infant mortality rate among Chinese, 22.1 is lower than the city-wide rate.

In 1948, 63 per cent of Chinese births were to mothers with less than two year's residence, as compared to 33 per cent in 1947 and 10 per cent in 1946.

The Hospital Survey and Construction Program*

Environmental Sanitation

MALCOLM C. HOPE

Sanitary Engineer Consultant, Office of Hospital Services, Division of Hospital Facilities, U. S. Public Health Service, Washington, D. C.

ENVIRONMENTAL sanitation problems in today's national hospital program are a direct challenge to the public health engineers in this country. Before discussing the question of environmental sanitation in the hospital and the possible approaches to the problem, let us consider for a moment the magnitude of the task. It may be somewhat surprising to some that the "hospital industry" is one of the ten largest in the nation from the point of view of personnel employed, services rendered, and purchasing power. It represents an investment of approximately 6 billion dollars with expenditures amounting to some $2,400,000,000 per year. The 6,173 hospitals provided hospital care for approximately 18,000,000 individuals (16 per cent of the population) during the past year and employed some 900,000 full-time employees. Surely, an industry of this size having a direct relationship to the immedate welfare of so many individuals not only deserves but demands every assistance in order to achieve its ultimate goal—improvement of patient care. It is one of the few activities in which it is possible for the engineer to be identified with the care and treatment of the ill and infirm. Practically every other program with which he is associated is in the field of preventive medicine. It has been pointed out that the national hospital program should prove to be an effective instrument in breaking through the barrier which exists between the fields of clinical and preventive medicine. It will provide a mechanism whereby the workers in the field of public health may clearly demonstrate the benefits of their work.

The philosophy of those concerned with the administration of the Hospital Survey and Construction Act, requires the full use of the knowledge and techniques of the public health engineer to achieve complete success in the program and its ultimate goal—improvement of patient care. Thus, added responsibilities are being thrust on the profession for the solution of the environmental sanitation and related problems in our individual hospitals. The Act provides that the individual states (at their discretion) must establish minimum standards for the maintenance and operation of hospitals which receive federal aid. At the moment, all states with one exception have passed licensure laws or their equivalent empowering the state agency to proceed with the development of minimum standards and the licensure of the hospitals. In most instances, these laws have been extended to include all hospitals and related institutions, such action being entirely logical

* Presented before a Joint Session of the Engineering and Medical Care Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 12, 1948.

and justifiable. In the development of the minimum standards, those relating to the physical plant constitute a most important part and are of primary concern to the engineer.

There are two fundamental questions which have to be answered before an intelligent approach may be made to the problem of environmental sanitation in hospitals. First, what are the specific problems to be met? Second, how can they best be handled? A review of the licensure regulations of the states shows that the basic minimum standards relating to sanitation have been covered. Many desirable features have been omitted simply because they could not, at the present time, be considered as minimum requirements. Nevertheless, the more progressive hospitals are interested not only in achieving compliance with the minimum standards but in surpassing them, and it is in this field that a real service may be offered to both the hospital and the patient. This involves the extension of the engineers' activities into areas with which he has not been too intimately concerned in the past but which are related to the environment of the hospital.

In the limited time available, let us look at certain of the sanitary problems from the viewpoint of the hospital needs and the benefits which result from attention given to the sanitation aspects involved. For example, sanitary considerations alone may dictate a choice between two sites. One specific instance is recalled where two sites were under consideration, both satisfactory, with the exception that only one was served by the municipal water and sewer system and the other was not. The latter site had special appeal to the hospital board in that it was to be donated to the hospital. An engineering study soon revealed that the cost of installation of a water supply and sewage treatment plant and the continuing operational costs would more than offset the saving in site cost. The hospital board wisely made the obvious selection.

In cases where sanitary facilities must be provided to serve an individual hospital, they should be designed and operated in accordance with the standards of the respective state health departments. As a rule, the systems have followed the general pattern quite closely. Nevertheless, there is a question as to whether the highly infectious character of hospital sewage may require additional treatment beyond that given to ordinary domestic sewage.

Preliminary studies of a sewage treatment plant serving a tuberculosis institution indicated that the tubercle organisms were capable of surviving the treatment process which consisted of primary sedimentation, biological treatment, and secondary settling. The studies indicated that final chlorination of the effluent, in the neighborhood of 20 p.p.m., was necessary to destroy the tubercle organisms. The proportionately high periodic concentration of laundry wastes in the hospital sewage may upset the biological balance in the treatment process. One instance was observed where a trickling filter had been rendered completely inoperative by the coating of the rock with insoluble soap curd deposited by the laundry wastes.

It is obviously ridiculous to protect the water supply from its original source to the building and then to subject it to various hazards of contamination from a poorly designed and installed plumbing system. Field studies have proved conclusively that it is not uncommon for negative heads and vacuums to occur in the building water distribution system as a result of breaks, shut downs and drainages for repairs, or inadequately sized pipes. Strangely enough, few plumbing codes have included provisions for the proper sizing of the distribution system which require consideration of the pressures available in the supply main, the

characteristics of the water from the standpoint of corrosion or caking of the piping materials, future installation of fixtures (a common occurrence in most hospitals), and the hydraulics of the system. Sole dependence cannot be placed on pressure alone to protect against backflow of waste material from plumbing fixtures or devices but it does minimize the hazard. In addition, adequate pressures are necessary for proper operation and the maintenance of the fixtures in a sanitary condition, and the reduction of noise caused by the flow of water in the system which is particularly objectionable from the viewpoint of the patient. A striking example in this respect was found in a hospital survey where no water could be drawn from a number of third floor fixtures when the washers in the laundry were being filled.

Since vacuums can and do occur, it is essential that the water inlets to the fixture terminate a safe distance above the highest possible water level in the fixture. In instances where this is not possible, backflow preventers must be used. These devices are mechanical and, therefore, subject to failure. Overhead drainage lines should be located so that leakage will not cause serious consequences. Such lines should never be exposed in food handling and storage areas. Sterilizers, dishwashing machines, refrigerators, food handling equipment, and similar devices should not be directly connected to the building drainage system because of the possibility of a stoppage in the drain resulting in the backing up of sewage or waste material. One other point peculiar to hospitals is the need for protection of certain types of equipment against possible contamination by the potable water supply. This necessitates the use of leak-escape proof valves on the various types of water-supplied sterilizers.

Unfortunately, too little attention is paid to the location and type of fixtures provided for the accomplishment of specific tasks in the hospitals. Inadequate handwashing facilities in patient and work areas may result in breaks of technique or unnecessary loss of time. These facilities should have the proper type fitting, wrist, elbow or knee action controls, to prevent the fixtures from becoming a vehicle for the transmission of pathogens. Proper location and numbers of fixtures will permit more effective use of the time of hospital personnel. Present accepted practice provides for the installation of lavatories in the patients' rooms and in a wall recess in the hall of each nursing unit. In this connection, consideration should be given in any hospital survey to the adequacy both in number and convenience of location of the toilet and rest room facilities for all personnel.

Food handling in hospitals is somewhat different from that in the conventional restaurant because of the transportation problem of the food from the kitchen to the patient which requires additional handling and resultant hazard of contamination. Because of the increased opportunities of contamination and the possible lower resistance of the patients to food infection, increased emphasis on proper food handling in hospitals is necessary. In using survey guides developed for other types of establishments, due consideration should be given to the special problems posed by hospital food service. Numerous instances exist where additions to the hospitals have overtaxed the food service facilities. In these cases, there is a real opportunity to devise procedures whereby the facilities may be used to better advantage pending the reconstruction or enlargement of the kitchen. The hospital should be informed as to the salient points to be observed in the design and construction of all food handling equipment prior to purchase. Considerable ingenuity will be required of the surveyor to adjust his recom-

mendations for improvements to fit the facilities available and the specific needs of the hospital. The problem of food handling and dishwashing in contagious or isolation areas must be given special attention.

Garbage and waste disposal may be handled in a number of different ways. The storage of these materials on the floor, facilities for transporting to point of disposal, and the method of disposal are all items which deserve attention. Improper facilities may result in nuisance conditions and provide breeding places for vermin. Special handling of infectious wastes such as those from surgery or isolation areas is necessary for the protection both of the hospital personnel and patients as well as those on the outside. It is a generally accepted fact, for example, that garbage from isolation areas should be kept separate from the other garbage and incinerated or boiled to destroy any pathogenic organisms present. In general, incineration of all garbage and rubbish is the most satisfactory method of refuse disposal. When this is not feasible, other methods such as the sanitary land-fill method might be used to good advantage. The advent of garbage grinders may simplify the problem of garbage disposal. With these devices, the garbage may be disposed of immediately, thereby eliminating the problem of storage and disposal.

No sanitary survey of an institution would be complete without consideration of insect, rodent, and vermin control. Proper screening and use of insecticides are necessary. Today, with the new insecticides available for use, instances of vermin infestation are inexcusable. Hospitals may either contract for services from a pest control operator or initiate their own program, in which case instruction of the personnel in the proper use of insecticides may be necessary. Our hospitals should be of rodent-proof construction. The elimination of rat harborages through proper construction of the facility combined with proper maintenance and operation will elminate the rodent problem. By extending this basic concept, would it not be possible to "vermin-proof" our hospitals through proper construction of the building and equipment?

The aforementioned problems have been recognized as problems of primary concern to the engineer. What of some of the other problems in the hospital which might interest the public health engineer? Housekeeping with its attendant problems of maintaining the hospital in a proper sanitary condition is one which should receive the attention it deserves. It would be reasonable to assume that the surveyor might make specific recommendations as to frequency and procedures to be followed in the cleaning of floors, walls, and ceilings. Improper methods will not only result in poorly cleaned floors and other surfaces but may result in damage to the covering. Cleaning procedures and materials should be adjusted to the surface being cleaned. For example, the cleaning of the various floor coverings, terrazo, asphalt tile, rubber tile, linoleum, cork, varies considerably.

The question of heat, light, and ventilation presents many problems which have not been satisfactorily answered in all respects. A critical study of the hazards of recirculation of air in the hospital from the viewpoint of transmission of infection should be made. While the use of ultra-violet irradiation and glycol vapors is still in the experimental stage and their general use has not been recommended, there may be special areas in the hospital where air disinfection may be indicated. The oiling of floors and oil treatment of linens and blankets might be desirable in the control of air-borne infections. This is particularly true in contagious areas such as tuberculosis wards. An added

advantage is that by the suppression of dust, housekeeping procedures may be simplified. One point to keep in mind, however, is possible fire hazard particularly in buildings of frame construction. Lighting relates directly to the comfort of the patient, prevention of accidents, and maintenance of proper sanitation in the hospital. Surveys should include a study of the adequacy of the illumination in the different areas with consideration given to the prevention of glare and the avoidance of excessive brightness ratios. Illumination and brightness meters can be used to good advantage in the survey. The use of color in the hospital on walls, ceilings, and equipment is directly related to the comfort of the patient. Certain basic principles have been established which should be familiar to the public health engineer.

There are two other fields of activity which are not normally considered to fall within the purview of the public health engineer. These are accident prevention and fire protection. Both are intimately related to the safety of the patient and hospital personnel. Accidents result in economic waste which the hospital can ill afford. Arrangements have just been completed between the American Hospital Association and the National Safety Council through which training materials and technical information will be made available to the individual participating hospital. The need for prevention of accidents in hospitals is so evident that little elaboration on the subject is necessary. Any survey of the physical plant would be incomplete without consideration of the question of fire protection. In many states, this is the specific responsibility of the fire marshal. However, the engineer should be in a position to assist in the enforcement and carrying out of fire protection measures, possibly as a representative of the agency having primary responsibility in this field.

It is recognized that this list of items of interest from the environmental sanitation aspects of hospital construction and operation is incomplete. Nevertheless, it may serve as a guide in rendering help and assistance to the hospital.

The objective of surveys of the type described is to secure necessary improvements. It is not possible to single out the physical facilities and environmental aspects and discuss them as separate entities. They are only some of the important facts relating to hospital operation and must be considered in the light of the overall needs of the hospital. In many cases, the reports on the results of the survey have included a multitude of recommendations for improvements which are beyond the ability or the financial resources of the hospital to carry out. The final result being that little is accomplished. The desirable approach involves having the survey team make a critical study of the hospital's needs and then establish a continuing program of improvement, with items relating to patient safety receiving first consideration. A report of this nature will be a useful tool to the hospital administrator and his board in planning and scheduling of work.

It would be well to stress the point that whenever possible all surveys by the state agency should be made in coöperation with the local health agency representatives. The local agency will be in a better position to render the follow-up services involved, such as schools for food handlers, inservice training program, collection of samples, and periodic check surveys. Where the administrator or other administrative official accompanies the survey team, they may be of mutual assistance to each other.

In conclusion, the challenge and opportunities of the public health engineer to render a service in the hospital field are real and pressing, and are most important in the total health program of the nation.

The Quality of Medical Care in a National Health Program*

A Statement by the Subcommittee on Medical Care

INTRODUCTION

IN October, 1944, the American Public Health Association officially adopted a general policy statement on "Medical Care in a National Health Program."[1] One of the three basic objectives recognized in the statement was: "Such a [medical care] program should insure that the services provided be of the highest standard and that they be rendered under conditions satisfactory both to the public and to the professions."

Throughout the entire statement, emphasis was placed upon the quality of the health services to be made available.

It is the purpose of this supplementary statement to present the essential components of medical care of high quality and the methods by which these standards can be approached in a national health program.

The quality of medical care depends upon more than intangible, philosophical attitudes or particular personality traits on the part of those who render services. More is involved also than the technical content of the individual practitioner's work—basic as this may be. A high standard of care includes very definite scientific and organizational elements which can be incorporated into planning and which eventually will submit to measurement.

Since standards of health service reflect the ever-changing social and scientific patterns of the times, there can be no permanency to any particular set of qualitative standards for medical care.[2] There is every reason to believe that scientific advances and progress in standards of living will take place in the future as in the past. A national health program must assure full freedom of experimentation and change in both the science and the organization of health service. It is recognized at the outset, therefore, that any concept of good medical care must be conspicuously dated.

SCOPE AND CONTENT OF AN ADEQUATE MEDICAL CARE PROGRAM

OBJECTIVES

The objectives of medical care in a national health program must include:

1. Promotion of positive health.†
2. Prevention of disease, disability, and attendant economic insecurity.
3. Cure or mitigation of disease.
4. Rehabilitation of the patient.

It is recognized that medical care is only part of a total health program.

* This statement has been prepared by the Subcommittee on Medical Care of the Committee on Administrative Practice as a contribution to current discussions of medical care in a national health program. The Subcommittee believes that particular emphasis needs to be placed on factors affecting the quality of medical service in order to insure sound planning. While the statement is focused on medical care in a national health program, the principles set forth are considered to be applicable to all types of organized medical care programs, including voluntary and public plans at the local, regional, state, or national level. Discussion and comments by interested readers are cordially invited.

† The Constitution of the World Health Organization defines positive health as ". . . a state of complete physical, mental, and social well-being, not merely the absence of disease or infirmity."

Thus, most measures for the promotion of health are broadly social or educational in character, relating to employment, housing, nutrition, economic and social security on the one hand, and to recreation and physical and health education on the other. Also, prevention of much illness, at least for water- and milk-borne and occupational diseases, can be accomplished without recourse to individual service by medical personnel. It is essential, however, that the medical care aspects of a national health program be planned with the total picture in mind. Such planning makes it possible to orient medical service not only toward treatment of disease but also toward promotion of health, prevention of illness, and rehabilitation of the patient in a social as well as a medical sense.

QUANTITATIVE ADEQUACY

"Adequate" medical care must meet both quantitative and qualitative standards. Quantitative adequacy involves both comprehensiveness and balance. This implies the provision of all services required to achieve the above named objectives, in proper amounts and with effective timing. Essentials for such quantitative adequacy include:

1. Participation of medical, dental, nursing, social service, technical, administrative, educational, and supporting personnel sufficient to provide the full range of modern scientific care.
2. Provision of care in home, office, clinic, health center, general hospital or specialized institution, according to the best interest of the patient.
3. Provision of drugs, appliances, laboratory services and other aids.
4. Application of all relevant services to illness, injury, defect, and maternity—and to preventive care for the apparently healthy.
5. Education of the public as to the wisest and most efficient utilization of all available health services.

It is recognized that services are frequently inadequate at the present time and cannot be uniformly provided for everybody, everywhere, when a national program is instituted. The policy must be accepted, however, of providing the maximum that is feasible through the use of existing resources, and of extending services as rapidly as medical and financial resources become available.

QUALITATIVE ADEQUACY

The components of qualitative adequacy may be considered as fivefold:

1. Able, well trained, and efficiently functioning personnel.
2. Facilities and equipment which meet high technical standards.
3. Health services which encompass the best knowledge of modern medical science, and which insure availability and continuity of care.
4. Adequate financial arrangements, making possible the timely provision of all indicated services, without economic deterrents for patients or practitioners.
5. Sound administrative organization and operation, designed to promote efficiency and economy of service.

Each of these factors is, of course, inseparably related to the rest. Effective health service requires competent personnel and facilities of high standard. Sound financing is a *sine qua non* of any successful program. Subsequent discussion will consider the organizational methods by which these five basic components may be related to each other, and to the achievement of the goal of high quality.

COMPONENTS OF GOOD QUALITY

PROFESSIONAL AND RELATED PERSONNEL

The quality of medical care is dependent on the competence of those rendering a highly personal service. Obviously, therefore, the standard of care in an organized program will reflect the individual abilities of the participating

professional personnel. Such professional competence, in turn, depends upon careful selection of trainees, adequate educational programs, and desirable patterns of practice. If, thereby, competent personnel with sufficiently diversified skills are available in adequate numbers and in equitable patterns of distribution, the first criterion of quality will be satisfied.

PHYSICIANS

Selection and Education

Pre-professional college education can be redesigned to prepare more broadly oriented students whose knowledge of the humanities and the social sciences will improve their later application of the natural and medical sciences.

Selection of medical students should be based increasingly upon objective appraisal of broad qualifications as suggested by the newer techniques of scientific testing,[3] and upon evaluation of applicants without bias on grounds of sex, race, religion, or nationality.[4] The impersonal—but nonetheless formidable—barrier of prohibitive student costs threatens to restrict the profession to members of upper income groups, unless increased financial aid is made available to students and to medical schools.[5]

Undergraduate medical education must be continually appraised in terms of the changing requirements of the times. The most pressing current need is for proper emphasis upon the interrelationships among the various academic departments,[6] and for production of physicians who are aware of the social as well as the scientific responsibilities of their profession.[7] Pediatrics, psychiatry, geriatrics, and preventive medicine all need strengthening in the curriculum. No medical student should be graduated without study of the psychological, social, economic, occupational, and other aspects of "total" patient care. No graduate should lack an introduction to the principles of medical care planning and organization. Such instruction is best facilitated when the school participates actively in organized community programs of health and medical care. A major role of the medical teaching center of the future will be found in its relationship to the regional health service network described below.[8]

Graduate education in medicine is currently characterized by an extreme unevenness of quality. Less than one-third of hospitals approved by the American Medical Association for intern and resident training are affiliated with medical schools. Wider affiliation of teaching centers with training programs of small hospitals could produce major contributions to the quality of medical service throughout the nation. Greater emphasis seems also needed upon the extra-hospital phases of medical education. The graduate should have experience in outpatient service, home care, social service, public health practice, rehabilitation, and rural and small community hospitals. This, too, may perhaps best be achieved within the framework of a coördinated hospital plan.*

Postgraduate education for practitioners of medicine is an important phase of quality of care. Programs for postgraduate education can be developed most effectively through: (1) special financial provision for postgraduate studies, and (2) coördination of teaching centers and outlying community hospitals in functional regional networks. Within such regional programs, consultants and instructors from the teaching centers can travel out for local meetings, clinics and ward rounds; practitioners in outlying areas can move to the regional centers for formal courses, train-

* Medical schools currently engaged in planning for such graduate education include Colorado, Medical College of Virginia, Michigan, New York University, Rochester, Tulane, and others. Descriptive literature can be obtained from the schools.

ing conferences and demonstrations.[9]*

The financial problems in medical education mark the limiting factor in the practical attainment of higher goals in both undergraduate and graduate education. Most university authorities and medical educators are now stressing the critical need for more adequate financial support of medical and related professional schools.[10]

Allocation of funds for education and training within the financial framework of the medical care program can do much to elevate standards of professional care. Special emphasis can be placed on the support of postgraduate education so that economic deterrents do not operate and teaching institutions are enabled to develop the needed resources. Funds might be particularly applied to training those classes of health workers now in short supply.

Such steps in themselves, however, could not solve the entire financial crisis in which medical education now finds itself. Carefully designed support to institutions and to students is needed on a national grant-in-aid basis.

Medical Licensure

The lack of uniformity in state licensure provisions and of sufficient reciprocity among the states has been a deterrent to the achievement of national standards or an improved distribution of physicians. In some states, rigid or unusual prerequisites for licensure prevent desirable flexibility and adaptability in medical education. Achievement by the states of greater interstate reciprocity and similar high standards of licensure, or common acceptance of the diploma of the National Board of Medical Examiners, would greatly ease this situation.

It has also been suggested that the qualifications of licensed practitioners be reviewed periodically in order to safeguard the quality of care provided. This proposal deserves further study and consideration.

Patterns of Medical Practice

The patterns of practice among physicians affect both the volume and the quality of the medical service rendered. It is a basic principle of planning for medical care of high quality that physicians and other personnel should be closely associated, operating together as a balanced medical team. The greatest single deterrent to good service is the isolation of the individual practitioner from his colleagues. The patterns of practice should, therefore, be such as to enable practitioners to utilize readily the skills of consultants and other specialized personnel, and to benefit from the stimulation of continuing professional contacts. They should have easy access to library and other educational resources, be free from the burden of non-professional chores, and have sufficient time and incentive to read, attend lectures, visit medical centers, and otherwise improve their knowledge and abilities.

Medical service of good quality is best promoted by the closest possible functional relationships between general and special physicians. The general practitioner can serve as the key person in the treatment of the individual patient, concerned with the total aspects of the case—medical and social—and freely referring the patient for specialty and consultant care when needed. Barriers to indicated referrals and financial irregularities in connection with such activity can be removed by sound administrative policy. This requires elimination of those financial factors which promote fee splitting and rebate practices on the one hand, and those, on the other, which deter the family practitioner from calling in a consultant because of additional cost to the patient or fear of "losing"

* Significant postgraduate programs have been developed in the regional plans of the Bingham Associates Fund based in the New England Medical Center (Boston) and of the Council of Rochester (N. Y.) Regional Hospitals.

the patient. Modification of the traditional fee-for-service method of compensating physicians is strongly indicated. Methods of remuneration should be such as to be equitable both to the general practitioner and the specialist, and to encourage proper referral. There should also be careful experimentation with full-time salaried consultants and with routine consultation procedures in selected circumstances.*

In clinics and hospitals, the goal of closer relationships between general and consulting physicians is approached by the creation of efficient referral procedures, definite appointment systems, interdepartmental conferences, and the like. With the receipt of complete consultation reports, the general practitioner can usually continue with the management of all but the most specialized therapeutic procedures.†

It is obviously impossible for rural areas and very small communities to support the full-time services of all necessary medical specialists. Improved general practitioner-specialist relationships are attainable through the regional organization of medical services. Under such a plan, physicians of smaller communities become functionally associated with specialists in larger centers. As a result, referral of patients is facilitated and there are more local requests for visiting consultants. In effect, the rural practitioner becomes a member of a regional "medical group."

Increased rates of payment for specialty service in an organized medical care program should, in the interest of quality, be limited to physicians who meet objectively established standards of special qualification. Overemphasis on American Specialty Board certification can be avoided if ample provision is made for acceptance of equivalents in training and experience, to be evaluated by competent professional councils. One approach to this problem is that of the Health Insurance Plan of Greater New York, in which specialists are designated on any of three bases: Board diplomas, teaching staff appointments, or individual qualifications.

The current practice of direct choice of specialists by the often confused patient represents an undesirable form of self-diagnosis and frequently involves much waste of time and money. Channeling of specialty referrals through a general physician or a specialist to whom the patient has been previously referred (including provisions for such referral in special cases by the medical administrator in the local area) would avoid many of the inefficiencies of unsupervised medical "shopping." Special procedures would, of course, be necessary for emergencies and for the somewhat different circumstances of pediatric, obstetric, and similar specialties where the patient can properly make a direct selection of the specialty.

Diagnostic aids—Modern scientific medicine requires that the able and well trained physician have access not only to consultants but also to the technical diagnostic and other laboratory procedures so essential to clinical accuracy. Despite the development of well equipped and well staffed laboratories in the better medical centers, many practitioners are not connected with hospitals; many have no ready access to private laboratories or are located in isolated rural and semi-rural areas. The office laboratory is no longer capable of supplying all the required aids to the modern physician.

A significant development would be the establishment of integrated diagnostic facilities throughout a state or regional area, available to all practitioners in the vicinity. Such diagnostic facilities might be best developed as part of

* Such as Caesarian section, amputation, etc.

† Efforts to enhance the prestige of the general practitioner have included establishment of General Practice Sections in hospitals and medical societies. A "specialty board" in general practice is also under discussion.

public health centers or community hospitals and clinics, and would serve their purpose most efficiently if correlated with the overall functions of public health agencies and regional hospital networks. This could effectively promote the development of proper diagnostic assistance for those rural practitioners whose small communities cannot support extensive laboratory facilities. Specimens, pathological tissues, x-ray plates and the like could then be sent to the coöperating district or regional centers, while periodic visits could be made to local communities by pathologists, radiologists, and associated technicians from the larger centers.

It is essential that a national health program include the services provided by diagnostic laboratories, and such facilities should be adequately reimbursed by the plan—unless established under separate public auspices.[11]

Group Practice—The efficiency and quality of medical service rendered by a coördinated group of qualified general physicians, specialists, and auxiliary personnel is being increasingly recognized. Group medical practice facilitates coördination of the personnel and facilities essential to medicine of high standard. It provides ready access to consultants and the technical services of trained auxiliary personnel, and permits full use of complex laboratory, x-ray, electrocardiographic and other diagnostic facilities.[12] The constant intra-group contacts in professional work are a primary stimulus to continuous education. Professional supervision of professional services can, moreover, be developed effectively in an organized group, while such quality controls are difficult to maintain in individual practice.[13]

Group practice is advantageous to the administration of a medical care program in a number of ways. More service can be rendered per unit of expenditure by groups than by individual practitioners, as a result of economies in organization of personnel and equipment. Overhead costs of operation are reduced. Administrative detail is simplified by the integrated structure of the service unit.

The effectiveness of the group practice method is further enhanced through the common use of a central well equipped facility—hospital or health center—as the base of operations for the group. Here all needed personnel and equipment can be concentrated for the most efficient service to the public. Wasted time and effort on the part of patients referred from one clinic or specialist to another can be avoided. Close relationships with public health and hospital services can be fostered. Wherever feasible, medical groups should be affiliated for teaching and research purposes with nearby medical schools.*

The very real limitations and possible abuses of group practice are not to be minimized.[14] Unless a broadly trained practitioner has overall responsibility for the patient, there is danger of overspecialization and excessive referrals within the group. Hurried and impersonal work should be avoided in group practice as well as in individual practice. Financial arrangements satisfactory to all group members are sometimes difficult to work out, as are methods of supervision and control. With sound organization, however, group practice can function to the decided advantage of both physician and patient.

A forward looking national health program should give every encouragement to the growth of group medical practice. Clear provision should be made for the participation of qualified groups in the provision of services. Such groups should receive payment at the same rates as non-group practitioners,

* For example, the New York University and Montefiore Hospital (Columbia University) units are affiliated with the group practice service of the Health Insurance Plan of Greater New York. The Hitchcock Clinic is similarly closely associated with the Dartmouth Medical School.

whether on a fee-for-service or capitation basis, the total amounts being determined by the range of services provided and the number of persons served. Any economies achieved by the group practice method should not be justification for a rate of payment to medical groups lower than that to non-group practitioners. Rather, such economies should result in improvements in the quality of service provided by the groups and in increased incomes for the physicians and other personnel associated with them. Medical groups should be free to decide their own internal methods of professional remuneration. Because of the intimate association of its members, a medical group is in an especially advantageous position to appraise competence among its physicians (and others) and to reward such competence in a fair and discriminating manner. With this desirable flexibility of remuneration, a group's internal arrangements can be made especially conducive to improvements in quality of care.

A national health program might well offer assistance in the form of grants to public and non-profit agencies and long-term loans for capital construction and equipment to such professional groups as give promise of increased efficiency, economy, and quality in the provision of services under the program.

DENTISTS

All of the principles enunciated above with respect to medical personnel are pertinent to the dental aspects of health service of high quality. Dental care should be included in the services provided in a national health program to the extent that available resources of dental personnel make possible. The current severe shortage of dentists and auxiliary dental personnel, however, necessitates a temporarily limited horizon for the provision of dental care to the public.[11] Current emphasis must be directed to preventive and protective dental care for children and to essential therapy for adults. Concurrently, a threefold attack on the overwhelming problem of dental disease in the nation can be made by: (1) training larger numbers of dentists and other dental personnel; (2) use of multiple chairs by dental practitioners and the performance of subsidiary dental functions by auxiliary personnel under professional supervision in order to increase the number of patients who can be served by a dentist and to achieve reductions in the unit cost of dental service[15]; and (3) increased research into the causes and methods of preventing and controlling the major dental disorders. Utilization of new types of auxiliary personnel capable of carrying out certain dental functions has been proposed many times in the past and is now receiving more favorable attention.[16]

Regionalism in health planning has the same application to dental as to medical practice, and the dental specialist should be an integral part of every comprehensive medical group, clinic, and hospital service.[17] Financial aid for education from public sources should include the professional dentist, the dental hygienist, and other auxiliary personnel—trained together for coördinated team functions.

NURSES

Services of professional and practical nurses form the third essential of the modern medical team. Nursing education programs should be planned in conjunction with known and predicted community needs for all phases of nursing service. The present great gap between needed nursing services and available nursing personnel emphasizes the importance of this consideration.

Education for professional nursing should be broadened to include more adequate academic preparation; experience in community, home, and small hospital nursing; and emphasis upon

the social and psychological aspects of patient care. Opportunity should be provided for the advanced training of needed supervisors, teachers, public health nurses, and specialists.

An excessive number of existing schools of nursing are low in student enrollment and affiliated with relatively small and isolated hospitals. Here the caliber of teaching is frequently poor and the demand for nursing service from the students is undesirably high. The quality of nursing care in general can be enhanced by greater concentration of professional nursing education in university-affiliated teaching hospitals with large enrollments.[17]

Opportunity should also be provided for adequate education of practical nurses. It is becoming increasingly recognized that planning for nursing education should take into account the need for nursing service at different levels in order to meet present and future demands for health services and care of the sick.[18]

While the present shortage of nursing personnel emphasizes the need for nurses' aides and orderlies to carry out routine mechanical duties, such allocation of duties is even more important from the viewpoint of increasing the efficiency and improving the quality of nursing service. Provision should also be made for the special nursing of single or grouped hospital patients whose clinical condition warrants such care. This would make it possible to curtail the wasteful use of private duty nurses; it would release many of these nurses for other types of service and would improve the quality of care by providing concentrated nursing care where it is medically indicated. In appropriate home care cases, nurses can be helped to provide more effective service through the use of trained and supervised housekeepers and "mothers' helpers."

State licensure for both professional and practical nurses is essential. The extent to which such licensure can be standardized, in ways similar to those recommended for physicians, will determine to a considerable degree the effectiveness of attempts to achieve a more rational distribution of nursing personnel among the states.

Standards for participation of both professional and practical nurses and of housekeeping aides should be established in a national health program. Home nursing and special duty nursing in the hospital should be paid for, but only when medically indicated. The inclusion of nurses and schools of nursing in the program of grants-in-aid for education and training is imperative if necessary improvements are to be achieved. Refresher and postgraduate education is as significant for nurses as for physicians and dentists.

MEDICAL SOCIAL WORKERS

The influence of social factors in the production of disease and in restoration of health is of great significance. No medical service plan can achieve high standards without the well integrated services of fully qualified medical and psychiatric social workers.[19] These workers play an essential role in determining the social factors which may affect the response of a given patient to illness and to medical care, and in assisting the patient to use the medical services of the community to achieve the optimum rehabilitation possible in terms of his physical and social capacities.

Social service should be utilized by clinics and practitioners as well as by hospitals and health agencies. The activities of the public health nurse and the medical social worker should be closely coördinated. The organized group practice of medicine affords the most practical opportunity for social work to permeate the day-to-day management of ambulatory and domiciliary medical cases.

MEDICAL ADMINISTRATORS

Good medical service depends constantly on the efficient, orderly, economical and resourceful management of the administrative phases of the program. Qualified professional personnel, however, are not necessarily experts in the field of medical, hospital, and public health administration.

The proper training of administrative personnel—both lay and professional—is as essential as sound preparation for any of the clinical specialties. Graduate courses in medical administration should be further developed, based upon a solid grounding in the health sciences and integrated with practical field training. The university schools of public health seem to be the proper places for the needed expansion of such training efforts.* A national health program should contain carefully formulated standards for administrative personnel, and should include such personnel in the program of grants-in-aid for education and training.

PHARMACISTS AND DRUG THERAPY

Modern advances in chemistry, pharmacology, and serology have produced an extensive armamentarium of therapeutic agents essential to medical care of high quality. To insure the successful use of these therapeutic agents in a national medical care plan, competent and scientifically trained pharmacists should be component parts of the medical service team, and should be active participants in the organized medical care program. With their coöperation, the evil of uncontrolled use of patent medicines and home remedies can be greatly reduced, and drug therapy more nearly limited to the utilization of ethical products listed in a professionally compiled formulary or included in one of the official pharmacopoeias. Good quality of care also requires rational and judicious use of all medicines. Multiple "shotgun" prescriptions should be avoided. The routine use in prescription writing of basic pharmaceutical compounds and non-proprietary names should be strongly encouraged.[20]

Administrative procedures which control the multiple abuses of drug therapy are essential to any medical plan of good quality. Payments from public funds should be limited to drugs provided upon prescription and should be confined to professionally approved items. Administrative and financial considerations require limitation of payment for drugs to preventive, long-term, and especially valuable and expensive medicinals.[11]

OTHER HEALTH PERSONNEL

Utilization of other professional health workers under competent medical supervision is essential to service of high quality. The full range of medical care today includes the services of the physical therapist, the clinical psychologist, and the occupational therapist, as well as the optometrist and the podiatrist. Each of these groups has a significant contribution to make in the treatment and rehabilitation of the patient. The importance of interprofessional teamwork and closer coördination of the activities of all types of health personnel cannot be overemphasized.

SECTARIAN PRACTITIONERS

Many factors have combined to encourage the appearance of large numbers of sectarian practitioners, quacks, and charlatans and their use in the provision of care to the American public. To the extent that these partially trained and untrained individuals render service to patients, the quality of the system of care degenerates. Factors which underlie the existence of such practitioners

* Organized courses in medical care administration are currently offered at the Schools of Public Health at California, Harvard, Johns Hopkins, Michigan, and North Carolina. Special training for hospital administrators is available at California, Chicago, Columbia, Minnesota, Northwestern, Toronto, Yale, and other university centers.

include: (1) shortages of medical practitioners, (2) maldistribution of professional personnel, (3) high cost of modern medical care, (4) inability of medical science to cope adequately with many problems of chronic disease, (5) failure of many practitioners to consider properly the emotional and social factors in medicine, (6) discriminatory practices which prevent minority population groups from receiving adequate medical services, (7) looseness of many state laws governing medical licensure, and (8) inadequacy of health education.

High standards of service in a national program require efforts to control the activities of sectarian practitioners by:

1. Elimination of all untrained practitioners, such as chiropractors, faith healers, naturopaths, and others, from participation in the payments for health services to individuals under the program.

2. Elevation of the educational standards of those groups now close to the concept of scientific medicine, as are certain groups of osteopaths, through financial and technical assistance to approved schools. This could make possible eventual incorporation of such personnel and their teaching institutions and hospitals into the regular ranks of medical personnel serving the public.

RESEARCH

A fundamental component of medical care of high quality is the constant and unfettered development of research studies in natural science, clinical medicine, social and economic aspects of disease, preventive methods, and administration.[21] The many unsolved problems in prevention and control of disease and in methods of medical care organization require the fullest possible research activity on the part of persons involved in the service program as well as those devoting full time to investigative work. A national plan for medical care should promote a better quality of services by providing opportunity within the program for professional and administrative personnel to utilize its operations and facilities for research purposes.

HOSPITALS AND RELATED FACILITIES

Able, well trained, and efficiently organized professional personnel can render services of high quality only when they and their patients have easy access to modern medical facilities which meet scientific standards and are efficiently coördinated for service. These should be developed through careful community and regional planning, and must be supported by greater public and private financing, with the goal of providing an adequate number of balanced and equitably distributed facilities.

HOSPITAL STANDARDS

Although existing professional associations have made real progress in elevating standards of hospital care, serious gaps still persist. Only two-fifths of all hospitals have the approval of the American College of Surgeons, and only one-sixth are approved by the American Medical Association for intern and resident training.[22] Proper standards and qualifications have been worked out in detail for very few of the special types of hospitals.[23] Uncontrolled and frequently inadequate proprietary institutions still exist in many communities—and indeed are increasing in some places for many of the same reasons that underlie the prevalence of quack practitioners and the use of patent medicines.

It is essential to the operation of a sound medical care program that careful standards for the approval of all types of health facilities be developed. The official health agencies of most states are now empowered to inspect and license general hospital facilities. The state agencies should supplement enforcement of licensure standards with positive efforts to aid the poorer hospitals in improving their facilities and meeting the conditions for approval.

Competent hospital consultant personnel are needed for this function. The private professional organizations should expand their activities in developing and promulgating general standards as well as special certifications necessary to the advanced educational and professional activities of the better hospitals. The role of the American Hospital Association in the formulation of the "model law" for state hospital licensure is an example of the responsible discharge of such professional obligations.

Where no licensure standards exist or where existing standards are not applicable or adequate, the administrative agency in a medical care program should formulate basic requirements for participation of hospitals.

REGIONAL COÖRDINATION

There has been extensive development of plans for the regional affiliation of rural, semi-urban, and metropolitan hospital facilities. The Public Health Service, the Commission on Hospital Care, various foundations and universities, and others have laid the conceptual groundwork for this regional approach to the many vexing problems of medical care, medical education, and hospital service.[24] This approach calls for the functional coördination of all health facilities in a region to form a network based on natural geographic lines and medical service areas. Outlying rural health centers and community clinics are related to small community hospitals in the more populous localities. These in turn affiliate with larger district hospitals, and all converge on the teaching institutions of metropolitan centers. Public health departments, nursing homes, special hospitals, and other facilities are integrated in the system at appropriate levels.

The network involves, as indicated previously, a two-way functional flow of medical services, professional trainees, consultants, diagnostic laboratory aids, and the like. In this way, the limited resources of rural and suburban facilities can be efficiently supplemented by the readily accessible services of district and base centers. Continual referrals, training, supervision, and technical assistance all serve to maintain a high level of professional quality throughout the region.[8, 17]

This principle of efficient regional coordination of medical and hospital services should be fundamental in the design of a national health program. Administration of the program should be decentralized to functionally sound regional areas and local health districts which take into account the natural flow of trade and medical service. Effective coordination of hospital regions and local public health districts could thus be implemented.

Once a national program managed to achieve the removal of financial deterrents to medical mobility within a region, any interested area would be better able to arrange the necessary service affiliations between metropolitan and local hospitals, between medical center specialists and small community practitioners, and the like. Funds allocated to peripheral communities would be available to pay for those laboratory, consultant, and other services obtainable only from the large centers of the region. Under a national plan, most or all residents of a region would be eligible for services at any level of the network, thus eliminating one of the most important impediments in current regional plans—the lack of adequate financial arrangements for purchasing the services available at all levels.

A national health program can assist teaching centers to assume their key rôle in the regional medical care system through educational grants-in-aid as discussed previously. Training stipends for professional and technical personnel would enable those in outlying areas to take full advantage of the educational

opportunities in the more highly developed hospital and related resources of the region. Grants-in-aid to health departments, universities, and other public and non-profit organizations should be made available for assistance in the planning and development of coördinated hospital and health center systems.

HOSPITAL STAFF

General elevation of medical standards requires the closest possible contact of all practitioners in the community with the hospital facilities that are available. Good care is impossible to provide in isolation from the consultants, laboratories, equipment, and other facilities of the modern hospital. It would seem desirable, therefore, to reverse the accustomed "closed staff" arrangements and allow all licensed practitioners to utilize the hospital, but they should be restricted to activities within their scope of competence and constantly supervised and aided in their work by the whole professional staff of the institution. This would contrast favorably with the present custom of forcing the least able, the least popular, or the late-arriving physicians into total isolation from the benefits of modern hospital centers. As more experience is gained with open staff organization, standards for hospital participation in the national program might reflect this principle.

Full-time Staff

A growing tendency is discernible toward the establishment of full-time hospital staff nuclei, whose salaried members constitute an effective group practice unit for patient service consultations, teaching, and research in the hospital. Many of the top ranking university hospitals of the nation have long maintained full-time medical staff personnel. This development serves to enhance the quality of hospital and outpatient care, and provides the affiliated part-time physicians with a source of valuable assistance. As Peters has pointed out,[25] more adequate public support of the beds utilized for care of the medically needy would enable hospitals to offer satisfactory salaries to qualified full-time physicians and thus greatly extend the scope of this movement. Affiliation of community hospitals with medical schools in regional programs would also stimulate this practice.

Even more effective would be the full-cost payment to hospitals for the care of the needy that would be made under a national medical care program. With cost reimbursements for all or nearly all patients, hospitals would be in a far better position to retain full-time staff, to support research and teaching, and to provide consultants and special services for affiliated outlying hospitals.

Specific provision should be made in the plan of payment to participating hospitals for the inclusion of salary funds for full-time staff members. This, together with the guarantee of hospital reimbursement for all or nearly all patients, would provide the financial basis for vastly improved hospital care.

Staff Organization

Continuous maintenance and elevation of standards within the hospital depend upon conscientious organization of the clinical staff and upon its educational and self-appraisal activities.[26] Recognized functions of good hospital staffs include regularly scheduled conferences, analysis of previous hospital experience, and review of problem cases and of unexplained deaths.[27] Chiefs of service can judge the general quality of their departments through such objective criteria as the number and type of consultations, frequency rates for certain categories of surgical and other therapeutic procedures, autopsy ratios, record keeping, incidence of preventable complications, utilization of laboratory services, and the nature and number of referrals to social service.

A useful device for the encouragement of high levels of staff performance is the so-called *medical or statistical audit* which has been used for many years by a few leading hospitals and is now coming into more general favor.[28] This is a periodic audit by the entire medical staff of the work performed in the hospital. The necessary requisite is comprehensive and uniform record-keeping on the part of the medical staff. On the basis of these records, statistical tabulations and analyses are compiled which show the morbidity and mortality experience of each service and each individual staff member during the period involved. Initial diagnoses and prognoses are compared with the results of hospital treatment. Such analyses, carefully made and interpreted, become the basis for self-education and improvement, for staff appointments and promotions, for evaluation of new procedures, and for the discovery of sources of poor work in the institution.

The quality of hospital care correlates directly also with the caliber and activity of the personnel conducting pathological and radiological services in the unit. Persons responsible for these technical specialties must be fearless and honest in their diagnostic work, if first-rate medicine is to be practised, and if unnecessary and unwarranted therapeutic procedures are to be minimized.

All such elements of quality in hospital service should be reflected in the standards and procedures set up under a national program for medical care.

GENERAL AND SPECIAL HOSPITAL RELATIONSHIPS

Technological advances in medical science and the unplanned development of community health facilities have resulted in an uncoördinated maze of chronic, mental, tuberculosis, communicable disease, maternity, and other special hospital facilities. Highest standards of medical care, however, call for the physical unification of special hospital facilities within the framework of the general hospital plant. If planned construction of this nature is not immediately feasible, the closest possible administrative and functional relationships should exist between the "parent" general hospital and subsidiary special institutions.[29] Within regional areas of service in a national program, special long-term facilities can be affiliated with general hospitals at appropriate levels.

Such coördination of general and special hospital facilities is essential if continuity of patient care is to be achieved in a medical care program. Proper medical supervision of nursing, convalescent, chronic, and other institutions by the active staffs of affiliated general hospitals is possible only in this way. The most economical use of all the physical and human resources of the various units of the hospital system is thus realized. Finally, financial and other deterrents to the easy transfer of patients from one institution to another can be overcome only when all facilities in an area are functionally coördinated and jointly participate in a single financial plan.

TRANSPORTATION SERVICES

A necessary component of a coördinated and comprehensive system of home, office, and hospital care is the provision of good ambulance service. The smooth functioning of the regional hospital plan also depends to a considerable degree upon the efficiency of the system for transporting patients, personnel, and diagnostic specimens.

The modern concept of ambulance service might well include provision of air transportation for patients living in remote areas, for those isolated by impassable road conditions, and for those requiring immediate care in a specialized facility. Such service should be arranged in relation to the regional hospital plan so that patients can be treated in the nearest facility competent to provide

the care required. The advantages of air transportation for rural and mountainous areas have never been fully investigated, apart from the extensive war experiences and the experiments in Australia, Saskatchewan, and a few other countries. The combination of outpost health centers containing the medical essentials, plus quickly available air transportation to fully equipped hospitals and medical centers, may serve to alter some current concepts regarding the best means for providing medical care to outlying areas.

It would seem essential to the goal of high quality that such services be included as rapidly as feasible in a national plan, following full experimentation in selected areas.

RELATIONSHIPS OF HOSPITALS AND HEALTH DEPARTMENTS

A recent statement of the American Hospital Association and the American Public Health Association has emphasized the advantages of joint housing and coöperative functioning of hospitals and health departments.[30] By such joint activity, the services of each can be strengthened, continuity of care can be facilitated, and the necessary rapprochement between preventive and curative medicine can be encouraged. With the increasing assumption of administrative responsibility by health departments for state and local operation of medical services—as urged in the 1944 A.P.H.A. Statement[1]—official health authorities are becoming more closely associated with hospital problems. A real impetus toward coördinated activities and joint housing can be foreseen in this connection.

The logical development of all aspects of hospital and related care leads to a broad concept of the community health and medical center, from which can emanate the fully coördinated and balanced health services needed by a local population. This involves not only the joint housing of hospitals and health departments, but acceleration of the discernible movement toward establishment of offices for private physicians and medical groups within the hospital proper. Thus, the role of the community hospital is strengthened as the total medical services of the area are organized around it.[31]

The community health and medical center can help realize many of the goals previously discussed: coördination of home, clinic, and hospital care; organized professional staffs with hospital offices; unification of inpatient and outpatient services; provision of diagnostic services for private practitioners; coöperative emphasis on preventive medicine and health education; and, finally, regional affiliations with outlying health stations and with metropolitan medical teaching centers. Through development of such community health centers, within the framework of an organized medical service program, the highest standards of patient care can be achieved.

SERVICES

A major criterion of medical adequacy is that the services rendered be comprehensive, balanced, and afford the patient a maximum continuity of care. In the previous discussion of personnel and facilities much has also been said of the content and organization of services. This section will further consider some of the special aspects of medical service which have a particular bearing on standards.

PREVENTIVE CARE

A most significant criterion of medical care of high quality is the degree of emphasis placed upon prevention of disease. The unfortunate separation of preventive and curative medicine—historically developed in the independent activities of public health officers and private practitioners—is incompatible

with the highest standards of modern medicine. "Prevention" no longer deals only with preventing the initial onset or occurrence of disease. It also means preventing the continuance or progress of disease which has already occurred; it means preventing the development or persistence of disability or invalidism, and of dependency, destitution, and other undesirable social effects. In other words, effective preventive service requires prompt, comprehensive, and continued personal care as well as community service of the kind traditionally associated with public health activity.

Public Health Services

A national health program should include provisions for the development of full public health coverage in every area and for the integration of medical services with the activities of public health agencies. Community organization of disease control measures applicable to large groups of people can reduce considerably the incidence of illness. Public health measures, if properly supported, can eliminate many of the preventable diseases now adding to the costs of medical care and public assistance. Provision of optimum community health protection allows the greatest possible application of medical care funds for diagnostic and therapeutic services in conditions not controllable by present-day mass methods.[32]

Preventive Medical Care for the Individual

Effective preventive service requires not only close coördination of the medical care program with that of public health agencies, but also strong program emphasis on individual health promotion and preventive care by practitioners. The effectiveness of the preventive work accomplished reflects in large degree the extent to which financial barriers between the patient and the practitioner have been removed. Good preventive care requires the elimination of special charges for initial or any other visits to the physician or clinic. It implies the geographic availability of services, as provided through coördinated regional networks and special incentives for rural practice. It makes essential the placing of administrative emphasis upon effective home and office care, diagnostic services for ambulatory patients, and simplification of administrative procedures in the provision and receipt of personal care.

The medical services of the program should also facilitate appropriate periodic health inventories of selected classes of individuals.[33] Provision should be made —in conjunction with public health agencies—for mass screening programs utilizing such newer techniques as the 70 millimeter chest x-ray and the microchemical diabetes test. Such health inventories are made feasible only by the removal of the financial barriers confronting the supposedly healthy individual and by the assurance of medical care for disorders which come to light. An essential component of these appraisals should be health guidance for the entire family.

SOCIAL AND ECONOMIC ASPECTS OF MEDICAL CARE

Medical service of the highest technical quality is frequently ineffective if rendered without regard to the social, psychological, and economic factors affecting the patient's condition. Good clinical care involves treatment of the patient as a "whole person," as an individual functioning in a definite social environment, rather than as an impersonalized example of an organic pathological disorder.[34] In the modern technical maze of diagnostic equipment, laboratory tests, special consultations, complex hospital routines, and the like, the tendency to lose sight of the individual patient is great. Comprehensive study of the patient is therefore neces-

sary, involving all aspects—whether related to home, occupation, income, diet, or other factors—which are relevant to the patient's illness and his restoration to health. Diagnosis and therapy should be planned in careful relation to the realities of the patient's socio-economic situation. Clinical services should be closely correlated with other programs of social welfare, including vocational rehabilitation, housing, recreation, and other services. Professional standards in a national health program should continually be concerned with the social factors influencing the patient's recovery and with the effective utilization of all resources, within medical agencies and in the community, for meeting his needs

The recent tendency to deal with the family as the unit of health care is an effective approach to the consideration of social and environmental aspects in medicine.[35] It represents one effort to recapture the valuable relationship that existed between the old-type family practitioner and his patients. Medical service teams operating in community health centers can deal effectively with the health problems of whole family groups and can promote hygienic habits through family health guidance activities. Significant developments of family health centers are under way in many countries, particularly England, South Africa, Canada, Sweden, and the Soviet Union.[36]

A national medical care program can promote the principle of family care in community health centers in at least three ways. Under the plan, the entire family group would be eligible for similar services. Guaranteed payments to practitioners and hospitals make possible the maintenance of health centers in any community—particularly if high priority is given for capital construction grants to these facilities. Finally, the regional pattern of organization can assure needed specialty services for small health units through their functional ties to nearby better equipped hospitals.

PSYCHIATRIC SERVICES

It is becoming increasingly recognized that the isolation of psychiatric from general medical services is mutually detrimental and hinders the development of services of high quality. The current interest in psychosomatic medicine indicates that the health professions are receptive to the possibility of bridging this gap. A national health program, properly oriented toward mental health, can provide the necessary leadership and material basis for achieving this purpose. It can stimulate the development of mental hygiene clinics and psychiatric units as regular rather than exceptional services of the general hospital. Through encouraging the inclusion of psychiatry in medical groups, clinics, hospitals, and regional plans, a national health program can promote the integration of skilled psychiatric personnel into all general health and medical services. It can help to educate physicians and other health workers to understand the importance of psychological factors in the management of their patients. Most important of all, it can bring about an extensive development of preventive psychiatry, utilizing services such as well baby clinics, school health programs, and all other community resources for the widest possible dissemination and application of sound principles of mental hygiene.

CONTINUITY OF MEDICAL CARE

High standards for medical service require more than adequate personnel and facilities. The patient must be guaranteed the advantages of continuous and interrelated care. Such care involves attendance by the same physician, dentist, nursing team, social worker, and so forth, throughout the course of the patient's management—as far as is practicable and desirable. It will be modified, of course, by the need for

consultants, referrals to differently qualified personnel, and freedom of choice and change on the part of physician or patient. Nevertheless, the principle of continuity of care should enable the patient to remain under coördinated management throughout all phases of treatment.

Continuous care must not only be well integrated but also complete in its various aspects. High quality of service is difficult to achieve unless domiciliary, ambulatory, and institutional care are all systematically developed. The full range of health service—from prevention through rehabilitation—must be integrated from the patient's point of view. Professional personnel must be free to render service wherever indicated by the clinical and social factors in the case. The highest standards are not achieved when the services of an organized program are limited to one particular type of care—for example, inpatient hospital services. Full continuity of care permits a medical plan to exploit the advantages of home care for children, the chronically ill, mild cases, and others who might benefit in selected instances.[37] It makes possible saving of hospital beds, reduction in length of hospital stay, easy transfer of hospital patients to convalescent facilities, and other service and administrative advantages. For rural and suburban areas this concept of continuity and completeness of care can best be realized through the regional network of medical facilities and functions described above.

CARE FOR CHRONIC ILLNESS

The principle of continuity includes the concept of service for long-term illness and disability. Good medical care does not stop at the provision of services necessary to control the acute episodes of disease. Scientific care of the patient includes chronic hospital, convalescent, rehabilitative, and nursing-home services wherever necessary.[38] Adequate programs of home care are vital in the proper management of many chronically ill individuals.

A recent joint statement of the American Hospital Association, the American Medical Association, the American Public Health Association, and the American Public Welfare Association, has outlined recommendations for optimal service for the chronically ill.[29] The statement recognizes that the care of long-term illness presents certain special aspects, but emphasizes that it cannot be isolated from general medical services without incurring serious danger of deterioration in the quality of care.

REHABILITATION

The vast experience of those responsible for rehabilitation of the wounded during the recent World War has renewed professional interest in this long neglected phase of medical care.[39] It is now widely recognized that treatment is not completed when the clinical disorder is eliminated or stabilized. Wherever possible the patient must be restored to a useful and self-sufficient place in society. This involves the coördination of medical, psychiatric, physiotherapeutic, educational, vocational, and social services. As in the case of services for the chronically ill, rehabilitation programs should provide for maximum continuity with earlier phases of care, and should be developed in close association and coördination with general medical services and facilities.

DISCRIMINATORY PRACTICES IN HEALTH SERVICES

The persistence of discriminatory practices in profesional fields continues to depress the quality of medical care.[40] Minority population groups are too frequently denied needed medical services because their members are refused equal opportunity for professional education and advanced training. Physicians and other professionals from these minority

groups are turned away from the very resources that would maintain the quality of their work: hospital appointments, medical society membership, referral arrangements, teaching affiliations, research opportunities, and the like. Patients, on the other hand, often find themselves barred from certain practitioners' offices, from entire hospitals, and from needed private accommodations—or else they are afforded cursory or substandard treatment that fails to satisfy their needs. Segregated facilities generally are below the standard maintained by other institutions in the community. The entire picture of discrimination in health service is inconsistent with the high precepts of medicine and serves to perpetuate some of the most glaring examples of low quality of medical care in the nation. A national health program should eliminate all barriers to needed service—social as well as economic and geographic.

ROLE OF THE PUBLIC

In developing a medical care program of good quality, the public has a vital role to play—both as responsible members of the community and as patients on the receiving end of the services. A high caliber medical service can be effective only if properly utilized. The recipients must be taught, through carefully designed programs of health education, when to seek medical care, how to use the various resources of the program, and how best to follow the recommendations and directions received from professional attendants. Appropriate educational activities in the program will stimulate public desire for high quality of service and will indicate the disadvantages of unnecessary demands for care. An intelligent, coöperative and sensitized population is quick to detect flaws in standards of service and can make real contributions to the program by timely and judicious comments on quality of care received.

As supporters of, and participants in, a national medical care program, the public has many opportunities for enhancement of service standards. Full lay representation on policy and planning boards and on advisory committees helps to insure equitable consideration of the patient's point of view. Active understanding of operations and procedures affords recipients a greater sense of personal identification with the plan, and is conducive to better public response. In this connection, trained health educators have a vital role to play in facilitating effective operation of the program.

FINANCING

An essential factor in medical care of good quality is that of sound and adequate financing—so designed that no economic barriers restrict the provision of needed medical services, and that fair and adequate remuneration is provided to all those furnishing the care. Good medical care, although purchaseable, is not cheap. As Sir Arthur Newsholme has stated, it should be considered worthy of generous support.[41] The financial savings to society produced by preventive care, early diagnosis, prompt treatment, and effective rehabilitation are actually far in excess of the original cost of such service—in terms of increased productivity and reduced public outlays for care of persons with chronic illness, disability, insanity, dependency, and destitution resulting from disease.

A fundamental principle of quality in medical care, then, is adequate financial support for service and administration. Meager financing can effectively limit the scope of service offered or demanded; can restrict the number and competence of participating personnel and facilities; and can postpone indefinitely the proper organization of available resources. As a first step in the achievement of high medical standards, the economic barriers between the best

of medical resources and their application to the requirements of optimum public health must be removed.

ECONOMIC BARRIERS TO MEDICAL SERVICE

The removal of financial deterrents in the provision of medical care has immediate and lasting effects upon the quality of that care. These include:

1. Encouragement of preventive services, since recourse to medical attention during health and early illness is no longer financially penalized.
2. More adequate use of laboratory, consultant, and institutional services, thus promoting full use of all modern scientific weapons in the war against disease.
3. Improvement of doctor-patient relationships, by the elimination of extraneous financial considerations from the consultation room.
4. Assurance of adequate income to professional personnel and of economic protection against the cost of illness to patients, thereby promoting better provision and reception of medical service.
5. Continuous support of medical education and research within the financial arrangements of the program.

FINANCIAL STABILITY

The 1944 A.P.H.A. Statement[1] recommends that "A national plan should aim to provide comprehensive services for all the people in all areas of the country . . . Services should be adequately and securely financed through social insurance supplemented by general taxation, or by general taxation alone. Financing through social insurance alone would result in the exclusion of certain economic groups and might possibly exclude certain occupational segments of the population." If such a program, providing service for the entire population, cannot be accomplished at the outset, the plan should at least aim toward the goal of universal coverage, and this goal should be achieved as rapidly as possible.

Adequate and stable financing is the necessary foundation for a medical care plan of sound structure. If social insurance is utilized, the maximum financial stability and adequacy is obtained by substantial supplementation with general tax funds and by coverage which assures the broadest possible spread of risk and the widest possible sharing of costs. Differential selection of the best risks by private insurance agencies (so-called "contracting out") should not be permitted because it would leave the national plan in an adverse financial position, greatly complicate administration and public participation, and expose the program to commercial exploitation.

Financial stability need not depend upon procedures such as "bárrier" or extra payments, curtailment in duration of service and the like, which restrict unduly the scope of medically necessary service. A nation-wide program, with resources organized for maximum efficiency of service and with payment methods which permit economy of operation, can achieve a highly stable financial basis. However, some limitations on drug, dental, hospital or related services will be necessary at least initially, until the medical and administrative resources of the nation are more adequately developed and more efficiently organized.

Whether the medical care program is financed through social insurance supplemented by general taxation, or by general taxation alone, it is recognized that additional support from general tax funds is necessary for construction of needed facilities, for professional education, for research and other grants-in-aid, and for similar functions. Such provisions of a national health program are essential to the achievement of a high quality of care.

ADMINISTRATIVE PRINCIPLES

The final criterion of medical care of high quality relates to the efficiency of administration in organized programs. The foregoing sections have outlined those elements of medical service which

constitute "good" health care. Such a structure neither develops spontaneously nor functions independently of expert supervision and direction. The efficiency of administration of medical care plans determines to a considerable degree the actual quality of the service received by the patients.

The purposes of effective medical care administration are: (1) to assure early, prompt and thorough service; (2) to maintain high standards; and (3) to guarantee continuity and consistency of care.[42] An administrative system that consciously strives to achieve these goals can take advantage of the now considerable experience that has been accumulated in this and other countries. A few of the administrative principles most directly related to quality of service might be briefly discussed. Many have already been implied.

POLICY AND PLANNING

Standards of service satisfactory to both the public and the professions can be achieved only when equitable representation of both groups is provided on all policy-making and advisory bodies. As a basic principle, the representatives of no one professional or economic group should have majority control of policy determination. Equitable voice should be given to consumers as well as providers of service, to farm and labor representatives as well as civic and industrial leaders, to dentists, nurses, social workers, and related personnel as well as physicians and hospital administrators. Whenever professional or technical matters are involved, decisions should be made by appropriate professional and technical bodies. The basic control of the program, however, must never be relinquished by the people themselves, acting through elected legislative representatives and the appointed administrative staff.

Those in charge of administration should be experts in this field, specially trained, adequately compensated, and chosen on the basis of a merit system. Competence in purely clinical or academic functions does not necessarily qualify a professional person for administrative responsibility. Quality of medical service and efficiency of operation can also be improved by the regular utilization of expert consultants in the various technical phases of the program.

Maintenance of high standards requires constant self-evaluation in the light of the rapidly advancing frontiers of medical and organizational knowledge. A national health program must engage in continuous appraisal of its own operations, and must promote all opportunities for controlled experimentation in both the science and the method of medical care. There exists currently a serious need for objective criteria by which the quality of service in an operating medical care program can be appraised.[43]

ADMINISTRATIVE SAFEGUARDS OF QUALITY

All administration should be in the hands of a single responsible agency at each level of government. At the outset a clear definition of function is essential for each of the administrative units, for all staff personnel, and for participating professional persons and institutions. The program should be decentralized for flexibility and feasibility of local application in providing and paying for services.

Eligibility requirements in a program of universal coverage would be limited to the single factor of medical need. If coverage is less than universal, the extent to which the program approaches the goal of complete national coverage will largely determine the degree to which restrictions on age, sex, residence or settlement, income, occupation and the like can be minimized.

In order to promote medical services of high quality, the use of the means

test as a criterion of eligibility should be eliminated in a national health program.[44] The personal indignity of financial investigations prevents many individuals in serious need of medical service from seeking care under means test programs. A basic requisite for good medical service is a healthy relationship between providers and consumers; recipients of charity medicine are not in a position to insist on a high quality of care.

Good medical care is not promoted when services are rendered on the basis of a double standard—one for "paying patients" and one for "charity cases." Recipients of public assistance should be included in the national medical care program, and the welfare status of such persons should be unknown to those providing the care.

The publication and periodic revision of *administrative procedure manuals* would help all participating personnel to understand and attain the desired standards of performance. These manuals should contain the administrative policies and procedures of the program and such professional routines as are promulgated by professional authorities and advisers connected with the plan.[45] If efficiency rather than inflexibility of service is to be attained, such manuals should be liberally interpreted and frequently reviewed.

Free choice and change of practitioner, medical group, or facility should be maintained, subject to geographical limitations and provisions for proper selection of specialists. Professional personnel should retain the right to accept or reject patients, with the provision that the professional participants in an area are collectively responsible for rendering needed services to all persons who do not elect or who are not accepted by a specific physician.

Various administrative devices are valuable in controlling abuses and promoting quality of care. The right of *administrative review* should be retained by central and local administrative jurisdictions; by this means, systematic checks on service records and billings can be maintained. This is especially necessary under the fee-for-service method of payment.[46] Professional review of case records selected at random has produced dividends in terms of high quality as, for example, in the various programs of care for crippled children.* The proper discharge of administrative responsibilities includes the right of the operating agency to ascertain the caliber of the services for which it is paying.

Automatic *statistical audits* of services and costs provide an accurate and impersonal check on the standards of service. Comprehensive systems for the tabulation and analysis of all operational data make possible the detection of those consumers and providers of service who deviate significantly from the average experience of the area in any given time period.[47] (Such deviations do not, of course, necessarily represent "abuses" detrimental to the program.) The various details of program operation can be studied and adjusted according to analyses of accumulated experience. Relative efficiency of different service districts can be compared. Experience with different methods of care, with different categories of illness, with different groups of beneficiaries can be appraised and applied to the development of better methods and procedures. Most abuses of the plan—either excessive demands for service on the part of patients or improper activities on the part of professional persons—can be identified and evaluated through the systematic application of statistical methods in administration. This technic does not penalize or inconvenience the great majority of participants because

* See procedures of the Crippled Children's Program, U. S. Children's Bureau, Federal Security Agency, Washington, D. C.

of abuses by a few individuals, as do such methods as review of service bills and proration of payments.

The requirement of prior *administrative authorization* for selected services of an unusually expensive or doubtfully efficacious nature is another useful control method. In this way the local area medical administrator, with the help of advisory bodies when warranted, may exercise some control over the economy and efficiency of the new system. Such required authorizations should be reduced to a necessary minimum and should never be allowed to interfere with the timely provision of needed medical care. High quality of care is promoted by the early and easy access of patients to medical attention—a consideration which outweighs in overall importance the relative infrequency of unnecessary demands for service. For this reason extra "barrier" charges for first visits, home visits, health examinations, and so forth, are seldom justified in the name of administrative control.

The *method of paying* participating professional and other personnel should be one which will encourage preventive medicine and a high quality of service. The fee-for-service method puts emphasis upon sickness rather than health and upon quantity rather than quality. It hinders appropriate referral of patients because it provides an economic incentive for the physician to retain his patient. This factor, in addition, seriously limits the effectiveness of regional hospital plans by impeding the referral of patients to district and regional centers for necessary consultant services. In an organized plan, fee-for-service is cumbersome, requiring itemized billing and auditing and thus a great deal of paper work. It is also the most difficult method under which to control use of service either quantitatively or qualitatively and is, therefore, the most expensive method to administer in a medical care program. Widespread use of unlimited fee-for-service might well make physicians' services so costly as to force economies in other essential health services such as hospital, nursing, or dental care. If, on the other hand, a ceiling is set on the pool of funds from which fee-for-service payments are drawn, excessive multiplication of services by a few physicians may serve to force *pro rata* reductions in all fees paid, thus penalizing the more conscientious doctors. Such a result has been seen in this country in the experiences of voluntary prepayment plans with attempts to provide payment for comprehensive physicians' services by fee-for-service. In Great Britain, under their former National Health Insurance program, physicians in some localities at first elected to be paid by fee-for-service, with the pool of funds limited to the same amount as was available under capitation. Some doctors provided excessive numbers of services; all fees were forced downward *pro rata,* thus placing conscientious doctors at a serious disadvantage. In the end, by vote of the physicians themselves, fee-for-service was abandoned. In other countries where fee-for-service has been retained, it has been found necessary to modify this method of payment through combination with capitation or basic payments in addition to proration.

Other methods of payment such as capitation, part-time or full-time salaries, either separately or in combination, provide steady incomes for physicians as compensation for their time and skill. Unlike the "piecework" fee-for-service system, these methods pay amounts which are not directly related to the number of services furnished to sick people. As a result, physicians paid in this manner have an added incentive to keep their patients as healthy as possible, and so to reduce total demands upon their time, especially for the care of sickness. These methods, therefore, encourage preventive

medicine and minimize incentives for unnecessary multiplication of services. In general, they place emphasis upon quality rather than quantity, and upon maintenance of health rather than cure of sickness, as the foundations of the doctor-patient relationship.

At the same time, capitation or salary, if not properly applied, can have certain disadvantages. Physicians may offer too few rather than too many services, or even be led to do indifferent or careless work. They may be tempted, under capitation, to accept larger lists of patients than they can care for adequately. These problems can, however, be solved with less difficulty than those arising from the fee-for-service system. In order to safeguard quality, reasonable limitations should be placed on the number of persons for whom physicians undertake to provide service. The fact that patients would have freedom of choice (and of change) among participating individual physicians and medical groups would furnish a desirable competitive element, far more conducive to high quality of care than is mere competition for large numbers of fees. In addition, good work can be encouraged through supervision of standards of care by appropriate professional committees, locally selected with the advice of participating professional personnel. By removing or minimizing the incentive for quantity inherent in fee-for-service, the program could make careful, deliberate work, rather than the multiplication of services, the principal motivation for a physician to improve his professional and economic status.

The most satisfactory application of capitation or salary is found in group medical practice. In a group, the compensation of each physician depends not only upon his own efforts, but also upon the success of the group as a whole and the judgment of his fellows regarding his contribution to the group's success. The reputation of the entire group is at stake in the satisfaction of patients with the services of all physicians in the group. Under these circumstances, every physician naturally desires to do well in the eyes of both his patients and his fellow-physicians. These motives, which arise from the coöperative (rather than competitive) atmosphere in group medical practice serve largely to offset any disadvantageous effects of payment for physicians' services through salary or capitation.

Whatever methods of compensation are used, highest medical standards require that full payment be made to medical groups, full-time hospital staffs, and other professional teams, in addition to individual practitioners.

Methods of payment to hospitals and other institutions are equally relevant to good quality. All experience indicates that the problems involved in paying for hospital service are complex and difficult. Payment on a per diem rate which is uniform for all hospitals in a given area leads to mediocrity by penalizing the hospital which, in an endeavor to improve services, raises its costs above the average. On the other hand, payment to hospitals on a cost basis, while it gives ample scope for hospitals to improve services, provides no incentive to increase efficiency and keep costs at reasonable levels. The so-called "point-value" system of Agnew[48] attempts to reward quality and thoroughness of service, but has proved unwieldy in the recent experience of the Saskatchewan Hospital Services Plan.[49] Perhaps the best approach would be to pay hospitals on a cost basis, with different ceilings for hospitals providing services of differing scope and standard. No system for paying hospitals is workable in the absence of good cost accounting on a uniform basis.[50] This entire subject requires further study and exploration.

Rates of payment — when flexible, adequate, and appropriately related to

skill, experience, and responsibility—are important elements in the attainment of high standards. Payments should be sufficient but not excessive, in order to improve professional standards and minimize financial competition among health personnel. Rates of payment need not be uniform nationally, but may take into consideration regional variations in standards, as well as varying degrees of qualification on the part of participating personnel. When rates of payment depend upon qualification as a specialist, technician, or the like, the standards for such designation should be objectively established in advance by competent experts in the particular field.

Collection of fees over and above payment received from the organized program for a particular service should not be permitted, if services of equal quality are to be rendered to all individuals and if economic incentives are to be divorced from professional judgments. This, of course, does not exclude payments for services rendered to private patients outside of the plan.

STANDARDS FOR PERSONNEL AND FACILITIES

Objectively determined *qualifications* should govern the participation of general practitioners, specialists, and other personnel. Physician participation should be restricted to those with degrees of doctor of medicine and licenses to practise medicine. Similarly, appropriate educational and licensure requirements are necessary for dentists, nurses, and auxiliary personnel. Standards for medical specialists should be established and administered on the basis of specialty board certification and evaluation by a medical council of the individual's previous performance, standing in the medical community, and demonstrated ability. In so far as practicable, nonmedical practitioners such as optometrists or podiatrists should not be entitled to payment for services except under medical supervision or upon medical referral.

Supervision of professional services by professional persons is essential if the best of care is to be provided. Satisfactory professional supervision has long been an established criterion for approval of hospitals, clinics, and other medical organizations. Visiting teams of specialists in outlying areas, senior staff supervision of hospital work, mutual supervision in group medical practice, professional control of technical and auxiliary services, periodic review of clinical case records by qualified authorities—all such supervisory activities are necessary components of a program of good medical quality.

Proper medical standards imply that each practitioner will have sufficient time to render adequate service to his patients. *Administrative limitations* on the total number of patients for whom a participating physician may obligate himself to furnish care are, therefore, in the interest of good medical service, and should be developed with professional advice and recommendation.

The plan should provide *special incentives* for the settlement of health personnel in rural, depressed, and otherwise undersupplied areas. Such incentives might include specially provided equipment and facilities, loans or grants for initial expenses during the setting up of a new practice, assurance of adequate annual income, functional affiliation with urban resources, and the like. Such special provisions are necessary if the quality of service in outlying areas is to approach the standards of metropolitan medical centers.[51]

Standards for the participation of each type of hospital should also be established by the administrative agency and evaluated periodically with the advice and counsel of appropriate technical groups. A major requirement for hospital participation should be the efficient

organization and operation of the professional staff. Coördination between inpatient and outpatient departments,[52] and between both of these and home care services, is another essential element to be considered in evaluating hospital services. Approval for participation in the national health program should be reserved for facilities meeting at least minimal standards, with hospitals accepted for complete or limited services on the basis of objective qualifications. Financial and technical assistance should be made available to non-approved institutions interested in meeting the standards of the program.

SUMMARY AND CONCLUSIONS

The quality of medical care neither deteriorates nor improves automatically with the mere establishment of a national program of medical care. The standards of service achieved by this—or any—program depend directly upon the human and material resources available, upon their organization for service, and upon the efficiency of their utilization. A poorly designed and badly operated program can—and would—render the provision of good health service impossible. On the other hand, the very nature of a nation-wide plan provides a hitherto unparalleled opportunity for the development of services which can satisfy the highest criteria of good medical care.

Medical care of good quality requires well trained personnel, adequate facilities, and a reasonably comprehensive scope of service.

Highest standards of medical care are achieved only with the wise and efficient organization of these resources. This key factor determines the actual effectiveness of the personnel, the facilities and the services.

Efficient organization of personnel involves group medical practice in health centers; of facilities—regionalized planning for coördinated hospital networks; and of services—continuity through the full range of health care. These emerge, therefore, as the organizational triad most essential to improvement of the quality of medical care.

When sound financing and competent administration provide the firm foundation for such an organizational structure, high standards of service are protected. When provision is made for generous support of education and research in the health services, the constant elevation of these standards is assured.

POSSIBLE HAZARDS FROM THE USE OF DDT

A MINOR panic with respect to possible dangers from the improper use of DDT as a pesticide was created this spring as a result of an article by Dr. M. S. Biskind[1] and by a series of highly sensational broadsides in a New York daily.[2] The latter articles include a statement that "DDT the great bug-killer may turn out to be one of the most devastating biological weapons ever loosed by a people upon themselves." "DDT," it is said, "is slowly poisoning large numbers of Americans, especially children." Dr. Biskind is cited as having observed "hundreds of cases at first hand." Actually, Dr. Biskind says he has found 46 known cases of DDT poisoning *in the literature*; although he assumes that infection classed as due to "virus X" may be really DDT poisoning, and that more than 200 cases of this syndrome have occurred among people in whose homes DDT sprays had been used. Certain individual members of governmental bureaus gave out somewhat equivocal interviews which contributed to further alarm.

That DDT in certain concentrations must be toxic to man is, of course, obvious; and for over five years, P. A. Neal and his colleagues in the National Institutes of Health have been carrying out experiments, both with animals and human subjects, to determine tolerance limits of safety. Furthermore, the U. S. Public Health Service, the U. S. Department of Agriculture, and the Medical Departments of the Army and Navy have had the amplest opportunity to observe actual effects upon the large number of men who have been employed in the application of DDT on a vast scale and who have been exposed to hazards far beyond those which could conceivably affect the ordinary user.

Therefore, it was possible, very soon after the storm broke (April 1, 1949), for a joint group of experts representing the various agencies concerned to issue an authoritative statement on the matter,[3] after a conference at which the Agricultural Research Administration and Production and Marketing Adminis-

tration of the United States Department of Agriculture, the Office of the Surgeon General of the Army, the Food and Drug Administrator, and the U. S. Public Health Service of the Federal Security Agency, the Bureau of Medicine and Surgery of the Navy, and the Pan American Sanitary Bureau were represented.

This statement pointed out that the toxicity of DDT for man "has been given full consideration in making recommendations for its use. There is no evidence that the use of DDT in accordance with the recommendations of the various federal agencies has ever caused human sickness due to DDT itself. This is despite the fact that thousands of tons have been used annually for the past four or five years in the home and for crop and animal protection. However, minor toxic symptoms may be produced by kerosene and various solvents used in DDT and practically all other insecticidal mixtures.

"Statements that DDT is responsible for causing the so-called 'virus X disease' of man and 'X disease' of cattle are totally without foundation. Both of these diseases were recognized before the utilization of DDT as an insecticide." It may be added that the distribution of these diseases shows a striking lack of concordance with the use of DDT in various sections of the country, that the symptoms of disease alleged to be caused by DDT are generally of the vaguest character (intestinal disturbance, headache, sore throat, fatigue); and that in the few cases where serious results followed from gross carelessness (drinking a whole bottle of insecticide), there was frequently enough solvent ingested (kerosene, in the case cited) to cause fatal results by itself.

There is a further possible problem involved, however, in the fact (demonstrated by the U. S. Department of Agriculture in 1945) that DDT tends to accumulate in the fatty tissues of exposed animals and to be excreted in the fat of milk. DDT can sometimes be detected in small amounts in cow's milk following the use of this insecticide in dairy barns. In view of this potential hazard, the U. S. Department of Agriculture had recommended on March 24 that DDT should not be used in dairies.[4] In April it urged[5] that "this insecticide not be applied to animals producing milk for human consumption. In the light of current information the Bureau also advises that safer materials be used for insect control in places where the milk might be contaminated, such as dairy barns, milk rooms, rooms containing dairy feed, or in similar situations on the farm. Nor should DDT be used for fly control in milk-processing plants. Further investigations are under way to determine whether DDT carefully applied in dairy barns and other situations mentioned can be used without causing significant contamination of the milk." It would seem desirable to obtain more extensive data as to the actual presence of DDT in milk by methods now available[6]; but, all in all, the situation seems to be well in hand and the public adequately protected.

The writer of this editorial is reminded of the controversy which took place some years ago with regard to the use of tetra-ethyl lead in gasoline. There was a real menace here and so many serious cases of poisoning occurred in the plants where tetra-ethyl lead was prepared that the product was voluntarily withdrawn from the market, pending studies by a board appointed by the U. S. Public Health Service. These studies indicated proper safeguards (such as the warning signs still posted at every filling station); and the application of these safeguards has made the use of this poison possible without any threat whatever to the public health. In the case of DDT most of the necessary data are already in hand. The use of this substance in dairy processes may properly be limited for the present;

but there is no scientific evidence to indicate the need for other restrictions (except those already in force).

ADVANCES IN ANTIBIOTICS RESEARCH

THE second national symposium concerning recent investigations in the field of antibiotics was held under the auspices of the Antibiotics Study Section of the National Institutes of Health in Washington, D. C., on April 11 and 12. Because of the importance of antibiotics in the public health program, the results of this conference are of importance to all of us.

Eight papers were presented on streptomycin, dealing with chemical methods of assay, the development of resistance, and the effect of the anionic portion of the molecule of streptomycin and dihydrostreptomycin on the development of resistance. Another series of reports was presented on synergism, resistance, and the therapeutic use of antibiotics. In this group of communications, some of the pharmacological properties and comparative activities of the newer antibiotics, actidione, polymyxin, aureomycin, chloromycetin, and bacitracin were discussed.

The intensive search for antibiotic substance was demonstrated in the evening session of April 11, when 12 papers were presented describing new compounds of this type. The new antibiotic, borrelidin from a streptomyces species, was described. Antibiotic substances from the sweet potato, the banana, the Indian carrot, hops, and seed plants were reported. Two antifungal agents, one from subtilin broth, the other called "xg" isolated from a streptomyces species, as well as the most recent discovery of Waksman, "Neomycin," were described in detail. A variety of studies were presented on the polypeptide antibiotics, particularly bacitracin, polymyxin, circulin and subtilin, none of which, incidentally, have yet been modified sufficiently to obviate the inherent toxicity of these drugs. It appeared to be the consensus of opinion that the polypeptide antibiotics are inherently nephrotoxic, and that their usefulness for parenteral administration can probably be answered only by a modification of the molecule.

The highlight of the symposium was a series of 17 papers describing the usefulness, pharmacology, physical and chemical characteristics of aureomycin and chloramphenicol. These two drugs, which are now available on the market, are the first antibiotics demonstrated to be effective against certain of the rickettsial and viral diseases. Chloramphenicol is the first major antibiotic to be synthesized on a commercial basis. The method of synthesis and the structure of this drug were described during the symposium. It was shown to be useful in the treatment of Rocky Mountain spotted fever, scrub typhus, typhoid fever, brucellosis, Gram-negative bladder infections, and primary atypical pneumonia. Aureomycin, on the other hand, appears to be a much more complicated compound, and although prepared commercially as a crystalline drug, it has not been synthesized. Both drugs are used orally rather than parenterally. Aureomycin was shown to be useful in the treatment of Rocky Mountain spotted fever, typhus, scrub typhus, primary atypical pneumonia, staphylococcic, streptococcic, and pneu-

mococcic pneumonia, brucellosis, and certain staphylococcic infections. During the discussions it became clear that an even broader field of usefulness for this drug is possible, since evidence appeared to be accumulating that aureomycin may be useful in the treatment of infectious mononucleosis, certain types of syphilis, lymphogranuloma venereum, and granuloma inguinale.

It is the function of the Antibiotics Study Section of the Division of Research, Grants, and Fellowships of the National Institutes of Health to promote, develop, and correlate research in the antibiotics field, and, during the past two years, considerable sums of money have been granted to individuals throughout the country to make it possible for them to continue studies on antibiotics. Investigations in this field have moved rapidly, and since it is difficult or impossible for the national societies to sponsor broad symposia exclusively for antibiotics, and since it is most important that the recent advances in antibiotics be brought to the attention of those vitally interested in this field as promptly as possible, it has been planned by the Antibiotics Study Section to sponsor symposia on antibiotics research at periodic intervals in the future.

TRYPANOSOMIASIS

THE continent of Africa now represents one of the major hopes of the world—so far as the development of new natural resources is concerned. There is much yet to be done, through planning and conservation, in Asia, in South America and even in the United States. Africa is the only continent which many observers believe has truly vast potentialities waiting to be tapped. How sound this view may be, only time can show. For Belgium, France, and the United Kingdom, the problem is certainly of pressing importance.

The chief obstacle to development in many areas of Africa is a public health problem—that of trypanosomiasis. Half a dozen different species of trypanosomiases are involved and they are transmitted by as many or more species of biting flies (most often of the genus *Glossina*). Parasites, natural reservoirs and insect vectors vary widely in different regions; and control methods must vary correspondingly. In general, the basic reservoir is to be found in the wild fauna, the big game of the African continent which normally harbor the trypanosomes without suffering from the disease. The *Glossina* carries infection to domestic animals and to man (if the particular trypanosome present can live in the human body). Serious epidemics among human beings have occurred, as in the great epidemic in the Lake Victoria region half a century ago. The devastating influence of trypanosome infection on cattle and pigs and hence on the general economic status of the population is also, however, a vital practical problem. "Vast areas of Africa are empty except for the tsetse fly and wild animals, which supply the insect with food. There is evidence that in many parts of Africa the fly is spreading, thus squeezing man into smaller and smaller areas, with consequent food shortage and soil erosion."

The importance of this problem caused the calling of an international congress on trypanosomiasis at Lagos during the war. At a conference held in French Equatorial Africa in February, 1948, an International Scientific Committee for trypanosomiasis was created which held its first formal meeting in London in February of the present year.

Practical methods of combating trypanosomiasis have been developed along two major lines of attack, directed, respectively, against the tsetse fly and against the trypanosome itself.

The insect vectors breed in areas covered with shading bush or thicket. Clearing the bush has been effective in *Glossina* control in certain areas, but on a wholesale scale would be impracticable over thousands of square miles. After the bush is cleared the ground must be occupied and cultivated quickly and continuously since scrub and trees in Africa reoccupy temporarily cleared territory with alarming speed. The destruction of the wild game, which is the primary reservoir of infection, has been successful in certain areas of Southern Rhodesia; but again, is impracticable in a vast continent. Finally, the use of insecticides, such as DDT and gammexane, applied by smoke bombs or by apparatus attached to the exhaust of an airplane has given promising results in an experimental area of South Africa. The same principle is now being extensively applied in certain parts of East Africa.

A second line of approach involves the control of the trypanosome by the use of specific drugs which destroy the parasite in the human or animal body. In treatment of cattle a wide variety of substances have been used for this purpose such as antimony compounds, quinolin compounds and phenanthridinium compounds. The last named (dimidium bromide) has been used with effectiveness in Zululand and the Southern Sudan. Antricyde is the most recent addition in this field. For the human being, new drugs are available (antrypol and tryparsamide, and—more recently—pentamidine) which have great promise. Pentamidine, as claimed by workers in the Belgian Congo, will protect man from sleeping sickness for eight or nine months after a single injection; and Antricyde is said to protect cattle against infection for four to six months.

If these claims should prove justified, the status of both men and domestic animals in Africa may be vastly improved. The *British Medical Journal*[1] has, however, pointed out the danger of premature optimism. Its editor points out that there are many variables involved in different areas which "include the species and strains of trypanosome, the species of tsetse common in the area, the presence of big game, the prevalence of other epidemic diseases, the psychological make up of the African." He says, in connection with the last point: "How closely trypanosomiasis is bound up with the culture patterns of each tribe is shown by a consideration of the village pond, anathema to the sanitarian because it provides all-the-year breeding conditions for mosquitoes and tsetse flies. For the villager, however, the pond provides green plants, which, when reduced to ash, are essential as a source of salt. In some areas the ponds contain fish; these are sacred, for either the lives of particular fish may be connected with the lives of particular villagers, or the fish may house the souls of the ancestors. In other areas the banks of the pond form the local latrine, and the fish eat up the fecal matter. Any interference with the village pond may thus have serious repercussions."

In spite of all difficulties it will be surprising if the new methods of attacking tsetse flies and trypanosomes now available do not bring substantial results. Whether—and how soon—the results of rescuing the people and the domestic animals of Africa from trypanosomiasis will increase the food available for other continents, is a more problematical question. The days of imperial exploitation of backward peoples are past. The *British Medical Journal* expresses the sense of grave responsibility which inspires present-day British policy toward its de-

pendencies in closing with the query, "How far are Western European nations, comparatively well fed by African standards, justified in removing from Africa first-class proteins in the shape of meat and eggs when African populations are still living on diets that are grossly deficient in proteins?"

HOSPITAL DELIVERY AND INFANT MORTALITY

THE statistical relationship between infant mortality rates in 973 cities of the United States and certain socio-economic indices for those cities is the subject of a brief but highly suggestive study by Altenderfer and Crowther.[1] The four factors analyzed were the median size of the city, its per capita income, the percentage of white persons in its population, and the percentage of births taking place in hospitals. Zero order correlations were negative and considerable, in all but the first of these indices. When the factor of hospitalization was held constant, the first order correlation with race and income fell to a level which was without statistical significance. When—on the other hand—either the race factor or the income factor was held constant, the first-order correlation with hospitalization remained between .47 and .49. When both the factors mentioned were held constant, hospitalization still maintained a significant second-order correlation of .41. The authors conclude that, in the areas studied, "the association of low infant mortality with high per capita income and with high percentage white is a consequence of the association of high values of these factors with high percentages of births hospitalized. The high correlation between infant mortality and percentage of births hospitalized does not necessarily indicate a causal relationship. It is not hospitalization in the narrow sense of the word but the concomitant circumstances—such as an aseptic environment, the availability of skilled care and of facilities for dealing with emergencies, and the better prenatal care usually associated with hospitalization—that save many infant lives. The components of maternity care are difficult to evaluate individually but hospitalization at delivery is an index of the utilization of the best available care."

This study is sufficiently important to warrant careful evaluation and repetition with other data which may be available. On the face of it, the investigation suggests that our general policy of fostering the practice of hospital delivery is a sound one; and that the skepticism on this point which is occasionally expressed is not justified.

Clearing House on Public Health Salary Information and Personnel Needs

SECOND ANNUAL STUDY OF LOCAL HEALTH DEPARTMENT SALARIES

A body of data about public health salaries is being rapidly built up. The second report on "Salaries of Local Public Health Workers" made by the U. S. Public Health Service in coöperation with the American Public Health Association and the Association of State and Territorial Health Officers, has just been released with an April date line. The previous one was published in May, 1948, and discussed in the October clearing house (*A.J.P.H.* 38, 10:1452 (Oct.), 1948). The first report was based upon 236 local health departments serving populations of from 50,000 to 250,000 in 38 states; the current one on 253 similar departments in 37 states. Two studies of state health department salaries have also been published and discussed in the clearing house (*A.J.P.H.* 38, 5:576 (May), 1948; and 39. 1:79 (Jan.), 1949).

Perhaps the most significant single fact in the latest study of local salaries is that, on the basis of the lower limits of the median salary ranges, there has been an average increase in salaries of 10 per cent during the last year.

Below are shown the number of workers in seven categories reported in the two studies, together with the number of states and number of health departments represented in each category.

At the time of the earlier study 6 health officers were reported receiving $9,600 or more annually; in the current study the number was 17. In the earlier study 7 were reported receiving less than $4,800; currently that number has dropped to 5. Eight sanitary engineers are reported in the current study to be receiving $6,000 or more annually as against none in the earlier report. However, 18 were receiving less than $3,000 as against 15 in the earlier study when a slightly larger total number of sanitary engineers was reported. The number of sanitarians receiving $4,800 or more increased from 3 to 6 during the year, and those receiving less than $2,400 dropped from more than one-fourth to less than one-sixth of the total.

The number of supervising nurses receiving $4,200 or more increased from 10 to 23 and only one received less than $2,400, although in the earlier year there had been 10. The number of staff nurses receiving $3,600 or more increased from 17 to 54 and those receiving less than $2,400 decreased from one-third to one-fourth of the total. Three professional laboratory workers were reported receiving $6,000 or more annually in the current study and the number of those receiving less than $2,400 decreased from 27 to 12 per cent of the total during the year.

In studying this brief summary or the

	Number Reporting					
	States		Health Departments		Number of Workers	
	1948	1949	1948	1949	1948	1949
Health officer	34	37	191	223	191	223
Sanitary engineer	25	23	92	71	114	105
Sanitarian	38	37	212	244	956	1,219
Professional laboratory worker	23	34	84	110	179	193
Supervising public health nurse	36	35	159	165	239	232
Staff public health nurse	37	37	224	250	1,648	1,963
Public health educator	16	19	36	56	39	63

more detailed report, it must be remembered that these are local health departments serving populations of from 50,000 to 250,000. Therefore it is hardly to be expected that the medians or ranges of salaries will apply to such metropolitan areas as New York City with its five counties, Philadelphia City and County, Los Angeles, San Francisco City and County, Detroit, and others.

The detailed report has already been distributed to all state and local health officers. Copies for further limited distribution are available from the Committee on Professional Education, American Public Health Association, 1790 Broadway, New York 19.

N.O.P.H.N. RECOMMENDED SALARIES FOR PUBLIC HEALTH NURSES

The Board of Directors of the National Organization for Public Health Nursing has endorsed recommended beginning salaries for 7 grades of typical public health nursing positions. These recommendations were prepared by a subcommittee on salaries of the organization's Committee on Nursing Administration and were published in the agency's magazine, *Public Health Nursing*, April, 1949. The recommendations point out that positions may vary in different agencies and that there may be variation from the recommended minimums in relation to cost of living, experience, and qualifications, etc.

The table shown gives the recommended minimum beginning annual salaries for the seven positions. Included in the recommendations but not reproduced here are two other items, namely, the qualifications for each grade of position and a job description.

Reprints of the article giving the detailed recommendations are available from the National Organization for Public Health Nursing, 1790 Broadway, New York 19.

THE SALEM EXPERIMENT

It is Salem, Mass., though there is an apocryphal tale that Salem, Ore., once brashly asked its much older namesake to change its name to avoid mail mixups. At any rate, the New England Salem is the guinea pig in an experiment in developing public opinion for a long-range attack on the problem of informing citizens about public health.

Position	*Recommended Minimum Beginning Annual Salaries*
Registered Nurse	$2,700
Public Health Nurse, Grade I	3,000
Public Health Nurse, Grade II	3,600
Public Health Nurse Supervisor or Public Health Nursing Director in agency with fewer than 10 nurses	4,200
Public Health Nurse Consultant, not fully qualified	4,500
Public Health Nurse Consultant, fully qualified	5,500
Public Health Nursing Assistant Director or Public Health Nursing Director in agency with from 10 to 50 nurses	6,000
Public Health Nursing Director in agency with 50 or more nurses or State Director of Public Health Nursing	7,500

Based on the fact that today's students are tomorrow's voters and legislators—and workers—the Salem project is an experiment in training high school students in the elementary concepts of community health. In a "Suggested Guide to Health Teaching in the Senior High School" being prepared, a unit entitled "Health Professions and Agencies at Work" was included. Since much of the material in it was untried as teaching material, the unit was taught to a group of seniors in the Salem High School as a part of the course in "Problems of Democracy." The first lesson made use of two current articles, "The Shame of Our Local Health Departments," from *Collier's Magazine*, which is a broad national look at the local health picture, and a *Boston Herald* article, "Nashoba Unit Pioneering Way to Good Health at 40 cents a Person," which is a story of the way one Massachusetts community is providing local health services.

This whole pilot experiment is written up in the April, 1949, *Health News* of the Massachusetts Department of Public Health, by a state district health educator and a director of social studies in the high school. It is pregnant with suggestions for recruitment as well. As high school youngsters know more about public health services and their importance, they will also tend to join the ranks of its workers. The summary of the pilot experiment says "When the teacher helps his students to discover, define, and explore their own needs and those of their community, high school boys and girls will enter into this experience with spontaneity, interest, and energy to produce understanding and lasting interest in this relatively new area of public health."

AN EXAMPLE OF CITIZEN INTEREST

If there is a profession in which there is a more critical shortage of personnel than public health, it is the teaching profession. And already, for several years, the National Education Association, the professional organization, and many other agencies have been pounding away at the low salaries and untoward personnel practices that have been steadily depriving the profession of some of its best practitioners.

Now a National Citizens' Commission for the Public Schools has been formed, under the chairmanship of Ray E. Larsen, who is President of Time, Inc., and of the United Hospital Fund of New York.

The commission has received initial financial support from the Carnegie Corporation and the General Education Board. The present membership is 28, later to be increased to 60. These 28 represent newspapers, magazines, business firms, labor, farm organizations, public relations as well as educational organizations.

A full-time educational consultant will be employed, assisted by an advisory board of educators. It will act as a clearing house of information on public school problems for local groups. The commission's program calls for citations of groups of laymen who have made exceptional progress in improving their local public schools, and outstanding achievements of good public schools may later be chosen for public citation.

Who will organize a National Citizens' Commission for the Public Health Departments?

THE OREGON ALARM RINGS

The President of the Oregon State Board of Health, Dr. Charles E. Hunt, by way of a letter to the Ways and Means Subcommittee of the Oregon Legislature, has called for action to avert a serious breakdown of public health control because of the Board's inability to recruit and retain personnel at the low salaries authorized by the state. Said Dr. Hunt, "The Board is not only unable to pay salaries com-

parable to those paid in private enterprise and in our neighboring states of Washington and California, but it actually cannot compete with counties of our own state in recruiting specialized personnel." There are five key vacancies in the State Health Department, one of almost five years' standing.

Take a Test

The Merit System Service booth at the American Public Health Association annual meeting in Boston attracted considerable attention with its "TAKE A TEST" exhibit. This consisted of six short sample tests, designed to illustrate the type of service being offered by the Merit System Service and to show how public health information, experience, and judgment can be measured by objective examinations.

The exhibit was repeated at the Western Branch meeting of the American Public Health Association in Los Angeles, Calif., May 30 to June 1.

The results for the Boston meeting are available in an attractively bound report which contains copies of the six sample tests, an answer key, an analysis of the scores of the persons tested, and an analysis of the items themselves. The latter illustrates the method which is used to evaluate the effectiveness of individual questions. The report may be obtained by writing to the Merit System Service, American Public Health Association, 1790 Broadway, New York 19, N. Y. $1.00.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted.

Cooperation for Rural Health—*By Helen L. Johnston. Washington, D. C.: U. S. Dept. of Agriculture, Farm Credit Administration (Miscellaneous Report 123)*, September, 1948. 55 pages. Processed.

This is a booklet on group prepayment plans for medical care addressed primarily to farm people. It is illustrative of a significant body of literature coming from agricultural agencies in response to the demands of rural leaders.

The federal Farm Credit Administration is concerned, among other things, with assisting farmers' marketing and purchasing coöperative associations. For some years these associations have applied coöperative principles to the purchase of medical and related services, and Miss Johnston has made on-the-spot studies of numerous such programs. Her booklet describes the structure and function of these programs under a pragmatic (rather than logical) classification: hospital service plans, insurance company plans, and coöperative health associations. Sufficient detail on the operation of different plans is given to implement a brief section on Suggestions for Rural Health Improvement Programs.

The booklet closes with an appendix on specific steps to be taken in studying the needs and resources of a rural community to provide the basis for organizing programs to improve medical services. In the effort to achieve simplicity, there is some rushing into problems where angels fear to tread, especially in the discussion of health service planning beyond the sphere of prepayment programs. As an easy-to-read manual on group medical care insurance plans, however, the booklet should be useful to rural leaders and possibly to public health workers from whom farm organizations seek advice.

MILTON I. ROEMER

Nursing of the Sick—1893—*By Isabel Hampton and others. Published under the sponsorship of the National League of Nursing Education. New York: McGraw-Hill,* 1949. 218 pp. Price, $3.50.

Whether you like history or not, the reader will not be able to browse through this collection of papers and discussions of nursing from the International Congress of Charities, Correction and Philanthropy (Chicago, 1893) without smiles of amusement, moments of pride. and a deeply moving sense of the progress of nursing over the last half century. Here are not only famous names, but penetrating observations and keen understanding of the needs of patients, the goals of nursing and the responsibilities of administrators which change little over the years. A study of these earlier opinions and experiences puts our current problems in a clearer light, and frequently an amazingly modern-sounding phrase leaps from a page, as—Miss Wald: "Why should a training school or hospital have the right of deciding what a nurse shall charge? [For her services to private patients.] She should have the privilege of setting her own price. It is as much professional work as that of the physician." (Page 104.)

The description of nursing techniques, positively victorian in atmosphere, is rewarding in an occasional practical and still timely suggestions, while the procedures routinely carried out in ob-

stetric care will cause shudders of dismay in the light of our present practice.

Nurses who are interested in psychiatric nursing will enjoy Miss May's report (page 176). Mrs. Kinney's address on the training of attendants (the last in the book) is enlightening, and public health nurses will not want to miss the six or seven papers dealing with district nursing. Here, too, comparisons are inevitable as we read of experienced visiting nurses paid $50 a month and special nurses supplied for "contagious cases."

The League and McGraw-Hill are to be congratulated for reopening this rich mine of nursing history.

DOROTHY DEMING

Modern Trends in Public Health —*Edited by Arthur Massey. New York: Hoeber,* 1949. 549 pp. Price, $12.50.

The student of "social medicine" in Great Britain today should find a store of his country's distinguished history, leadership, and accomplishment in the packed pages of this contemporary summary by well qualified authors. The undergraduate student of medicine in England could do no better than rely upon the 73 chapters as basic for his course in preventive medicine and public health.

The topics are well chosen, though not intended to be inclusive or presented with the detail and technology required by the graduate specialist in administrative posts.

Of these chapters a half dozen deal with various of the more recent trends in thought and social experience for health: The Idea of a Family Health Club; Social Medicine as Academic Discipline; General Practice and its contribution to Preventive Medicine; Combat with Atmospheric Pollution; Chronic Rheumatism as a Public Health Problem; Housing and the Home, the New Outlook.

If one were to select chapters for special praise in the matter of content, form, and spirit, those by Parry of Bristol on Health Centers; by Stocks on Vital Statistics; by Stewart on Occupational Health; by Sutherland on Health Education; by Tattersall on Tuberculosis; and by Williams of Southhampton on Health Control at the Ports are particularly satisfying.

The book will serve a good purpose for the many who take a cultural rather than technical or professional interest in the application of the sciences of preventive medicine for social ends.

A number of social movements of concern to American readers are not dealt with, but most of the indispensables of public health service and participating medical practitioners are treated systematically and in suitable detail within the limits of the 549 large and well printed pages. An index is clear and convenient. This monograph has the blessing of Sir Wilson Jameson. The editor, Dr. Massey, has put public health readers in his debt.

HAVEN EMERSON

Recent Advances in Respiratory Tuberculosis—*By Frederick Heaf and N. Lloyd Rusby (4th ed.). Philadelphia: Blakiston,* 1948. 290 pp. Price, $5.50.

In the first three editions of this book, the original author, Dr. L. S. T. Burrell, presented a predominantly clinical review of the subject for general practitioners and medical students. The authors of this fourth edition have followed the same pattern because they "have felt that the subject Respiratory Tuberculosis could best be presented as a consecutive narrative with the new developments engrafted upon a background of the ideas and conceptions previously held."

The book is thus largely a manual or synopsis of the general principles of the pathogenesis, diagnosis, treatment, and prevention of tuberculosis, rather than being primarily an account of "recent

advances." Within this scope, the presentation on the whole is adequate. Because it *is* predominantly clinical in character, it might be useful chiefly as a reference on this aspect of tuberculosis.

Epidemiological data and the principles of the modern tuberculosis control program are presented almost entirely with reference to conditions in Great Britain. EDWARD X. MIKOL

Social Work Year Book, 1949 *(10th ed.)—By the Russell Sage Foundation. New York: Russell Sage,* 1949. 714 pp. Price, $4.50.

It would be helpful if more public health workers became thoroughly familiar with this book which is published biennially as a concise encyclopedia descriptive of organized activities in social work and related fields. The present edition, the tenth in the series, like its predecessors, contains two main divisions, the first consisting of 79 signed articles written by authorities on a variety of topics, and the second consisting of four directories of agencies whose programs are integral with or related to the subject matter of Part I.

Topical articles on subjects of special interest in public health include that on medical care by Dean A. Clark and Katharine G. Clark; on social hygiene by Walter Clarke, M.D.; on public health nursing by Anna Fillmore, R.N.; on sight conservation by Winifred Hathaway; on the crippled by Lawrence J. Link; on mental hygiene by Thomas A. C. Rennie, M.D.; on public relations by Mary Swain Routzahn; on public health by Leonard A. Scheele, M.D.; on medical social work by Theodate H. Soule; on chronic illness by Milton Terris, M.D.; on maternal and child health by A. L. Van Horn, M.D.; and on school health services by Charles C. Wilson, M.D.

The book is particularly well suited for those seeking a broad view of current affairs in this field, for example, such as students and overseas visitors in the United States. It is a volume for daily reference on the desk of the administrator.

REGINALD M. ATWATER

Health Teaching in Schools— *By Ruth E. Grout. Philadelphia: Saunders,* 1948. 320 pp. Price, $4.00.

This time the saying, "you can't judge a book by its cover," is incorrect. The cover is but a foretaste of the excellence of the product within. In fact the cover is so compelling that one must pick up the book for a closer inspection when it is first seen.

Health Teaching in Schools enables the prospective teacher or the teacher in service to gain an understanding of the health needs of children, and how these needs may be used as a basis for the health education program.

Emphasis throughout is on the application of sound educational philosophy and method in the development of the health education program. The relationship between school and community is stressed. Particular attention is given to the role of community resources which can contribute to the school health program.

The practical aspects of health teaching in the classroom are discussed in two chapters, Guides to Health Teaching in Elementary Schools, and Guides to Health Teaching in Secondary Schools. The text contains abundant examples from all parts of the country to illustrate the application of accepted educational methods.

Chapter VIII on audiovisual materials in health education not only discusses their place and use in the school health program, but also where these materials may be obtained.

Under the title Co-Workers in Health Education is presented a summary of all the persons, organizations and agencies, official and voluntary, local, state

and national, that have any relation to the school health program. The point of view expressed in this chapter can best be presented in the words of the author: "Health education is a function of many individuals and groups within the school and community aside from the teachers themselves. . . . Only as each citizen participates actively in personal and community health betterment and only as groups learn to pool their resources through unified efforts, will the community's most urgent health problems be met. No one individual or agency alone can accomplish these ends. All must be co-workers on a united front."

Format, paper, and printing are good.

This book is a valuable addition to health education. It should find many uses in the expanded teacher education program in health education.

S. S. LIFSON

The Quest for Pure Water—*By M. N. Baker. New York: American Water Works Assn.,* 1948. 527 pp. Price, $5.00.

Do you know that records almost 4,000 years old recognize the efficacy of boiling water to make it safe to drink? What did the biblical Mosaic laws have to say about water purification? Who were the pioneers in water purification in the United States? When was water softening first undertaken on a full municipal level in the United States?

This volume by Mr. Baker will answer many more questions than those asked above. It is the history of water purification as compiled by him during many years as Associate Editor of *Engineering News Record,* as he found it in engineering history from many parts of the world, and as related to him by individuals from firsthand experiences and records.

It is not a textbook of water treatment. Rather, starting with records that go back to early Sanskrit, it carries the story of water purification through Europe and the United States, from slow sand filtration to rapid filtration, from softening to the elimination of tastes and odors. It will save hours of research time for those who are looking for background material, and prove fascinating reading to anyone interested in safe water supplies. It is generously illustrated and thoroughly documented.

FRANCIS B. ELDER

The Commonsense Psychiatry of Dr. Adolph Meyer—*Edited by Alfred Lief. New York: McGraw-Hill,* 1948. 677 pp. Price, $6.50.

This book is much more than an edited compilation of the writings of Dr. Adolph Meyer. While it brings together 52 selected papers by Meyer and creates a source book where the student may for the first time find the basic writings of Meyer, it is also the biography of a great man.

Through skillful organization of his material the author presents the development of Adolph Meyer through his experiences, his action, and his thinking. The volume is divided into sections dealing with successive phases of Dr. Meyer's career, his early life in Switzerland, his education and training in Europe, the various positions he held in Illinois, Massachusetts, New York, and, finally, at Johns Hopkins in Baltimore. In each of these there is a preliminary account of the circumstances of his work, the things he accomplished and something of his associates. Following are selections of the articles written by Meyer in their particular period. It is fascinating to watch the growth in thinking of a man as portrayed in his own writings, organized, however, by an able biographer in such a way as to be correlated with the time and place and events of the subject's life.

The volume is, however, more than a biography, more than a collection of papers. It is a history of the develop-

ment of psychiatry and mental hygiene in this country. It is not strange that this should be so, for in one way or another, Meyer was connected with every major development in these fields during his lifetime.

While the book will have great interest for professional people working in the field of psychiatry, it should appeal also to all those who enjoy well written biography. Alfred Lief in this biography of a distinguished psychiatrist has added another to his list of similar achievements.

JAMES M. CUNNINGHAM

Your Teeth: How to Save Them —*By Herbert Yahraes. New York: Public Affairs Committee,* 1949. 30 pp. Price, 20¢.

This is a very up-to-date booklet giving the latest information on dental health. Its chapter make-up is good and each one is complete in the information it offers.

It is too long for the average parent to read and should not be distributed through this channel. Its language in many instances is also a bit too technical and would discourage the average parent from reading; however, there is always a special need for material of this kind in certain parent groups where the educational level is particularly high and the trend is toward study group programs.

Technical material of this type organized as a complete unit in a pamphlet of this kind has many suggested uses in the field of dental health education. Public health nurses can assimilate much added information for use in their work. Teacher training institutions, college health courses, and nurse's undergraduate and postgraduate training schools could make excellent use of this pamphlet in their curriculum planning.

Never to be neglected is the excellent possibility this booklet offers teachers as a reference source in classroom study where units of dental health may be formulated or assigned. These outlets for use of this material make it an excellent adjunct in the field of dental health education and it serves a definite need. L. A. GERLACH

Safer Ways in Nursing to Protect against Tuberculosis — *Prepared by the Joint Tuberculosis Advisory Service of the National League of Nursing Education, National Organization for Public Health Nursing, and the National Tuberculosis Association, New York.* 1948. 108 pp.

This satisfying complete, practical, and accurate handbook is an outstanding example of what happens when national organizations pool their knowledge and write for the nurse in the field —wherever she may be—home, hospital, or clinic. The fundamental principles are discussed, defined, applied, adapted. Every nurse—and this is for once an all inclusive statement—should read and use the directions in this handbook and then keep them on hand for ready reference. An attendant who follows these suggestions conscientiously may be assured that he or she is carrying out every known precaution to prevent the infection of himself or others. The handbook is well documented for those who wish to check the facts or read further in a subject, and it contains concrete lists of equipment, formulas, and sources for purchase of materials. Altogether a masterly, universally needed contribution to safer nursing ways.

DOROTHY DEMING

Your Baby—*By Gladys Denny Shultz and Lee Forrest Hill. Garden City, N. Y.: Doubleday.* 1948. 278 pp. Price, $3.50.

Shultz and Hill have restored to the infant and preschool child the male parent. He gives the first bath to the new-born. There are jobs for him dur-

ing breast feeding on the self-demand schedule. He plans the daily work schedule with the mother. He is needed to arrange living quarters and play areas.

This book correlates child development with psychological implications. Fluctuations in appetite are connected with rate of growth. Peculiarities of food likes and dislikes of preschoolers are clarified. Repeated respiratory infections are explained as a means of increasing immunity.

The presentation on habit training may be confusing. The daily schedule includes toileting at the age of 7 months, although it is stated that sphincter control develops at 24 months of age and that self-training is preferred. The effect on posture of the recommended stomach sleeping and confinement to play pens is debatable at present. Although "rooming-in" is advocated for the future, we should like to have had natural childbirth mentioned also.

This book is beautifully illustrated and has space for the record of one child. Its emphasis on paternal participation in child care is to be commended. HARRIET E. NORTHRUP

Measurements of the Public Health—*By F. A. E. Crew. Edinburgh, Scotland: Oliver and Boyd,* 1948. 237 pp. Price, 18s.

This book presents interesting vital statistics of the population of Scotland, together with their interpretation by the author. It contains a wide variety of charts, graphs, and tables in its eight chapters. The rates and ratios are grouped by chapter to cover population, birth and fertility rates, illegitimacy, multiple births, sex-ratio, marriage, biology of death, and stillbirth, infant mortality and maternal mortality.

The rates and ratios given are indeed good standards by which the health status of a given area can be measured. The interesting and valuable knowledge gained from age-specific deaths of tuberculosis, for example, is well known. The author, therefore, by careful analyses of such data has rendered a worthwhile service to those in Scotland who have responsibilities in public health administration, or "Social Medicine" as it is designated by the author.

Students of the measurements of public health would be interested in the *Evaluation Schedule* of the American Public Health Association and the current research on its validity as another instrument for measuring an area's health status and accomplishments. The *Evaluation Schedule* which is now in its 29th year as a measuring device selects much different criteria. The *Evaluation Schedule* is believed by the reviewer to be a more rounded instrument in that it includes an evaluation of such criteria as immunization levels, the status of basic environmental sanitation and the like, and to some extent, of public health practice.

ROBERT E. ROTHERMEL

Experimental Immunochemistry—*By Elvin A. Kabat and Manfred M. Mayer. Springfield, Ill.: Thomas,* 1948. 551 pp. Price, $8.75.

This book brings together, for the first time methods which have been useful in providing quantitative results in the field of immunology. The subject of experimental immunochemistry is presented in 4 parts. In Part I are discussed clearly and concisely the definitions and methods of immunology: precipitin reaction, agglutination, complement, complement-fixation, anaphylaxis, and the characterization of antibodies. Part II describes uses and applications of quantitative immunochemical methods to many problems. Part III is devoted to a compilation, with descriptions, of methods of characterizing substances in which an immunologist may become interested. Included are 11 sec-

tions on procedures for determination of various chemical groupings, 7 sections on methods of studying the physical properties of substances, as well as sections covering other procedures ordinarily carried out by the immunochemist. Some methods are given in a sketchy manner, but all are well documented with references to the original articles. Part IV deals with preparations of individual proteins, polysaccharides and related substances whose immunological behavior has been studied. Finally an appendix is included which gives details regarding minor points of technique.

The book is well written and contains an abundance of tables and figures which are taken from reference articles and show data obtained by the experimental method under consideration. While it does not cover the theoretical aspects of immunology, the book does provide a stimulating array of methods for the study and use of antigens and antibodies by the chemist as well as the bacteriologist and immunologist.

GEORGE A. HOTTLE

District Nursing. *A handbook for district nurses and for all concerned in the administration of a district nursing service—By Eleanor Jeanette Merry and Iris Dundas Irven. Baltimore: Williams and Wilkins,* 1948. 266 pp. Price, $4.00.

This little handbook, designed primarily for public health nurses in Great Britain, is of deep interest to public health workers on this side of the Atlantic where conditions are so different. The book provides an overall picture of public health nursing procedures, and includes chapters on public health administration, public health legislation, and social insurance. The authors are brief and concise, and have outlined their material clearly. To the general reader, they may seem somewhat didactic, and, in a few instances, accuracy has been sacrificed to brevity. The chapter on Family Health Teaching contains many helpful ideas for the public health nurse in the home and in the clinic. The discussion on midwifery and maternity is also extremely helpful.

The book is well illustrated with photographs selected to show public health nurses at their work and to supplement the discussions. There are also some excellent sketches showing the necessary equipment in the home for such procedures as administration of insulin or for a surgical dressing. Copies of various record forms and printed instructions are included, and will prove interesting to the reader.

The authors are well equipped, both by preparation and experience to prepare such a handbook, and throughout their work there is a note of kindly understanding and appreciation for what the public health nurse is trying to do in her work with the families assigned to her care. KATHLEEN M. LEAHY

Symposium on Medicolegal Problems. *Under the Co-Sponsorship of the Institute of Medicine of Chicago, the Chicago Bar Association, and the Chicago Medical Society—Edited by Samuel A. Levinson. Series Two. Philadelphia: Lippincott,* 1949. 276 pp. Price, $5.00.

This is the second of the able and interesting reports of the joint meetings of physicians and attorneys in Chicago. The first, concerned with medical witnesses, artificial insemination, pathology, sterility operations, trauma, and cancer, and scientific tests as evidence, was reviewed in the June, 1948, issue of this *Journal.* The current series is somewhat broader and more thorough than the first. It begins with a most comprehensive and rather technical discussion by W. M. Krogman, Ph.D., of the human skeleton in legal medicine, with legal comments by A. R. Peterson, Esq. For those interested in deter-

mining with reasonable accuracy the age, sex, race, and height of a deceased human body from a few available bones or fragments of bones, invaluable assistance will be found in this section, which is said to be the first integrated presentation of this material.

Other subjects include psychiatry and the civil law, the medical aspects of which are capably presented by F. J. Gerty, M.D., and the legal by Judge H. M. Fisher; psychiatry and the criminal law, discussed from the medical viewpoint by P. L. Schroeder, M.D., and from the legal by W. F. Crowley, first assistant State's attorney; federal control of drugs and cosmetics, by Morris Fishbein, M.D., and A. M. Loverud, Esq., principal attorney, Food and Drug Division, Federal Security Agency; and radiation hazards and health protection in radioactive research, including the atom bomb and its products, by A. M. Brues, M.D., who was associated with the Manhattan District, and A. J. Bowe, Esq. It is interesting and distinctly startling to note that the radioactive effects of just one of the bombs used at Bikini is equivalent to that of several thousand tons of radium, whereas the average radiologist has carefully locked up in his safe in a platinum or lead container not more than 25 to 50 milligrams of radium, or perhaps one one-thousandth of an ounce.

Each of the sets of papers is followed by a question and answer period, and Dr. Levinson contributes a summary of the facts presented in this well printed book. It should be of great interest and value to all who are concerned with these timely problems.

JAMES A. TOBEY

Perspective in Medicine. *Six Lectures to the Laity on Frontiers of Medical Research. The March of Medicine, 1948. New York: Columbia University Press,* 1949. 163 pp. Price, $2.50.

This volume represents the 13th annual series of the Laity Lectures of the New York Academy of Medicine presented during the year 1947–1948. Six lectures fit well under the topic "Perspectives in Medicine" as follows: The Atom in Civil Life by Lewis L. Strauss of the U. S. Atomic Energy Commission; Food and Civilization by Sir Raphael Cilento, M.D., Director of the Social Division of the United Nations; On Being Old Too Young by Edward J. Stieglitz, M.D., of the Suburban Hospital, Washington, D. C.; Perspectives in Cancer Research by Cornelius P. Rhoads, M.D., Director of the Memorial Hospital, New York; Psychiatry for Everyday Needs by William C. Menninger, M.D., of Topeka, Kans., and The Inter-Relation of Pure and Applied Science in the Field of Medicine by James B. Conant, Ph.D., President of Harvard University.

On the whole, these lectures represent a very good adjustment of the story in these technical fields to the vocabulary of the intelligent reader. The Academy is to be congratulated on this edition of the series.

REGINALD M. ATWATER

BOOKS RECEIVED

Listing in this column acknowledges the receipt of books and our appreciation to the senders. Space and the interests of readers will permit review of some, but not all, of the books listed.

AMERICAN FOUNDATIONS AND THEIR FIELDS VI. Edited by Wilmer Shields Rich and Neva R. Deardorff. New York: Raymond Rich Associates, 1948. 265 pp. Price, $6.00.

AMERICAN YEAR BOOK 1948. Edited by William M. Schuyler. New York: Thomas Nelson, 1949. 814 pp. Price, $15.00.

A BABY IS BORN. Milton I. Levine and Jean H. Seligmann. New York: Simon & Schuster, 1949. 54 pp. Price, $1.50.

CLASSIFIED BIBLIOGRAPHY ON GERIATRICS AND THE CARE OF THE AGED. John J. Griffin. Somerville, Mass.: Bureau of Old Age Assistance, 1948. 80 pp. Price, $2.10 postpaid, $1.85 prepaid.

CONFERENCE ON METABOLIC ASPECTS OF CONVALESCENCE. Transactions of the 17th Meeting March 29–30, 1948. New York: Josiah Macy Jr. Foundation. 246 pp. Price, $4.00. Transactions of the 16th Meeting, October 27–28, 1947. 108 pp. Price, $3.00.

COMMON SENSE ABOUT FUND RAISING. Robert Keith Leavitt. New York: American Book, 1949. 76 pp. Price, $2.00.

DIAGNOSTIC TESTS FOR INFANTS AND CHILDREN. H. Behrendt. New York: Interscience, 1949. 491 pp. Price, $7.50.

DISCIPLINE. James L. Hymes, Jr. New York: Teachers College, Columbia University, 1949. Price, $.60.

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

Guidance and Understanding—This is an exciting era in obstetrics adorned with the new phrases like, "childbirth without fear," "painless childbirth," "natural childbirth," "relaxation exercises," "rooming in," "self-demand feeding," and "early ambulation." So begins a story of a clinic in which a real educational job is done.

BOYLE, F. Public Health Nurse in an Obstetrical Clinic. *Pub. Health Nursing* 41, 5: 253 (May), 1949.

Letter from Great Britain—At the first London County health center, now authorized, medical and dental practitioners, and local health staffs will be housed together for a more effective collaboration between curative and preventive medicine.

BROCKINGHAM, F. The General Practitioner in Great Britain in 1949. *Canad. J. Pub. Health* 40, 4:171 (Apr.), 1949.

Here To Stay: They Say—Canadian children under 16 receive a government allowance of $5 to $8 a month. No strings attached! In the United States this would mean a 3¼ billion appropriation. Are you interested?

CLOSE, K. Dominion Pay for Every Child. *Survey* 85, 5:245 (May), 1949.

Rats and Repairs—Is this something you, too, haven't thought much about? An estimate of the number of rats in a city is clearly necessary for an evaluation of the problem and the effect of repressive measures. That introduction set me off in pursuit of the novel assumption, and I hope it will do the same for you.

DAVIS, D. E., AND FALES, W. T. The Distribution of Rats in Baltimore, Maryland. *Am. J. Hyg.* 49, 3:247 (May), 1949.

Ten Years Later—After a riotous start marred by ugly legal and extra-legal shenanigans, the Group Health Association of Washington has become a respectable, prepaid medical service, its staff accorded hospital privileges, and accepted in medical societies. Incidentally, the scheme is increasingly successful.

ETKIN, S. A Decade's Experience in the Operation of a Group Medical-Care Organization. *New England J. Med.* 240, 18:703 (May 5), 1949.

About Ready Cures for Social Ills—When we speak as professionals about matters beyond our knowledge and training, we weaken our authority to speak and to act in matters within our professional range. This gem is culled from a warning to the dilettante mental hygienists among us plodding health workers—a warning covering a lot of ground, incidentally.

GINSBURG, S. W. Social Science and Social Action: Implications for Mental Hygiene. *Ment. Hyg.* 33, 2:236 (Apr.), 1949.

More Recruits—In this study, every third patient who registered at the prenatal clinic was conditioned for childbirth without anesthetics. Provided the proper services are available the scheme is physically safe and psychologically desirable, conclude the researchers.

GOODRICH, F. W., JR., AND THOMS, H. A Commentary on Natural Childbirth. *Pediatrics* 3, 5:613 (May), 1949.

Not Like Rubella—During the 1947 mass vaccination in New York, 4,172 women received vaccine while in the first trimester of pregnancy. There was no evidence of any deleterious effect upon the developing embryo.

GREENBERG, M., *et al.* The Effect of Smallpox Vaccination During Pregnancy on the Incidence of Congenital Malformations. *Pediatrics* 3, 4:456 (Apr.), 1949.

This I Didn't Read—I imagine this panel discussion on rheumatic fever must be highly useful for all health workers concerned with the care of patients with that disease. Others, more conscientious, will jeopardize their priceless eyesight by wading through 30 solid pages of over-long lines set in 8 point type.

HILL, L. F., *et al.* Rheumatic Fever: Summary of Present Concepts. *Pediatrics* 3, 5: 680 (May), 1949.

Professional Tempus Fugit-s, Too—When there isn't enough to go round, it is doubly important to be sure one child isn't getting more than his share. This time study of a health department showed that school health was eating up most of the nurse's time and that V.D. and infant health were starving.

MALCOLM, J. C., *et al.* Time Analysis of Public Health Nursing Service. *Pub. Health Rep.* 64, 17:523 (Apr.), 1949.

Pediatricians Needed—To summarize a summary, says one of the writers, approaches a *reductio ad absurdum*. Nevertheless, he squeezes a few drops of juice from the already compressed fruits of the now celebrated pediatric survey. It will help you to read this thumbnail reminder of what's wrong with our child health services.

SISSON, W. R., AND HUBBARD, J. P. Child Health Services and Pediatric Education. *Pediatrics* 3, 4:401 (Apr.), 1949.

Cautions Against Caretaking—Here is a little sample, "Officially in Great Britain you are old at sixty if you are a woman. Why, I don't know: but that is a fact—a legal fact. And you are old at sixty-five if you are a man." Don't you think you had better hunt out this paper? There is a lot more in it than just readable writing.

SHELDON, J. H. Old-Age Problems in the Family. *Milbank Mem. Fund Quart.* 27, 2: 119 (Apr.), 1949.

Coördination More Vital Than Centralization—Statistical activities of the 48 state health departments follow 5 basic patterns. (I'd have thought there would be nearer 48 patterns.) Most have no central statistical organization, each division keeping its own records catch-as-catch-can.

SWINNEY, D. D. Current Organizational Patterns of Statistical Activities in State Health Departments. *Pub. Health Rep.* 64, 20:621 (May 20), 1949.

Let the Nurses Do It!—Ways have been worked out to teach nurses, while on the job, to deal with family mental health problems, as part of the daily program of a small health department. This you should know about.

ZIMMERMAN, K. A. The Importance of the Family in the Prevention of Mental Illness. *Milbank Mem. Fund Quart.* 27, 2:133 (Apr.), 1949.

Motion Picture Film Reviews

HOMER N. CALVER, *Film Review Editor*

The Story of Wendy Hill—Diabetes. Color. Sound. 18 min. 16mm. and 35mm. Warner News, Inc., for U. S. Public Health Service and American Diabetes Association. State Health Departments for 16mm.; 35mm. from Chief, Public Health Inquiries Branch, Division of Public Health Methods, U. S. Public Health Service, Washington 25, D. C.

From the medical viewpoint, "The Story of Wendy Hill" presents an accurate story of the discovery of the presence of diabetes mellitus in a young adult and its subsequent care and management. Unfortunately, throughout the first half of the film there is too much background story with too much time being taken to get to the point of the film.

Of course, it is perfectly plausible for diabetes to be discovered upon a routine examination while the patient is in the hospital for some other reason. However, this is certainly not the typical way, and the good doctor's philosophy that being run down by a truck might be considered a good thing is hardly acceptable. It would have been much better to have the patient go through the early symptoms of diabetes, which would lead up to a medical examination with discovery of the disease. The film could then expound upon the virtue of the periodic health examination so that the disease could have been discovered before the symptoms had progressed very far.

The clinical portrayal of the complications of diabetes when left untreated are too sketchy and fail to round out the whole story of the diabetic syndrome.

This film has good educational qualities in that it makes clear that diabetes is a disease to which one can adjust oneself with adequate care. It should be helpful to diabetics in this way, but it has missed a splendid opportunity to emphasize the importance of periodic medical examinations.

It is a very excellent film technically, about the only criticism possible from this angle being that the color is not as brilliant and uniform as we have come to expect in professionally made pictures. This film should be very useful to discussion groups in connection with the proposed educational program of the American Diabetes Association next fall. In such discussions the points of omission can easily be covered.

I. JAY BRIGHTMAN, M.D.
HELEN CROSBY
THOMAS C. STOWELL

Journey into Medicine—Personnel recruitment for public health work. Black and white. Sound. 40 minutes. 16mm. Produced for Department of State. Available for short-term loan from Regional Offices of the U. S. Public Health Service; for purchase from Castle Films, 30 Rockefeller Plaza, New York 20, N. Y. $46.84, less 10% discount to nonprofit organizations.

This documentary film was produced by the U. S. Information Service for showings outside the U.S.A. to give non-Americans an insight into American ways in medicine and public health. It carries a young man through his medical course and his internship in pediatrics, which results in his desire to study public health. There are excellent scenes of good medical teaching against a background of some of America's best teaching institutions (Columbia, Cornell, and Johns Hopkins). The practical side of

the training is organized around an outbreak of diphtheria in Baltimore. The medical and public health content is accurate and well presented. The public service is portrayed in a dignified and attractive manner, and the service motive is well set forth.

The use of this film for recruiting purposes in the United States is limited somewhat by the original objectives of the State Department in its production and distribution.

It would be particularly effective for third and fourth year medical students who are at the period when they are seeking to decide in which field of medicine they can be of maximum service and derive the greatest personal satisfactions.

One wishes that there had been a little less of medical training and a broader treatment of the total activities of the health department.

The type casting is excellently done and some minor roles are played by well known health authorities. Unusually good camera work heightens its intent. Well directed and for its original purpose, well edited. For public health recruitment purposes it would be improved by cutting.

REGINALD M. ATWATER, M.D.

Fellowships for Latin-American Physicians

The American College of Physicians and the W. K. Kellogg Foundation, with the coöperation of the U. S. Department of State and of medical schools in the U. S. A., Canada, and Latin-American countries, announce a program of postgraduate medical fellowships. Outstanding young physicians will be nominated by local committees in the countries to the south. Those to whom fellowships are awarded will be brought to this country for a year or more of special training.

Eligibility requirements include citizenship in the country from which application is made and familiarity with its culture and economy, graduation from an acceptable medical school, and completion thereafter of an internship of 12 months or more, ability to use the English language, and assurance of a subsequent teaching affiliation with a medical school in the native country. Those needing some training in English will be assigned to a special course for the purpose in the United States.

The American College of Physicians, operating through its Committee of Fellowships and Awards, will undertake to arrange a suitable program of study in internal medicine or its subspecialties, such as cardiology, gastroenterology, etc., in widely recognized medical educational centers in this country, and to place the fellows appropriately under preceptors in these institutions.

The W. K. Kellogg Foundation will provide each fellow with a monthly stipend adequate for his basic living costs, an allowance for necessary travel within this country or Canada, and will defray the tuition for courses recommended by the preceptor and approved by the sponsors. In view of the pressing need of Latin-American medical libraries, the Foundation will reimburse the fellow for the cost of required textbooks on condition that they become the property of the medical school in which the fellow will teach upon his return home.

Representatives of the Foundation will visit the fellows periodically during their stay in this country for conferences with them and their preceptors, thus to follow their progress. They will also be visited at intervals after their return to their home institutions in an effort to evaluate the end results of their training and to offer any possible assistance to improve teaching, research, and practice in the field of internal medicine in their respective countries.

Opportunities Wanted

Health Educator; Master's degree, Public Health, Eastern university; four years, health educator, county health department; three years, health coordinator, liberal arts college; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago.

Health Educator; B.S. (Public Health Nursing); M.S. (Health Education); prefers teaching Health Education in schools or colleges; at present assistant professor university school of public health; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public Health Dentist; graduate training, public health dentistry, Michigan; several years' successful general practice before specializing; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public Health Nurse Administrator; B.S. (Education); M.P.H.; four years, consultant in public health and school nursing, metropolitan health department; past several years, director, health education program, county health department; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public Health Physician; M.D., M.P.H., eastern universities; five years, chief health officer, department of ninety personnel including nine full-time public health physicians; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Sanitary Chemist; M.S. (Sanitary Chemistry); four years, water chemist, county health department; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

NEWS FROM THE FIELD

SUMMARIZING THE PENNSYLVANIA STUDY

The report of the study of Pennsylvania's health services, made under the supervision of Roscoe P. Kandle, M. D., field director of the A.P.H.A., was completed and presented to Governor Duff and Secretary of Health Vaux in February, 1949, in an edition of 1,500 copies, about 1,000 of which were distributed in Pennsylvania and the remainder to a wider public. This was one of the series of state studies which have been subsidized by the Commonwealth Fund of New York during the past 10 years.

Perhaps the initial impetus for the study was given by the Medical Society of Pennsylvania through its Commission on Public Health and Preventive Medicine. Its chairman is Pascal F. Luchesi, M. D., Superintendent and Medical Director of the Philadelphia General Hospital. With the accession to office both of Governor James H. Duff and State Health Secretary, Norris W. Vaux, M. D., and their interest in "a thoroughgoing evaluation of the Commonwealth's public health administration," they jointly requested the A.P.H.A. to make the study. In carrying out the study not only did experts in the various fields of public health serve as consultants, but workshops and other meetings with groups of Pennsylvania citizens formed an integral part of the evaluation. Thus the citizens themselves had a hand in shaping conclusions and recommendations.

Citizen interest in the study and its findings was also made evident in a series of meetings in various parts of the state. These were called by tuberculosis associations, councils of social agencies, community nursing services, and others to discuss problems relevant to the study. Even before the final report was presented to the Governor there was thus created public interest and discussion.

Now a digest of the report has been published in the February, 1949, Commonwealth: *The Magazine for Pennsylvania*. It was prepared by the staff of the magazine. This is a bimonthly magazine prepared for distribution among the state's citizens with an interest in state and municipal affairs. Over 10,000 copies of this number are being distributed to local health administrators and others with a particular interest in community health services.

In the digest the authors have "followed the text of the Survey very closely, with no editorial elaboration." It summarizes the "seven objectives for a new era in Pennsylvania public health" as follows:

1. Increase the efficiency of public health forces.
2. Complete the task of reporting and controlling tuberculosis.
3. Continue to push the eradication of the more common major communicable diseases.
4. Bring all resources of science to bear against rheumatic fever.
5. Reduce materially the ravages of cancer.
6. Attack and vigorously apply active preventive measures to the serious, ever present, and currently increasing problem of mental illness.
7. Insure the continued maximum application of preventive measures to safeguard the health of mothers and children, of industrial workers, and of the older citizens of the Commonwealth.

The digest further summarizes the eight basic recommendations of the Survey as "eight keystones for building Pennsylvania's public health program." These recommendations are:

1. The establishment in the Department of Health of a unit of county or district pub-

lic health administration under a deputy secretary of health.

2. Develop minimum standards of performance for all phases of public health, and apply these standards to the service provided by the state and to the public health activities of each municipality. The insistence by the citizens of the Commonwealth that these standards be met and their acceptance by all health agencies will be necessary for maximum benefits.
3. Decentralize the Department of Health services by establishing district offices, with full-time, qualified district medical directors to administer all direct state services. Every local health worker, both official and voluntary, and all citizen groups should insist on the speedy development of this plan to bring public health services nearer to the people, and to set the stage for local health units. The background of this recommendation is that Pennsylvania's public health law, unique among the 48 states, provides for the direct operation by the State Health Department of local health services in what may roughly be defined as rural areas. Thus the state operates some local health services in each of the 67 counties of the state except Philadelphia and for more than one-fourth of the state's population and more than one-third of the population outside of Philadelphia.
4. Apply a merit system to all public health personnel which will include the best modern practices in recruitment, methods of selection, permanence of employment, equality and adequacy of pay, impartial treatment, and provision for economic security upon retirement. The report found that 90 per cent of health department employees are officially selected under the patronage system with the other 10 per cent in effect so selected although required to be approved by the Civil Service Commission.
5. Extend further professional training opportunities to all the public health workers of the state.
6. Establish public health units in counties, cities, or other municipalities or in combinations thereof, with the state providing supervision necessary to assure the maintenance of acceptable standards of performance.
7. Simplify, revise, and codify if necessary the laws relating to public health.
8. Reorganize the structure of the Department of Health to achieve a clear, direct line of service from the Governor, through the department to the people.

INTERNATIONAL MEETING FOR RABIES CONTROL

An international round table to discuss rabies control along the United States-Mexico Border was held in Nogales, Ariz., on April 26, 1949, under the auspices of the Pan American Sanitary Bureau and with the help of Dr. James H. Steele, D.V.M., Senior Veterinarian of the Atlanta Communicable Disease Center, in organizing the meeting. Dr. Fred L. Soper, Director of the Bureau, called the meeting to order. The following representatives were present:

Dr. Gustavo Argil, Undersecretary, Public Health and Social Welfare, Mexico

Dr. Martin D. Baum, Director, Veterinary Public Health Program, Colorado Department of Health

Dr. James Doughty, New Mexico Health Department

Dr. Jose Figueroa, Director General, Animal Husbandry, Mexico

Oscar Flores, Undersecretary, Animal Husbandry, Mexico

Dr. James H. Steele, U. S. Public Health Service

Dr. Oscar Sussman, Senior Veterinarian, New Jersey Health Department

Dr. Gerardo Varela, Director, Institute of Public Health and Tropical Diseases, Mexico

Dr. Kenneth S. Young, Director, Veterinary Public Health Program, Texas Health Department

ANNUAL MEETING OF SOUTHERN BRANCH

The Southern Branch of the A.P.H.A. held a spirited and successful meeting in Dallas April 14–16. About 400 participants came from 21 states, the District of Columbia, and Mexico. A session was sponsored by each of nine sections of the Southern Branch. In addition there were four general sessions including a banquet.

The Nutrition Section was organized at this meeting and had a full section program. The Biology Section reported the proceedings of its first annual meeting held in April, 1948.

Among the actions taken by the meeting were resolutions recommending pas-

sage of federal legislation insuring health services to every county in the nation, endorsing the research program of the National Institutes of Health, and endorsing the inscription of General William Crawford Gorgas's name in the New York University Hall of Fame. An amendment to the Constitution adding to the list of officers a delegate to A.P.H.A. was passed (*A.J.P.H.* 38:12: 1732 (Dec.), 1948).

The newly elected officers are:

President: George A. Denison, M.D., Health Officer, Jefferson County, Ala.
Vice-Presidents: James H. Stephens, Sanitary Engineer, South Carolina Department of Health
N. H. Dyer, M.D., West Virginia State Health Officer
J. V. Irons, M.D., Director of Laboratories, Texas State Board of Health
Secretary-Treasurer: Ben Freedman, M.D., Director, Public Health Training Center, Louisiana State Board of Health
Delegate to A.P.H.A.: John M. Whitney, M.D., Medical Director, Midwestern Area, American Red Cross

MASSACHUSETTS PUBLIC HEALTH ASSOCIATION

The spring meeting of the Massachusetts Public Health Association was held April 28 at the Massachusetts Institute of Technology in Cambridge, with section meetings devoted to newer developments in cancer control, a panel of health officers on local health department utilization of federal funds, nutrition services in the Boston area, and a panel on accident prevention as a community problem. The final general session was a panel on Community Planning in an Atomic Age led by Shields Warren, M.D., director of the division of biology and medicine, Atomic Energy Commission.

WATER- AND MILK-BORNE DISEASES

The Division of Sanitation, Milk and Food Branch, U. S. Public Health Service, has published another of its summaries of disease outbreaks from water, milk and milk products, and other foods. One summary gives a consolidation of information on reported cases of disease transmitted through milk for the years 1923–1947; another of disease transmitted through water, milk and milk products, and other foods for 1938–1947. As in the past, there has been appended a brief description of each disease outbreak reported in 1947 in which water, milk and milk products, or other foods served as the responsible vehicle.

1949 I.E.S. GOLD MEDAL AWARD

Dr. Ward Harrison, retired Director of the Engineering Division of General Electric Lamp Department, has been awarded the 1949 I.E.S. Gold Medal by the Illuminating Engineering Society. The I.E.S. Medal is the Society's top distinction and is awarded each year "for meritorious achievement conspicuously furthering the profession, art, and knowledge of illuminating engineering." Dr. Harrison has consulted on several occasions with the Joint A.P.H.A.-I.E.S. Committee studying the need of research in illumination.

END OF TUBERCULOSIS IN 1965

The New York State Committee on Tuberculosis and Public Health at its annual conference in May set as its goal the "rooting out" of tuberculosis in the state by 1965. To this end it voted a program of continued coöperation with all governmental agencies and allied groups, with special emphasis on public education, early discovery through chest x-rays, adequate hospital facilities, and rehabilitation service.

HELP IN PLANNING CONTINUOUS SAFETY CAMPAIGNS

The *Home Safety News Letter* was launched in May as a bimonthly by the Home Safety Conference of the National Safety Council. It is designed to serve as a continuous planning guide

for home safety committees and organizations participating in community home safety programs. Instead of one home safety week it suggests every week as a home safety week. The first issue has detailed suggestions for vacation safety, farm safety, canning safety, and for the look ahead toward building safety, play safety, etc.

Available from National Safety Council, 20 N. Wacker Drive, Chicago 6, $1 or a combination of Home Safety Kit, *Home Safety Review*, and the *Newsletter*, $2.

LOCAL HEALTH SERVICES DIRECTORS MEET

At the 3rd annual meeting of the Association of State and Territorial Directors of Local Health Services in Memphis in April, V. A. Van Volkenburgh. M.D., of New York, was elected President. Other new officers are:

1st Vice President: John Williams, M.D., Missouri
2nd Vice President: J. K. Altland, M.D., Michigan
Secretary: Trois Johnson, M.D., Louisiana
Member, Executive Committee: Paul Q. Peterson, M.D., Ohio

Robert E. Rothermel, M.D., Assistant Field Director, and Charles B. Frasher, Field Consultant of the A.P.H.A. Staff were on the program, as were Carl Buck, former field director, and Joseph W. Mountin, Harald M. Graning, M.D., and Donald Simpson of the Public Health Service.

The 1950 meeting of the local health service directors has been scheduled for March in New Orleans.

CHARLOTTE FLUORINATES WATER SUPPLY

On April 1, Charlotte, N. C., became another city in the United States and Canada where domestic water supplies are being fluorinated for expected dental health benefits. The Charlotte Fluorination Demonstration is a fact finding project under the direction of the Charlotte Health Department and paid for by special appropriation of the City Council. Pre-fluorination studies were made with maximum participation of citizen and professional groups. Citizen queries as to taste, effect on goldfish, and photographic solutions antedated the actual introduction of fluoride.

INDIANA CODIFIES ITS HEALTH LAWS

The 1949 session of the Indiana General Assembly passed and the Governor has signed the codification bill of the Indiana State Board of Health. This consolidates the more than 100 Acts dealing with public health, the first of which was passed in 1881, into one Act which has eliminated the confusion, ambiguity, overlapping, and duplication that existed among the separate provisions. It does not make any material change in the substantive law. The laws have been collected into five major groupings—administration, disease prevention and control, vital statistics, sanitation, food, drugs and cosmetics—and a miscellaneous category. L. E. Burney, M.D., is the state health officer under whose general direction this codification was made. The address of the State Board is 1098 W. Michigan St., Indianapolis 7.

CONNECTICUT EXPANDS MENTAL HEALTH PROGRAM

An advisory committee of nine leaders in the fields of psychiatry, health, juvenile problems, social work, and education to plan expansion of Connecticut's mental health program has been appointed by Dr. Stanley H. Osborn, State Health Commissioner; funds will be available under the provisions of the National Mental Health Act. Dr. Elias J. Marsh, Jr., acting director of the State Department of Health's Bureau of Mental Hygiene, will direct the expanded program.

HONOR TWO FLORIDA HEALTH WORKERS

Two staff members of the Florida State Board of Health have been honored for outstanding work in their fields. Roger F. Sondag, M.D., Director, Bureau of Preventable Diseases, was awarded a bronze medal by the American Cancer Society "for distinguished service in cancer control." The Florida Engineering Society selected David B. Lee, M.S., Chief Sanitary Engineer of the board, for exceptional service to the engineering profession of Florida.

GORGAS AWARD TO DR. DEAN

The Association of Military Surgeons of the United States has named H. Trendley Dean, D.D.S., to receive the 1949 Gorgas Award for "outstanding contributions in the field of military medicine." Dr. Dean, who last September was named director of the National Institute of Dental Research, has been with the Public Health Service since 1921, in charge of dental research since 1931. His work on fluoride treatments "may lead to the mass prevention of dental decay."

The award, which is sponsored by the Philadelphia pharmaceutical manufacturers, Wyeth, Inc., will be presented at the annual meeting in Washington on November 11, of the Association of Military Surgeons.

KANSAS PUBLIC HEALTH ASSOCIATION

The 7th annual meeting of the Kansas Public Health Association was held in Pittsburg, April 25–27. An interesting program was developed around the theme, "A Program for Public Health Services in Kansas." Speakers from out-of-the-state included:

John K. Altland, M.D., Bureau of Local Health Services, Michigan Department of Health
Donald A. Dukelow, M.D., Bureau of Health Education, American Medical Association
John E. Gordon, M.D., Professor of Epidemiology, Harvard School of Public Health
Elberton J. Tiffany, M.D., Atlanta Communicable Disease Center
Maysil M. Williams, M.D., Regional Medical Director, U. S. Children's Bureau
Gertrude Morris, R.N., Territorial Nursing Supervisor, Metropolitan Life Insurance Company

The Association voted to meet jointly with the Missouri Public Health Association in Kansas City, Mo., in 1950.

New officers were elected as follows:

President: James M. Mott, M.D., Director, Lawrence-Douglas County Health Department
President-elect: Vernon M. Winkle, M.D., Director, Kansas City-Wyandotte County Health Department
Vice-President: Roberta Foote, R.N., Director Public Health Nursing Education, State Health Department
Secretary-Treasurer: Evelyn Ford, Records Consultant, State Health Department

MISSOURI PUBLIC HEALTH ASSOCIATION

The 1949 Annual Meeting of the Missouri Public Health Association was held in Jefferson City, May 4 to 6, and at this time the following officers were elected:

President: J. Earl Smith, M.D., St. Louis
President-elect: Ina Collins, R.N., Poplar Bluff
First Vice-President: Cecil A. Z. Sharp, M.D., St. Louis
Second Vice-President: Jeanette Burchard, Springfield
Treasurer: John Buxell, St. Louis
Secretary: Albert W. Happy, Jr., Jefferson City
Representative to A.P.H.A. Governing Council: Joseph C. Willett, D.V.M., St. Louis
Representative to Southern Branch, A.P.H.A.: John W. Williams, Jr., M.D., Jefferson City

The 1950 Annual Meeting will be held jointly with the Kansas Public Health Association on April 24, 25, and 26 in Kansas City, Mo.

ARIZONA PUBLIC HEALTH ASSOCIATION

The 19th Annual Meeting of the Arizona Public Health Association was held in Prescott, May 12 and 13, with some 140 members attending. Using the

workshop plan of conducting the sessions, the convention was enthusiastically dubbed by the members as one of the most successful in the history of the organization.

Dr. Robert E. Rothermel, Assistant Field Director, A.P.H.A., addressed the final general session, and Senator Sam Head, the banquet session.

Newly elected officers of the association are:

President: Marion Sprague
President-elect: C. E. Reddick, M.D.
Vice President: Margaret Eacrett
Secretary: Dorris Rakop
Treasurer: Mary Peterson

ILLINOIS PUBLIC HEALTH ASSOCIATION

At its ninth annual meeting held in Chicago April 7 and 8, the Illinois Public Health Association elected the following officers:

President: B. K. Richardson, Springfield
President Elect: Winston H. Tucker, M.D., Evanston
Secretary-Treasurer: Dorothy Fay Dunn, M.S.P.H., Champaign

OHIO ENRICHES FLOUR

A bill has been passed by the Ohio Legislature and signed by the Governor providing for the enrichment of white flour. It became effective on July 1.

NUTRITION BUREAU IN NEW YORK'S HEALTH DEPARTMENT

The New York City Health Department has created a new bureau of nutrition in its division of community health services, one of the five main divisions into which the department's services were reorganized by Health Commissioner Harry S. Mustard, M.D. During the coming year five nutrition clinics will be added in various sections of the city to the single one now in existence. Present educational activities in the publication of nutrition and diet advice will be expanded, as will the department's research studies on nutritional deficiencies and needs of children in different communities. Inservice training courses will be conducted for health deparent personnel on various phases of nutrition as they affect the work of other bureaus.

The director of the new bureau is Norman Jolliffe, M.D., who has completed the editing of a volume on clinical nutrition, slated for spring publication. He is a member of the Food and Nutrition Board, National Research Council, and Chairman of the New York City Food and Nutrition Committee.

PERSONALS

RUTH ACKLAND,† Assistant Chief of Health Education, Hawaii Territorial Department of Health, became Assistant Executive Secretary in charge of health education with the Territorial Tuberculosis Association on June 1.

CALVIN C. APPLEWHITE, M.D.,† Medical Director, Public Health Service of Federal Security Region 6 with headquarters in New Orleans, went on terminal leave on May 17 until his retirement from the Service on October 1, 1949. JOHN B. HOZIER, M.D.,† succeeds him as Acting Medical Director for Region 6.

GEORGE PACKER BERRY, M.D.,* formerly Professor of Bacteriology and Associate Dean of the School of Medicine and Dentistry at the University of Rochester, N. Y., has been appointed Dean of the Harvard Medical School and Professor of Bacteriology, as of July 1, to assume his duties in the fall. He succeeds SIDNEY BURWELL, M.D., who has resigned as Dean to devote his full time to teaching and research. Dr. Berry is Associate Editor of the *Journal of Immunology* and of *Bacteriological Reviews*, and a member of the editorial board of the *Journal of Bacteriology*.

FREDERICK J. BRADY, M.D., Assistant Chief, Laboratory of Tropical Diseases, National Institutes of Health,

represented the Public Health Service at the first meeting of the International Scientific Committee for Trypanosomiasis Research in London in February.

A. JUNE BRICKER, was named on April 4, as Director of the Home Economics Bureau of the Health and Welfare Division, Metropolitan Life Insurance Co., to succeed ELIZABETH GUILFORD, retired.

DEAN MARGARET BRIDGMAN, on leave from Skidmore College has been appointed for a 2 year period by the Russell Sage Foundation as a special consultant to universities in the field of nursing education to give advisory service on what constitutes sound professional preparation for nursing, how programs may be financed, the procurement of faculty, and the like.

MAX R. BURNELL, M.D., Medical Director of the AC Spark Plug Division of General Motors since 1931, has been appointed Medical Consultant effective July 1, succeeding CLARENCE D. SELBY, M.D.,* who retired on his 71st birthday after 14 years' service as General Motors Medical Consultant.

JEAN CRAWFORD, formerly with the New York State Department of Civil Service, joined the staff of the National Tuberculosis Association on May 1, to assume major responsibility in assisting the field on salary, classification, and general personnel problems.

CHARLOTTE CROCKETT and DORIS JOHNSON, formerly health education and rehabilitation director, respectively, of the Middlesex, Mass., Health Association, joined the staff of the Massachusetts Tuberculosis and Health League last February.

BARBARA DAVIS, is Executive Secretary of the Kauai (Hawaii) Tuberculosis Association, succeeding MABEL WILCOX,† who continues as a member of the Association's Board of Directors.

H. TRENDLEY DEAN, D.D.S.,* Director of the National Institute of Dental Research, Washington, D.C., has been awarded the 1949 Gorgas Award "for outstanding contributions in the field of military medicine."

EARL DEVENDORF,* Director of Environmental Sanitation, New York State Department of Health, Albany, has been appointed Acting Executive Secretary of the new Pollution Control Board of New York State, of which HERMAN E. HILLEBOE, M.D., M.P.H.,* is Chairman.

THOMAS A. DEVENY, JR., formerly probation officer with the Kanawah County Intermediate Court, W. Va., became Executive Secretary of the West Virginia Tuberculosis and Health Association on June 1, succeeding EDMUND P. WELLS,† who resigned to accept a similar position in Maine.

EDWARD P. EGLEE, M.D., was recently elected Chairman of the executive committee of the New York Tuberculosis and Health Association, Inc., succeeding DONALD B. ARMSTRONG, M.D.,* now President.

MARGARET MCIVER ERVIN,† a former Red Cross worker, is health education secretary of the South Carolina Tuberculosis Association.

FLORIDA PUBLIC HEALTH NEWS NOTES

WILLIAM J. PEEPLES, M.D.,† formerly Director of the Troup County Health Department, Ga., has become Director of the Monroe County Health Department with headquarters at Key West. He succeeds JAMES B. PARRAMORE, M.D.,† resigned because of illness.

J. C. MCGUIRE, M.D.,† formerly Director of the Copiah County (Mississippi) Health Department, is now Director of Hardee, DeSoto,

* Fellow A.P.H.A.
† Member A.P.H.A.

and Charlotte Counties Health Unit with headquarters at Arcadia.

PAUL W. HUGHES, M.D.,† has moved from Assistant Health Officer in Alachua County, to Health Officer of Broward County with headquarters at Fort Lauderdale.

L. MAX GARDNER, former Chief of Special Services for the Illinois Division of Vocational Rehabilitation, is now Field Secretary, Illinois Tuberculosis Association.

WRAY GARDNER, M.D., began his duties as Director of the Mental Health Section, Colorado State Health Department, on May 1, and on the faculty of the University of Colorado Medical Center.

FRANZ GOLDMANN, M.D.,* Associate Professor of Medical Care, Harvard School of Public Health, is on leave of absence until December, 1949, to serve as consultant to the Public Health Branch of the Civil Administration Division, Office of Military Government for Germany, under a project sponsored jointly by the Rockefeller Foundation and the American authority.

ANNIE W. GOODRICH, dean emeritus of the Yale University School of Nursing, at the recent Convention in Cleveland of the National League of Nursing Education, received a Mary Adelaide Nutting Nursing Award.

DORITHA GRAHAM, formerly Field Secretary for the Missouri Tuberculosis Association, has joined the staff of the Nebraska Tuberculosis Association.

PAUL D. HANEY,* formerly Associate Professor of Sanitary Engineering, University of North Carolina School of Public Health, has been commissioned by the U. S. Public Health Service and assigned to the Stream Sanitation Section, Water Sanitation Investigation Station, Cincinnati, Ohio.

EMMA HARLING, has returned to Colorado as Mental Hygiene Nursing Consultant in the Public Health Nursing Section, after completing an 18 month course leading to the Master of Arts degree at Columbia University.

WALTER T. HARRISON, M.D.,* Public Health Service Medical Director of Federal Security Region 10 with headquarters in San Francisco, since 1942, retired from the Service July 1. HENRY C. SCHUMACHER, M.D.,* succeeds him as Acting Director of Region 10.

DAVID H. HOLBROOK, who retires on June 30 as Assistant Director of the National Social Welfare Assembly, New York City, received special recognition in the form of a special volume of tributes written by outstanding leaders in the field of welfare for his distinguished contribution to the health and welfare field over the past 38 years.

PAUL J. HOUSER† was appointed Director of the Division of Public Health Engineering, Iowa State Department of Health, Des Moines, on September 1, 1948.

JOHN F. MAHONEY, M.D.,* Director of the Public Health Service Venereal Disease Laboratory, Staten Island, N. Y., late in April went to Norway, Denmark, and Sweden to give a series of lectures on Venereal Disease Control. Given under the auspices of WHO, the lectures were requested by the directors general of public health of the respective countries.

MARGARET ANN MCCARTHY has become Associate in Health Education of Illinois Tuberculosis Association.

PEARL MCIVER, R.N.,* Chief, Public Health Nursing, Bureau of State Services and President of the American Nurses' Association, has recently been in Europe representing the U. S. Public Health Service at the Royal Sanitary Institute Congress meeting, May 23–27, in Brighton, England. She also attended the following meetings of the International Council of

Nurses in Stockholm, Sweden: Board of Directors, June 6–7; Grand Council, June 8–10; and Interim Conference June 12–16.

ROLAND B. MITCHELL, PH.D.,† has resigned as Director of Laboratories for the Florida State Board of Health to become Head of the Department of Bacteriology at the School of Aviation Medicine, Randolph Field, Tex.

ROY J. MORTON,* formerly in the Department of Preventive Medicine and Public Health, Vanderbilt University, is now in the Health Physics Division, Oak Ridge National Laboratory, Tenn.

ANNA G. MURPHY, recently retired as Executive Director of the Waterbury, Conn., Anti-Tuberculosis League, was honored by the league's board of directors at a luncheon marking her completion of 40 years as a tuberculosis nurse.

ROBERT J. NEVILLE, M.D., of Teaneck, N. J., joined the medical staff of the National Foundation for Infantile Paralysis on February 15. He is a staff member of New York Orthopaedic Dispensary and Hospital and of the Bergen Pines Hospital, N. J., which specializes in the treatment of acute and chronic poliomyelitis cases.

ARTHUR L. REAGH, Senior Bacteriologist of the Massachusetts State Department of Health, resigned on March 31, 1949, after 49 years with the department, in which he began the production of smallpox vaccine in 1904.

EDITH E. REIGER, has joined the Mesa County (Colorado) Health Department as public health nurse.

MARY M. ROBERTS, retiring editor-in-chief of the *American Journal of Nursing*, after 28 years of service, received a Mary Adelaide Nutting Nursing Award at the recent 53rd Convention in Cleveland of the National League of Nursing Education.

KENNETH C. ROSS,† formerly with the San Diego County (California) Tuberculosis and Health Association joined the staff of the National Tuberculosis Association on April 1 to be in charge of the Association's Training Program.

MARJORIE RUOSS is the new Garfield County, Colorado, public health nurse.

RALEIGH L. STRINGER, has been named President of the newly organized Fisher County (Texas) Tuberculosis Association; CHESTER U. CALLAN, M.D., Second Vice-President.

MARION F. TRICE,* Chief Industrial Hygiene Engineer, Tennessee Department of Public Health, is on a year's leave of absence to join the Institute of Inter-American Affairs as Director of the Department of Industrial Hygiene, Ministry of Health of Peru. He is stationed in Lima.

THEDA L. WATERMAN * resigned in January as Coordinator of Health Services, Tuberculosis Institute of Chicago and Cook County, to become Executive Director of the Central Agency for Chronically Ill of Milwaukee, Wis.

W. W. YUNG, M.D.,† formerly of the Ministry of Health, Nanking, China, has been appointed Director of the Epidemiological Intelligence Station in Singapore, operated by the World Health Organization, effective April 22.

ARTHUR R. ZINTEK, M.D.,† has taken over the active direction of the Tuberculosis Control Work of the Wisconsin State Board of Health. His predecessor, ALLAN FILEK, M.D.,* is now Director of Local Health Administration.

DEATHS

ALICE C. BAGLEY, R.N., (Public Health Nursing Section).

VICTOR F. CULLEN, M.D., former superintendent of the four Maryland State Tuberculosis Sanatoriums, died March 9, after a long illness.

FREDERICK B. DART, M.D., Health Officer, Town of East Lyme, Conn., died February 27 (Health Officers Section).

HARRY F. LEEDS,† District Health Officer, Pitman, N. J. (Health Officers Section).

ALAMIRO VALDES-HERRERA, M.D.,† Coquimbo, Chile, died May 6 (Public Health Education Section).

JOHN T. WRIGHT, M.D. (Senior Surgeon, Regular Corps), of the Laboratory of Biologics Control in the Microbiological Institute, National Institutes of Health, died May 14 of a heart attack, at the age of 37.

CONFERENCES AND DATES

American Congress of Physical Medicine. Netherland Plaza Hotel. Cincinnati, Ohio. September 6–10.

American Hospital Association. 51st Annual Convention. Hotel Statler, Cleveland, Ohio. September 26–29.

American Occupational Therapy Association. Book-Cadillac Hotel. Detroit, Mich. August 20–27.

American Public Health Association—77th Annual Meeting, New York, N. Y. October 24–28.

DIVERSEY
Planned Sanitation

helps you attain correct, year-around sanitation

gives plant operators a logical plan for assuring complete, easy, economical cleaning and disinfecting

provides training in correct sanitation procedures for plant clean-up crews

aids in the production of higher quality dairy products

Your inquiry is invited

Hit the Whole Target with

When attacking skin and wound infections, more than half of which "will be found to be due to a mixture of organisms",[1] the effective agent is one which, like streptomycin, has a wide antibacterial effect.

BRISTOL STREPTOMYCIN OINTMENT makes possible potent local action against most gram-negative and many common gram-positive organisms (such as Staphylococci and Streptococci). Its bacteria-destructive and bacteria-inhibitory effect is broader than other topical antibiotics. It is, therefore, effective against more skin and surface wound infections.

BRISTOL STREPTOMYCIN OINTMENT, demonstrably less sensitizing than other antibiotics used topically, may be employed with little fear of local reaction. Adverse systemic effects have not been seen following its use.

BRISTOL STREPTOMYCIN OINTMENT is indicated for the treatment of wound and skin infections due to organisms sensitive to streptomycin. Incorporated in a smooth water-soluble base, it is convenient and pleasant to use.

Bristol Streptomycin Ointment

Bristol
LABORATORIES INC
SYRACUSE, NEW YORK

(1) *F. L. Meleney. Surg., Gynec. & Obst. 86:760 (June), 1948*

Bristol Streptomycin Ointment, containing 5000 micrograms of streptomycin sulfate per gram, is available in 1 oz. tubes.

THE NINTH EDITION

of

STANDARD METHODS FOR THE EXAMINATION OF DAIRY PRODUCTS

This manual, prepared by the Committee on Examination of Milk and Milk Products, outlines procedures for the routine microbiological and chemical examinations of the more common dairy products used as food. It includes directions for enumerating, isolating, and identifying members of the coliform group, *Brucella,* streptococci, tubercle bacilli, *Salmonella,* pathogenic *Shigella,* and enterotoxigenic staphylococci.

The resazurin reduction method for the examination of fluid milk is included in this edition. Procedures are given for the examination of condensed milk, dried milk, evaporated milk and of fruits, nuts, flavoring and coloring materials, eggs and egg products, sweetening ingredients and stabilizers when used as ingredients in frozen desserts.

The primary aim in the new edition is to aid the laboratory worker by maintaining uniformity of arrangement and style, by using a system of simple cross references, and by improving the index. To do this, the first chapter on "Selection and Interpretation of Quality Tests" is organized for the guidance of the administrator. The succeeding twelve chapters, now relatively free from interpretive and explanatory matter, provide tried and tested methods for the laboratory worker. A group of "Screening Tests," which do not have approval for unqualified use, but which permit more frequent examinations than otherwise could be made, appear in the last chapter.

The thirteen chapter headings are listed below.

1. Selection and Interpretation of Quality Tests
2. Microbiological Methods for Milk and Cream
3. Detection of Special Bacterial Groups or Species
4. Microbiological Methods for Butter
5. Microbiological Methods for Cheese
6. Microbiological Methods for Frozen Dessert Ingredients
7. Microbiological Methods for Frozen Desserts
8. Sterility Tests for Dairy Equipment
9. Tests for Sediment and Extraneous Matter in Dairy Products
10. Determination of Vitamins
11. Phosphatase Methods to Determine Pasteurization
12. Chemical Methods
13. Screening Tests

373 pages, 37 illustrations Published 1948 Price, $4.00

CONSTANTS YOU CAN *Count On*

They're part of your necessary equipment... they're standard, dependable. No laboratory work can be carried on without them! In the field of nutrition you need a constant you can count on—an unchanging factor like Purina Laboratory Chow. It's a ration with a constant formula... the same food in the same form day after day, month after month—to make your experiments more valuable. Try Purina Laboratory Chow—a constantly uniform ration.

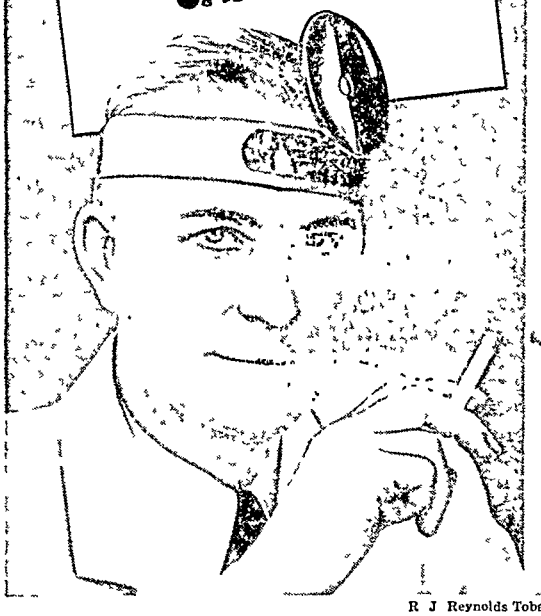
How mild can a cigarette be?

DOCTORS REPORT



In a recent test of hundreds of people who smoked only Camels for 30 days, noted throat specialists, making weekly examinations, reported

"NOT ONE SINGLE CASE OF THROAT IRRITATION DUE TO SMOKING CAMELS!"

SMOKERS REPORT

"I MADE MY OWN PERSONAL 30-DAY TEST! NOW I KNOW — CAMELS ARE THE MILDEST, BEST-TASTING CIGARETTE I EVER SMOKED!"

Sylvia MacNeill
SECRETARY

R. J. Reynolds Tobacco Company, Winston-Salem, N. C.

According to a Nationwide survey:

More Doctors smoke Camels

than any other cigarette

Doctors smoke for pleasure, too! And when three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel

And This Protein Era

"Today we are in the protein era."* This terse but meaningful statement, made by an outstanding authority in a recent review on the progress of nutrition, reflects an accomplishment of utmost significance.

This résumé of modern nutrition concepts shows convincingly that the recognition of the vital role of protein in health and disease ranks among the great advances of medicine.

The therapeutic use of a high protein dietary has revolutionized the prognostic outlook in many hepatic diseases formerly considered resistant to treatment.

The use of high protein dietaries has resulted in a gratifying reduction of surgical morbidity and mortality, made possible by systematic presurgical nutritional build-up of the patient. Through this same approach, wound healing and general recovery are greatly promoted.

In nephritis and nephrosis, at one time considered absolute contraindications for animal protein in the dietary, the use of protein in liberal amounts can significantly reduce mortality and decidedly improve the clinical condition.

The benefits derived from high-protein nutrition in pregnancy and lactation are diversified and far-reaching, embracing both mother and offspring. For this reason, a generous extra serving of meat, given daily as a routine measure, has been strongly recommended as a means of improving the health of mother and child.

Meat is rightfully regarded as an outstanding protein source. It is notably rich in protein. The protein of meat is biologically complete, capable of satisfying all protein needs of the body from childhood to old age. And, particularly important in disease, the excellent digestibility of meat gives virtual assurance that its protein and other valuable nutrients become available for utilization.

DIFCO

PEPTONES AND HYDROLYSATES

for Microbiological Culture Media

Difco peptones and hydrolysates are prepared to meet the diversified nutritional and biochemical requirements of microorganisms. A single peptone cannot provide the essential nitrogenous nutriments for all cultural and metabolic processes. Difco peptones and hydrolysates have been developed to meet the various requirements for microbiological procedures including growth, preparation of toxin and vaccines, and for the study of microbial metabolism.

BACTO-PEPTONE is most widely used in the preparation of routine culture media. It is rich in readily available forms of nitrogen, and in a one per cent solution it is sparklingly clear with a reaction of pH 7.0. Bacto-Peptone is specified in the formulae recommended in "Standard Methods of Water Analysis" of the American Public Health Association.

BACTO-TRYPTOSE is a peptone which was originally developed for cultivation of the *Brucella*. A two per cent solution, as the sole source of nitrogen, is an excellent substitute for the meat infusion generally employed for propagation of the *Streptococci, Pneumococci, Meningococci* and other discriminative bacteria.

PROTEOSE-PEPTONE is universally used in the preparation of media for elaboration of diphtheria toxin. It is also an excellent nutriment for use in media designed for the production of other bacterial toxins such as those of scarlet fever and botulinus.

PROTEOSE-PEPTONE NO. 3 is particularly suitable for use in culture media employed for isolation and propagation of *Neisseria gonorrhoeae* and *Corynebacterium diphtheriae*.

NEOPEPTONE is especially recommended as an ingredient of culture media for isolation and study of *Streptococci* and *Pneumococci*. Media prepared with Neopeptone are most satisfactory for cultivation of *Streptococci* in the smooth or mucoid phase. Growth of organisms from relatively small inocula is readily initiated in media containing this peptone.

BACTO-TRYPTONE is especially adapted for the elaboration of Indol and for use in media to detect Hydrogen Sulfide production. This peptone is recommended in "Standard Methods for the Examination of Dairy Products" of the American Public Health Association for the medium used in milk counts.

BACTO-CASITONE is a pancreatic digest of casein recommended for use in the preparation of media for sterility testing according to standard procedures, and for the preparation of media requiring an enzymatic hydrolyzed casein. Bacto-Casitone can be used for the detection of Indol production by microorganisms, since it has a high tryptophane content.

BACTO-CASAMINO ACIDS is an acid hydrolyzed casein originally prepared for the production of diphtheria toxin in peptone free media, and since adapted for other toxins and vaccines. Iron, copper, and other heavy metals have been removed from Bacto-Casamino Acids. This hydrolysate is excellently suited for nutritional studies of microorganisms.

BACTO-CASAMINO ACIDS TECHNICAL is an acid hydrolyzed casein recommended for use in media where amino acids mixture are required as a source of nitrogen, and the sodium chloride content is not a limiting factor. Bacto-Casamino Acids Technical is of particular value in nutritional studies of bacteria.

BACTO-VITAMIN FREE CASAMINO ACIDS is acid hydrolyzed casein, free from vitamins. It is recommended for the preparation of media for microbiological assay of vitamins and tryptophane. This hydrolysate is a valuable aid in studies of growth requirements of microorganisms.

BOTTLED CARBONATED BEVERAGES

Rated Non-Cariogenic

IN COMPARATIVE SUGAR-SALIVA TESTS

The assertion that carbohydrates are a factor in the causation of dental caries represents but one of several conflicting views held by dentists.

Even so, clinical tests indicate, when soft drinks are ingested, the carbohydrate concentration and disappearance time in the saliva, compare most favorably with those of some unsweetened natural fruit juices usually recommended by dentists for a caries-prevention diet.

In their consideration of cariogenic oral conditions, proponents of the carbohydrate view of the caries problem frequently fail to contrast the effect of carbohydrates in solid or semi-solid form, which require mastication, with that of liquids which merely pass through the mouth, such as sweetened beverages.

Clinical investigation has clearly demonstrated that there do exist distinct differences in sugar content of the saliva following ingestion of carbohydrate-containing solids and of such liquids. In the latter class, sweetened beverages are shown not only to cause a lower concentration of carbohydrates in the saliva than do other sugar-containing items commonly consumed, but traces of carbohydrates disappear more rapidly.

MAPHARSEN®

an arsenical of choice for the treatment of syphilis

In the judgment of experienced syphilologists MAPHARSEN ranks as an agent of choice—a selection based on its high degree of efficacy, its low incidence of toxicity, its adaptability to any desired schedule, and its ease of administration. MAPHARSEN rapidly controls infectiousness in early syphilis and produces reversal of serologic signs.

MAPHARSEN, alone or with penicillin, is adaptable to intensive, intermediate, or prolonged treatment schedules. Preparation of MAPHARSEN for injection involves only the addition of distilled water as a solvent, and several doses may be prepared simultaneously for group treatment.

MAPHARSEN (oxophenarsine hydrochloride, Parke-Davis) is supplied in single dose ampoules of 0.04 Gm. and 0.06 Gm., boxes of 10, and in multiple dose ampoules of 0.6 Gm. in boxes of 10.

Alhydrox*

Builds solid immunity step by step

Like Mr. McGinty's brick wall which stands solidly against the ravages of time because he builds it carefully, solidly, brick upon brick, the immunity you build with CUTTER "ALHYDROX" vaccine is solid.

**Cutter trade name for aluminum hydroxide adsorbed products.*

"Alhydrox" *is a CUTTER exclusive*—developed and used exclusively by CUTTER for its vaccines and toxoids. It supplements the physician's skill by producing these immunizing advantages:

1. **"Alhydrox"** *adsorbed antigens are released slowly from tissue, giving the effect of small repeated doses.*

2. **"Alhydrox"**, *because of its more favorable pH, lessens pain on injection and reduces side reactions to a minimum.*

3. **"Alhydrox"** *selectivity controls the absorption of antigens, reducing dosage volume while building a high antibody concentration. Reduced volume means less tissue distention and less pain.*

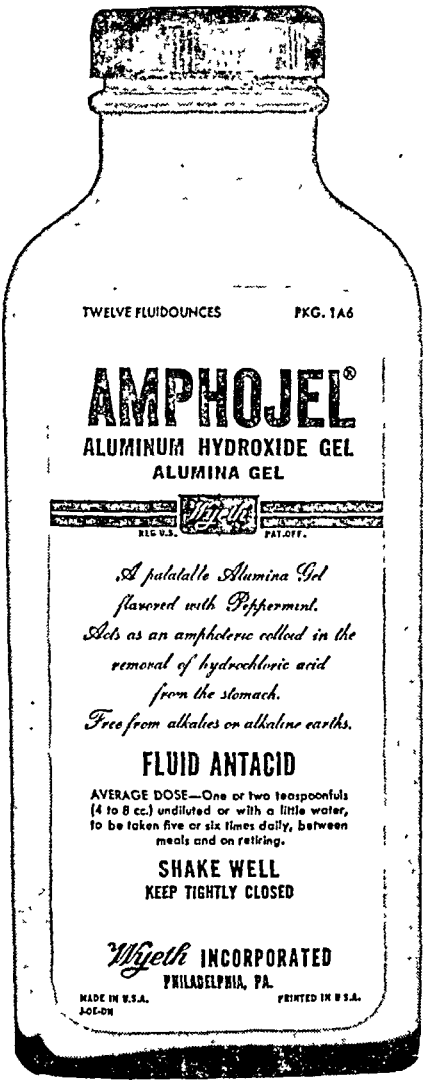
GENUINE **Roccal** BRAND

SANITIZING AGENT

The sanitizing properties of quaternary ammonium compounds are so well known to public health officials that little could be said about them that you do not know. Almost everybody in public health work has added the "quats" to the armamentarium he uses in his war on disease.

The question then, is which "quat"? Are they all alike? Which one can I depend on to do the job expected of it *every* time?

In Roccal, the original quaternary ammonium germicide, you are offered a product that is always uniform in quality because it is made under the most rigid controls. Every batch must pass the comprehensive laboratory tests of one of the world's leading pharmaceutical manufacturers. You can depend on Roccal to do a better sanitizing job *every time*!



When you specify a "quat"

Treat Filariasis Easily and Quickly with

HETRAZAN

DIETHYLCARBAMAZINE

Lederle

The treatment of so large a portion of the population that is affected by a disease as filariasis requires a drug that is easy to administer. HETRAZAN Diethylcarbamazine *Lederle* is such a drug. It is provided in tablet form that may be given orally after meals.

The low toxicity of HETRAZAN and its high specificity for *Wuchereria bancrofti* and *Onchocerca volvulus*, its freedom from any toxic heavy metals, and its stability under varied heat and moisture conditions, make HETRAZAN Diethylcarbamazine *Lederle* the drug of choice in the treatment of filarial disease.

FROM the dairy to the home, bottled milk can be exposed to a wide variety of hazards. Whatever the conditions encountered, if the bottle is capped with Dacro, it's safe. These are the features that make Dacro a really safe cap for milk:

- Forms an *air-tight* seal
- Covers the pouring lip of bottle
- Withstands rough handling
- Is tamperproof
- Eliminates seepage
- Does away with "cap seat"
- Is a perfect re-seal

Best of all, the operating economy of the Dacro P-38 Cap and Capping System means that more and more dairies can give their customers the advantages of Dacro protection.

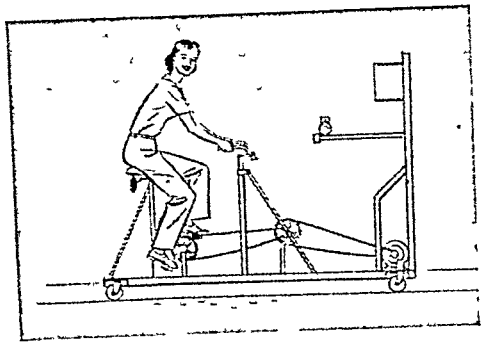
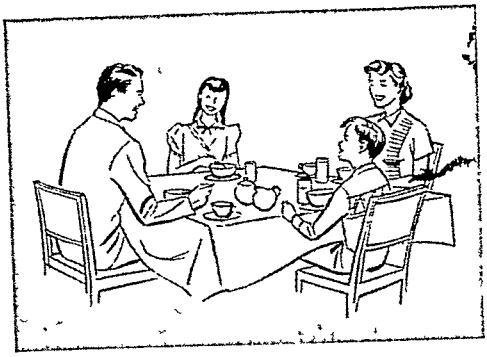
Breakfast Habits



AND MAXIMUM WORK OUTPUT DURING PRE-NOON HOUR



A recent carefully controlled study at the Departments of Physiology and Nutrition of a prominent medical college on the physiologic effects of various breakfast practices shows that habitual breakfast adequacy induces positive physiologic benefits which are objectively revealed by augmented maximum work output at the pre-noon hour. Conversely, the continued omission of breakfast or the taking of coffee only induces physiologic effects leading to a significantly lower maximum work output.

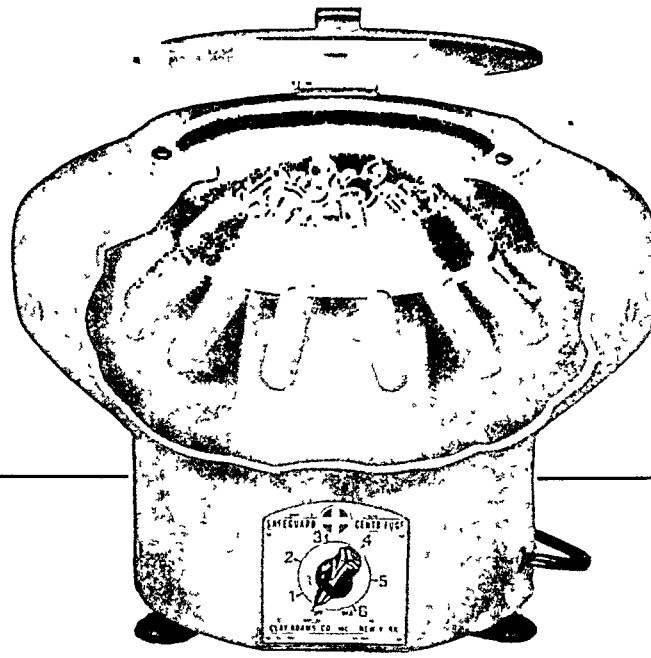
In the light of these findings and to the extent indicated, breakfast adequacy may be said to definitely contribute to physiologic efficiency for greater work accomplishments during the last forenoon hour.

An 800 calorie breakfast, a 400 calorie breakfast, coffee only, and no breakfast during three-week periods constituted the breakfast practices. After habituation to each of the breakfast practices, the maximum work output of six graduate women students, determined by the bicycle ergometer at pre-noon hours, provided the data which when carefully collated justified the following conclusions:

1. When "no breakfast" was the morning practice, maximum work output showed a significant *decrease* at the pre-noon hour.

2. Habituation to coffee only induced a similar *decrease* in maximum work output.
3. When habituation to the 400 calorie breakfast was attained after the coffee only period, a significant *increase* over the findings in the coffee only period in maximum work output resulted.

The conditions of the study did not permit a direct comparison of the effects of the heavy and light breakfasts on maximum work output.



For the first time, this scientific investigation gives *direct experimental* support to the recommendation long advanced by nutrition authorities for eating a breakfast which provides from one-fourth to one-third of the daily nutrient and caloric needs. A good base on which to plan an adequate breakfast is the basic breakfast pattern consisting of fruit or fruit juice, cereal, milk, bread and butter. Although the investigators do not so state, the results of the study strongly imply that maximum work output in the late morning should be increased when faulty breakfast practices are replaced by the eating of better breakfasts.

THE PLACE OF *Candy* IN THE *Balanced Diet*

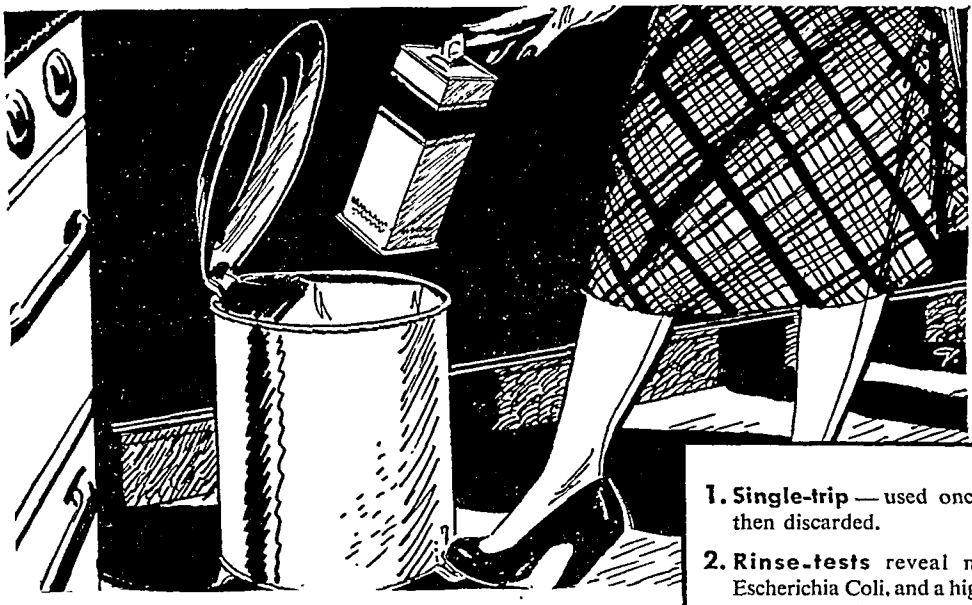
In a carefully chosen, well balanced dietary providing all essential nutrients in proper amounts, there is adequate provision for foods which do more than merely satisfy nutrient needs—foods which are especially tempting to the palate. Candy is that kind of food.

Supplying valuable caloric food energy, it also imparts to a meal a finishing touch of which few other foods are capable. Candy, with its almost irresistible attraction, need not be denied children or adults providing the dietary is adequate in all other respects. In fact, candy at the conclusion of a meal imparts a feeling of satiety and a sense of having eaten well, both of which enhance the functioning of the digestive processes.

Many candies are made of valuable foods in addition to sugar—butter, milk, cream, eggs, nuts and peanuts—and to the extent these foods are present, candies contribute biologically adequate protein, vitamins, and minerals.

THE NUTRITIONAL PLATFORM OF CANDY

1. Candies in general supply high caloric value in small bulk.
2. Sugar supplied by candy requires *little* digestive effort to yield available energy.
3. Those candies, in the manufacture of which milk, butter, eggs, fruits, nuts, or peanuts are used, *to this extent* also—
   (a) provide biologically adequate proteins and fats rich in the unsaturated fatty acids;
   (b) present appreciable amounts of the important minerals calcium, phosphorus, and iron;
   (c) contribute the niacin, and the small amounts of thiamine and riboflavin, contained in these ingredients.
4. Candies are of high satiety value; eaten after meals, they contribute to the sense of satisfaction and well-being a meal should bring; eaten in moderation between meals, they stave off hunger.
5. Candy is more *than a* mere source of nutriment—it is a morale builder, a contribution *to* the joy of living.
6. Candy is unique among all foods in that it shows relatively less tendency to undergo spoilage, chemical or bacterial.



This Platform is Acceptable for Advertising *in the Publications of the* American Medical Association

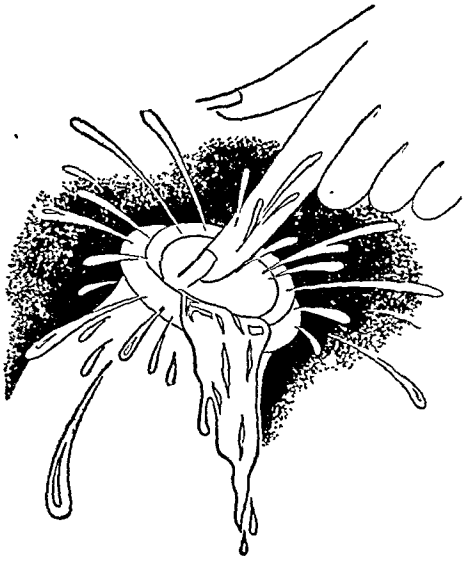
1 NORTH LA SALLE STREET CHICAGO 2, ILLINOIS

The Swiss deliver their milk in large metal tanks with ice chambers set in the tops, placed on wooden pushcarts. The system is ingenious, but hardly sanitary, and opens the possibility of germs causing milk-borne infections.



Americans prefer the single-trip system of Canco flat-top Paper Milk Containers . . . the safe, sanitary system Public Health Officials have sanctioned so widely.

1. **Single-trip** — used once, then discarded.
2. **Rinse-tests** reveal no Escherichia Coli, and a high percentage of complete sterility in containers delivered to the dairy!
3. **Opened, filled,** and closed in minimum time by machines!

CANCO

American Can Company New York, Chicago, San Francisco

PROTECTS CONSUMERS AGAINST *THEMSELVES!*

Milk contamination can too often occur in the hands of the ultimate consumer. Fork-prying and finger-pushing methods of opening bottles and careless discarding of a separate hood—common in both home and restaurant—constitute real threats to milk purity.

Genuine snug-fitting Seal-Kaps minimize these dangers. Seal-Kaps come off with a simple twisting motion. No need to pry or push. And they *snap back on* as often as necessary to protect securely the pouring lip until the last drop is used. There is no separate hood to discard, because Seal-Kap is disc and hood *in one*. And since it's so convenient to use, consumers automatically enjoy a superior protection—protection *against themselves!*

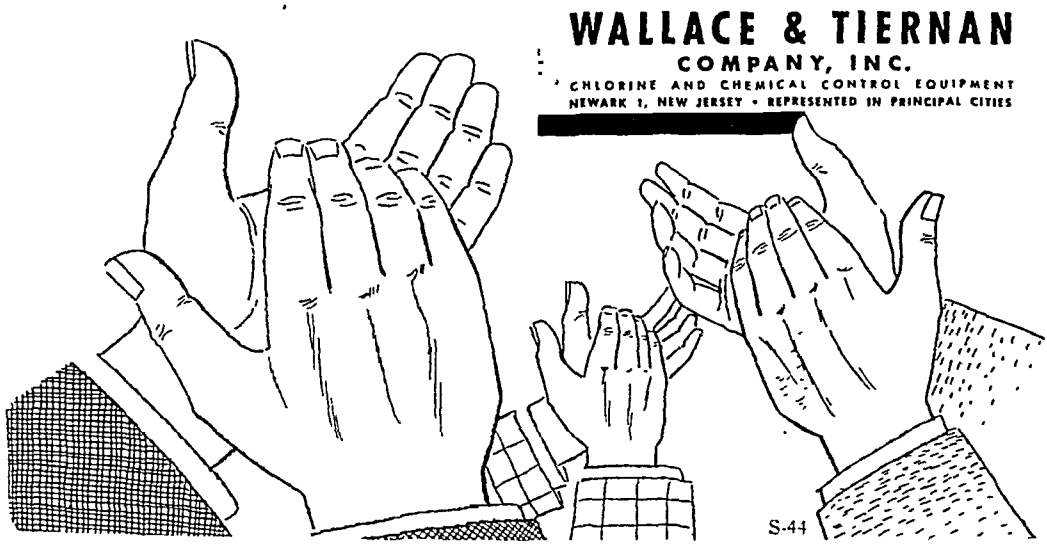
8 YEARS AND STILL GOING STRONG



The ability of the Break-Point Process to meet the various demands of day by day operation is aptly shown by the case history of a municipal water works in Pennsylvania.

Since 1941, when it was installed at this plant by W&T Engineers, the Break-Point Process has played a major role in producing a pure, sparkling water for the system's many consumers. It has completely eliminated complaints on tastes and odors and has raised the finished water quality to such a high level that tests show *no* gas formers and *no* bacteria on the plates. In addition, a staff report continues, the Break-Point Process was of particular value in keeping the water acceptable to consumers during an emergency plant overload of 120%.

These accomplishments and such additional benefits as longer filter runs and iron and manganese removal are typical of what you receive with the Break-Point Process backed by W&T Equipment.

In the complete line of W&T chlorinating equipment, proved by over 35 years' experience all over the world, there is a chlorinator that will give *your* plant these benefits, too.

For more details write to your nearest W&T Representative — he'll be glad to help you.

Psychological Factors in Atomic Warfare*

COL. JAMES P. COONEY, M.C.

Special Projects Division, Office of the Surgeon General, Department of the Army, Washington, D. C.

MANY of the ideas I want to discuss with you today are matters of opinion—and they are, in some cases, ideas on which the diversity of opinion seems to be a function of the number of people who have ideas. I want to talk to you about my ideas with the hope of stimulating thought and more careful consideration of a most important problem.

Please do not interpret any of my remarks as indicating anything less than the fullest respect for the phenomenon of radioactivity as a diabolical instrument of death and injury to man. I only want to point out that we are justified in taking a rather hardboiled attitude toward this subject. Since we have no choice but to live with it, we must keep it in proper perspective.

Since the advent of nuclear explosives in the so-called atom bomb, with its attendant ionizing radiations in massive amounts, unfortunate psychological reactions have developed in the minds of both the military and civilians. This reaction is one of intense fear and is directed against forces that cannot be seen, felt, or otherwise sensed. I have observed the reactions of the military, who were not acquainted with the technical details, on two missions, Bikini and Eniwetok, and the fear reaction of the uninitiated is appalling. The fear reaction of the uninitiated civilian is ever evident. It is of such magnitude that it could well interfere with an important military mission in time of war.

Whenever living cells are affected by ionizing radiation, it is detrimental. It must be realized that nature has been always bombarding the populations of the world with ionizing radiation since the formation of the universe—by constant exposure to cosmic radiations and to radiations emanating from natural radioactive elements—such as radon and thoron.

This kind of injury must be considered, not as standing by itself, but in connection with the total situation, i.e., weighed in relation to the objectives in view, both in regard to their importance

* Presented before the Health Officers Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 12, 1948.

under the circumstances and their probability of attainment. Unless we can thus integrate it with our whole philosophy of national defense, the atom bomb can prove a liability rather than an asset.

With the publicity emanating from the atom bomb, the term "Roentgen" has become a household word. A Roentgen is a term of physical measurement such as the "centimeter" or the "gram." It is based upon one of the physical effects of certain types of electromagnetic waves that cannot be measured with a yardstick. The large step from such a physical measurement to expected biological behavior in human beings is based upon experimentation on lower animals, empirical observations, and clinical investigations. There are, however, many blank spaces in our experience and many superstitions have been introduced. Since it is impossible to stipulate all conditions of experimentation and observation in most of the articles written about radiation for lay consumption, an idea has evolved in many minds that any and all radiation exposure will cause immediate and mysterious injury or death. This reasoning is fallacious, but it is also plausible and has become contagious.

The problem of radiation injury is not one which can be easily simplified. In fact, over-simplification of this danger may be the cause of a situation such as we are combating at this time. It seems desirable to explore radiation hazards more fully in relation to other hazards which are considered more common and acceptable.

The permissible radiation dose is 0.2 or 0.1 r per day, or 0.3 r per week according to your authority. It should no longer be called the "tolerance dose," for no amount of radiation should be tolerated without good reason. One is willing however to name a dose so small that a person might be exposed to it every day of his life and suffer no observable injury or shortening of his life span.

When one is dealing with radiation technicians or with industrial workers who are exposed to this hazard daily in their life's work, he can easily see how the maintenance of exposures at or below this level is a very desirable thing. Day-by-day contact with radiation or radioactive materials demands that a low limit of exposure be adhered to, if one is to avoid late complications of such chronic trauma. Similar occupational hazards exist in all branches of production—noxious gases and dust to the coal miner, the steel worker, and the chemical worker. It has been known for years that, if a miner is subjected to small amounts of dust containing silica, he eventually will develop silicosis, frequently complicated by tuberculosis, and perhaps leading to a fatal termination. For this reason, methods of counting and analyzing dust have been perfected, and forced ventilation systems have been established to minimize the danger. This does not mean that if an individual makes a one day visit to a mine and inhales 100 times the daily minimal allowance for miners that he will develop silicosis. This tolerance limit has nothing in its definition which refers to acute exposure. Neither is the 0.1 r per day tolerance limit related to acute exposure in radiation.

The total body dose of radiation received as an acute exposure is known from therapeutic experience to vary with the patient. This, and the lethal dose for man, have not received the same attention from rule-making bodies that the "permissible dose" has had. We may take 450 r as the median lethal dose.

Going further down the scale, one may consider a limit of 200 r, which may cause radiation sickness in 50 per cent of human subjects when delivered, as an acute dose of total body radiation. Some subjects may be quite sensitive to radiation and others quite resist-

ant, so it is difficult to calculate the precise effects to be expected.

It is not unusual to subject a patient to multiple x-rays of the skull, spine, long bones, gastrointestinal tract, kidneys, sinuses, etc., in a relatively short space of time, thus subjecting him to a dose of radiation which may well approach 25 r. These procedures are not used without purpose and the benefit from the information gained outweighs all fear as to the possible injury from radiation. Full body radiation in doses of the order of 25 r to 100 r have been given to patients for treatment of various conditions. Again, these exposures are prescribed for a purpose which outweighs the fear of radiation injury.

It is not the purpose of this article to underestimate or understate the radiation hazard. But from a military standpoint the physical danger must be evaluated against the objective to be gained.

War is fought with the knowledge that men will be killed. Campaigns are planned with expectation of losing so many thousand men. If you call these "acceptable hazards" then it is obviously not wise to treat radiation hazards very differently. If acceptance of radiation hazard will lessen the other military hazards, then that is what one should accept. This can only be done, however, if the attitude of the men exposed is psychologically similar toward the two types of hazard. If they are going to be as much terrified by the knowledge that a recent atom bomb explosion has contaminated the ground they are walking over as they would be by seeing one in ten of their bodies fall by machine gun fire, one cannot apply the "ideal" solution. What is dominant for actual percentage survival is the resultant of all the actual hazards. But for battle discipline and military effectiveness the dominant measure is not the hazard itself but the soldiers' estimation of the hazard.

Men at war suffer many hazards, acute and chronic, besides bullets. Malaria, venereal disease, exposure to cold and wet, starvation, etc. Some of these, e.g., VD, are under-evalued by the doughboy. Others, e.g., filariasis, are grossly over-evalued. At present radiation is perhaps over-evalued worst of all, partly due to our great care in Operations Crossroads. That operation was conducted at the peacetime level of safety to personnel. Unless we had openly proclaimed immediate danger of war, the military level for hazardous training programs, such as we had actually adopted during the war, using live grenades and live ammunition in the machine guns, was not tolerable at Bikini. It must be emphasized that acceptable hazards in a peacetime operation, cannot be adhered to in wartime.

Psychological training for the military level of acceptable radiation hazard is possible and should be prosecuted, even though operational field training does not permit this to be accomplished at the present time.

We hear much about sterility as a result of exposure to ionizing radiation. It must be borne in mind that sterility results only from a large dose of acute radiation, or from smaller doses over a long period of time—a matter of years. Sterility also results from other accepted hazards encountered in war—venereal disease is one of the foremost causes of sterility. We are aware of hundreds of paraplegics resulting from spinal fractures, gun shot wounds of the cord, etc., during the last war who are not only sterile but impotent. Leukemia may be another late result in casualties from repeated radiation, but amebic dysentery and schistosomiasis carry a great delayed hazard, and so does the effect of beriberi, which was so prevalent among our prisoners-of-war.

I have knowledge of a death at Bikini caused by drinking wood alcohol. There were other deaths due to various types of accidents. At Eniwetok we had a

death due to drowning, one due to a truck accident, and one due to a fracture of the skull encountered in a fight. A sailor sustained a fracture of the cervical spine with severance of the cord by diving into shallow water. He will be paralyzed, sterile, and impotent as long as he lives. None of the above tragic deaths received national news publicity. However, had we had a single death due to radiation, would it have been publicized? It would have received front page publicity throughout the country.

During August, 1946, I interviewed and examined a large number of Japanese who had recovered from radiation sickness. They appeared perfectly normal and were handicapped in no way toward pursuing their way of living. Such is not the case with thousands of our soldiers who participated in "conventional" warfare in World War II. They are handicapped by loss of limbs and eyes. Neither is it true of many of the Japanese who received no radiation injury but received severe burns and traumatic injury as a result of the bombing. It has been estimated that from 5 to 15 per cent of the deaths at Hiroshima and Nagasaki were due to radiation. Why do we concentrate on the 15 per cent and forget the 85 per cent?

The atomic bomb was developed as a blast weapon of war and strategically so used. The radiation effect was never considered to be the prime component of its effectiveness. The destruction attendant to the blast, heat, and secondary fires was paramount. In Japan there was no significant "poisoning" of the ground by fission products or induced activity from neutron capture, and yet many believe that the bomb is primarily a weapon which destroys by mysterious radioactivity.

I have appeared before local defense agencies in many of our cities. They are preparing for defense against an atomic bomb attack—universally they are thinking only of radiation. Invariably they ask, "Where will we get Geiger counters?" Geiger counters are not their only problem—fire-fighing equipment is many times more important, as are well organized rescue squads. "But we have been told that we will not be able to go into a bombed city and rescue the injured." Hiroshima and Nagasaki disprove this. The residual radiation from an air burst bomb is insignificant. The significant prompt radiation occurs in a matter of microseconds and does not extend beyond a 2,000 yard distance. Immediately after such a detonation, such as Hiroshima or Nagasaki, it is perfectly safe to enter into a bombed area and rescue the thousands whose injuries will be such that they will not be able to walk. Unless evacuation of these injured is effected, thousands will be burned to death by secondary fires. Such was the case at Hiroshima and Nagasaki. But how about an underwater or ground burst? In such cases certainly the residual radiation hazards would be increased many fold, but the blast and fire hazards and the prompt radiation hazard would be proportionately decreased, and in my opinion, the total number of casualties would be less.

Much has been written about "poisoned" water. In case the water supply of a city is contaminated by fission products or unfissioned material from an air burst of an atomic bomb, all the evidence on hand at present indicates that after passing through a modern filtration plant the water at the tap would be safe to drink. More work will be done to prove or disprove this statement. We do know from our experience at Bikini that the water from evaporators used on the ship is safe for drinking. Again we must not forget that frequent cases of typhoid fever still occur from drinking polluted water.

If we are to live with this piece of ordnance and ever have to use it again in the defense of our way of living, we must acquire a practical attitude, not

only toward its efficiency or limitations as a bomb, but also toward the possible effects and limitations of this "mysterious" radiation.

We must recognize that the casualties caused by the blast and burns from this weapon will be many times greater than the deaths caused by radiation. We must also dispel the erroneous idea that the rescue work of the injured will be impossible due to residual radiation.

It is of the utmost importance that we recognize that the radiation hazards are *additional* hazards. They only add to the complexity and perhaps even the severity of the other hazards of total warfare. Therefore, we must not and cannot concentrate on this phase of atomic warfare to the detriment of other defensive preparations. Rather, we must know and understand the facts about ionizing radiations if we are to survive the other dangers.

American Board of Preventive Medicine and Public Health Holds First Examination

The American Board of Preventive Medicine and Public Health, Inc., held its first examination for certification on May 14 and 15, 1949, in Washington, D. C. There were 37 candidates, 32 of whom passed successfully. The examination consisted of an all day written examination and of oral examinations given the next day. In the oral examination the candidates were examined individually by an oral board. The written examination was of the objective type and consisted of 400 questions in the following areas of knowledge:

I. *Health Protection and Promotion*
- Geriatrics and Chronic Diseases
- Maternal and Child Health
- Mental Health
- Nutrition
- Oral Health

II. *Environmental Sanitation and Industrial Health*

III. *Communicable Diseases*
- (Including Tuberculosis and Venereal Diseases)

IV. *Public Health Laboratory*

V. *Public Health Practice*
- Administration
- Laws

VI. *Background Knowledge and Techniques*
- Health Education
- History
- Public Health Nursing
- Statistics

The next examination for certification will be given in New York City just prior to the Annual Meeting of the American Public Health Association on October 22 and 23. Applications should be sent as promptly as possible to Dr. Ernest L. Stebbins, Secretary-Treasurer, American Board of Preventive Medicine and Public Health, Inc., 615 N. Wolfe St., Baltimore, Md. For requirements and qualifications, reference should be made to the *American Journal of Public Health*, Vol. 39, page 426 (Mar.), 1949, and page 561 (Apr.), 1949. It should be noted that no persons will be admitted to the Founder's group after July 1, 1950.

Water-borne Diseases*

I. H. BORTS, M.D., F.A.P.H.A.

Director, State Hygienic Laboratory, Iowa City, Iowa

THE subject about which I have been asked to speak today is an all-inclusive one, involving directly and remotely a disturbance of function or structure of any organ, tissue, or fluid of the body by water. This is such an enormous task that the time allocated permits only an abbreviated discussion of the subject with emphasis on one phase in which we have been particularly interested.

During the latter part of the 19th century, enteric bacteriology became a reality. Between 1880, the time when Eberth described the etiologic agent of typhoid fever, and the first few years of the 20th century, many of the present-day enteric pathogens were recognized; but it was not until the latter part of the first decade of the 20th century that much was known about the epidemiology and control of these diseases. At this time water played a very important role in their spread.

With improvements in the sanitary handling of food, the use of modern treated water supplies, and the sanitary disposal of body wastes, a marked progressive reduction in the incidence of enteric disease and of carriers has taken place. Public water supplies have been improved and so closely guarded that water-borne outbreaks of enteric disease from this source are becoming a rarity. Of recent years those few outbreaks reported in the United States, in which public water supplies were incriminated,[1] have been traced to accidents or breaks in sanitation such as back siphonage, inadequate chlorination, cross-connections, surface pollution, defective well casings, and ruptured sewage mains contaminating the supply. This speaks well for the marked advances made in sanitary engineering.

Many elderly practising physicians in Iowa have informed me that in the early part of the 20th century they saw many more cases of typhoid fever than obstetrical cases and that treatment of cases of typhoid constituted the greater share of their practices. "In 1900 over 23,000 people in the United States died of typhoid fever[2] and more than 100,000 deaths were due to diarrhea-enteritis and dysenteries. In 1944, the deaths from typhoid fever were less than 600 and deaths from the other enteric diseases dropped to about 15,000." Today, few Iowa physicians see a case of typhoid. During 1947, 3,062 cases of typhoid fever were reported to the U. S. Public Health Service,[3] of which 46 were reported for Iowa. Up to September 1, 1948, 20 cases have been reported in Iowa all due to heretofore unrecognized carriers. Five new carriers were responsible for these cases. In so far as I can find, outbreaks of typhoid in Iowa during the past 20 years have been traced to food handling carriers. In several borderline instances either soft drinks, water, or food may have been the source. "For the past thirteen years not one case of typhoid has been traceable to a public water supply in Michigan,"[4] according to the Michigan Department of Health.

* Presented before the Engineering Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

The importance of a water supply is so well fixed in the minds of the laity that when a case of typhoid is discovered, the tendency still remains for checking the water and milk supply for typhoid organisms before any consideration is given to the human carrier who transmitted the infection to the vehicle. In such instances, testing the water and milk in most instances is rarely warranted, except when epidemiologic evidence indicates.

During World War II, a marked increase in enteric and other diseases spread by water occurred in war-ravaged areas, save for England where safe water was maintained. Many water supplies and sanitary installations were bombed out, and in many instances replacements were impossible. With this breakdown and inadequate substitutions, typhoid fever, salmonellosis, and dysentery increased in alarming proportions. With the increase in cases, there was a proportionate increase in carriers. This increase in cases and carriers, lack of adequate sanitary disposal of body wastes, and food contamination led to marked pollution of wells, springs, and streams, resulting in a vicious cycle. So polluted became the streams that typhoid bacilli could be isolated from them and vaccination of human beings against typhoid was not entirely effective. Bathing in the streams added to the gravity of the situation. The finding of many carriers[5] following mild and asymptomatic typhoid and salmonellosis was not unusual.

When the improvised water supplies were chlorinated but without filtration, amebic dysentery and other intestinal parasitic diseases increased. It has been stated that cysts of *Entamoeba histolytica* resist ordinary chlorination[6] and that their removal can be accomplished by filtration. In some of our observations on embryonated ascaris ova it was noted that the embryos will resist 10 per cent formalin, and 10 p.p.m. chlorine for as long as four years under icebox storage. Apparently the shell membrane becomes impervious to these agents. To what extent other parasitic pathogens will resist chlorination needs further study.

In 1946, 32 outbreaks of water-borne disease were reported to the Public Health Service,[1] involving 4,512 cases with 2 deaths. Only 9 of these were traced to public water supplies while 22 were traced to private supplies and 1 to the use of a tidal basin for wading. In comparison with this, there were 318 outbreaks due to food products with 13,321 cases and 17 deaths reported.

Private water supplies continue to remain a source of minor outbreaks. The above figures reported I feel represent but a small portion of the actual occurrence of disease from private water supplies. Over a period of some thirty years, approximately 70 per cent of the farm wells in Iowa were found basically unsafe and were so proved on analysis of the water in our laboratories. Not only are these supplies contaminated from nearby privies, but they are subject to pollution via defective platforms and casings, from rains, and by fowls and animals permitted to run at large in the yard where the wells are located.

Infections by organisms of the *Salmonella* group are quite frequent among farmers whose water supplies are unsafe. Whether these infections can be traced solely to water, requires further detailed epidemiologic study of the entire farm population as well as of the water. It appears from meager epidemiologic data and cultures of stools in isolated instances that certain proteus and paracolon species found in farm wells in Iowa are pathogenic and are capable of causing diarrhea. Here again, more detailed studies are essential to eliminate animal sources of infection.

Although water supplies have not been definitely incriminated as a source of poliomyelitis, epidemiologic investi-

gations suggest that contaminated streams and improperly operated swimming pools may serve as a focus of infection. Poliomyelitis virus has been isolated from sewage, and it has been shown that the virus will resist ordinary doses of chlorine.

Some of the less common diseases that have been transmitted via water are those caused by chemical poisons such as lead, arsenic, and cadmium; poisoning from water-borne plants and shellfish; a wide variety of parasitic diseases; tularemia; brucellosis, shigella infections, epidemic jaundice, and Weil's disease. The status of minerals such as chlorides and manganese needs further study. The status of cyanogen compounds in water, traceable to algae, likewise needs further study.

A disease commanding a great deal of attention recently is that of fluorosis or mottling of the tooth enamel. It appears fairly well substantiated that dental caries is definitely decreased in areas where the well water supplies contain fluorine in concentrations of 1 p.p.m., and that supplies containing increased amounts above 1.2 p.p.m. show progressive increases in mottling. Control studies now being conducted in cities in which 1 p.p.m. fluorine is being added to the municipal water supply should give more definite information.

Cyanosis or methemoglobinemia in infants due to nitrates in farm well water continues to be a problem in Iowa since its recognition by Comly.[7] The actual incidence of this condition is unknown, due to lack of adequate reporting. Our attention is periodically called to cases in which parents of cyanotic babies or physicians are interested in tests of the well water involved as well as that of neighbors who have deep wells. Johnson and his associates [8] have reported the incidence of nitrate nitrogen in various types of private wells in Iowa. These data clearly indicate that a hazard to infant health exists in our rural areas from this source. Gilbert Kelso, Principal Water Analyst, and his staff in the Iowa State Hygienic Laboratory, have compiled data for 1½ years on 2,313 water supplies from private wells submitted for routine analysis. Of this number, 1,943 were less than 100 ft. deep and 645, or 28 per cent, contained NO_3N (nitrate nitrogen) above 20 p.p.m. Of 370 wells over 100 ft. deep 13, or 3.5 per cent, contained NO_3N above 20 p.p.m.

In another statistical study, involving 3,833 private wells, including 874 wells having above 20 p.p.m. NO_3N, 112, or 13 per cent, did not contain coliform organisms by standard methods of examination. Seven hundred and sixty-two, or 87 per cent, of these water supplies containing above 20 p.p.m. NO_3N also gave positive coliform tests. Therefore, it seems logical to conclude that the standard tests for coliform determination will rule out most of the nitrate-bearing waters as unsafe.

Of 1,475 well supplies containing from 0 to 10 p.p.m., NO_3N, 819 were under 50 ft. in depth, 304 were between 50 and 100 ft., 144 between 100 and 150 ft., 90 between 150 and 200 ft. and 118 above 200 ft.

Of 181 well supplies containing 11-20 p.p.m. NO_3N, 144 were under 50 ft., 32 were between 50 and 100 ft., 4 were between 100 and 150 ft., and 1 between 150 and 200 ft.

Of the 2,313, no wells over 200 ft. showed more than 10 p.p.m. NO_3N. In general, it may be said that the deeper the well the less likelihood there is that the water will contain NO_3N in sufficient quantity to cause cyanosis.

Out of 69 cases of cyanosis in infants traceable to water during this same period, 27 supplies contained 50 p.p.m. NO_3N or less, while 42 supplies contained from 51 to 801-plus p.p.m. Of the water supplies involving these cases, 53 were bacteriologically unsafe whereas 16 contained no coliform bacteria.

You may ask what concentration of NO_3N in water is capable of producing cyanosis in infants? This question I feel can be answered only after more complete statistical, clinical, and epidemiological data have been accumulated. From data submitted with well water specimens to our laboratory, cyanosis was associated with use of water in which at the time of the analysis 20 p.p.m. were found in 4 instances, 15 p.p.m. in 2 instances, 10 p.p.m. in 1, 9 p.p.m. in 1, 5 p.p.m. in 1, 2 p.p.m in 1, 0.4 in 1, and in 2 instances no detectable nitrates. Whether the cyanosis in the latter instances were due to congenital heart disease or other causes I cannot say. However, we are well aware of the fact that marked changes in nitrate levels in water will vary on periodic testing, from causes which we cannot define. It is possible that chemical fertilization of the soil and rains play an important role in the varying nitrate content of rural wells. In one instance, at the time of cyanosis in an infant the well water was found to contain 70 p.p.m. NO_3N whereas two weeks later analysis of another sample showed only 10 p.p.m.

There are apparently many problems which remain unsolved in relation to this disease. One of the mysteries is why cyanosis does not occur in all babies fed on artificial formulae diluted with high nitrate-bearing waters. It has been quite well established that when nitrate compounds in water are converted by bacterial action in the intestinal tract of certain infants to nitrites, the latter are absorbed into the blood, resulting in the oxidation of hemoglobin to methemoglobin, thus leading to cyanosis. A number of controversial theories have been advanced as to why certain infants who ingest these supplies do not contract the disease. These theories I will not discuss here as they are highly controversial.

Another question which might be asked is, whether adults suffer from the presence of the nitrates in water. The answer at this time is not definitely known. Diarrhea has been noted in some adults at the same time their offspring have diarrhea and cyanosis.

In spite of the enviable record made in reducing water-borne diseases, as health educators we fail in many respects to get over to the public the necessity of following accepted sanitary practices, which, if followed to the letter would for all practical purposes eliminate water-borne diseases. To maintain this record we must make certain that persons in charge of operating water plants and those who examine water for purity must be thoroughly trained and fully aware of the responsibilities of their positions. The job has been well done; let us strive to perfect it. We must continue to guard closely our water supplies in order to maintain the excellent record established.

CONCLUSIONS

1. Water-borne outbreaks of disease from public water supplies have been practically eliminated in the United States save for those due to accidents and breaks in sanitation.
2. Data are presented showing the relationship of nitrates in rural water supplies to the depths of the wells.
3. Sixty-nine cases of infant cyanosis associated with NO_3N in rural water supplies are reported.
4. There appears to be close correlation between the NO_3N content of rural water supplies and their coliform content.
5. Accumulated data suggest that in cyanosis emergencies, water from properly constructed drilled wells over 200 ft. in depth may be tentatively substituted in infant formulae until safety tests can be adequately checked.

Medical Care Section Created in California School of Public Health

A Section in Medical Care Administration has been established by the University of California School of Public Health at Berkeley. The new curriculum complements the school's existing programs in hospital management and public health administration. Qualified graduate students may major in medical and hospital administration courses leading to the M.P.H. degree. Edward S. Rogers, M.D., dean of the school, heads the joint division and E. Richard Weinerman, M.D., is developing the new medical care curriculum. Drs. Sydney S. Norwick, Berkeley, and Dean A. Clark, new administrator of the Massachusetts General Hospital in Boston, are part-time visiting lecturers. A small research staff, headed by Charlotte F. Muller, Ph.D., is making medical economics field studies. The section will serve as a source for consultation in problems of medical care, offering technical aid and other help to interested persons or organizations and as a repository of factual data in medical economics.

Standards of Dental Care for the Different Age Groups*

ALLEN O. GRUEBBEL, D.D.S., M.P.H., F.A.P.H.A.

Executive Secretary, Council on Dental Health, American Dental Association, Chicago, Ill.

IN recent years considerable attention has been given to the need for establishing minimum and optimum standards of health care. These terms imply that some health services are more essential than others and that the status of an individual's health may be determined by the type and amount of health care he receives.

Although common agreement has not been reached as to minimum and optimum levels of health care, the dental and medical professions are attempting to establish criteria which will aid in making the best use of health service facilities.

Probably none of the health professions has experienced so rapid a change in treatment objectives as has the dental profession. In less than a quarter of a century its main interests have changed from mechanical repair to prevention—from a skilled art to a biological science. This evolution is only now beginning to make an impact upon the practice of dentistry and upon the administration of public dental health services. Thus, it is safe to assume that the selection of standards of dental care today can be only a transitory selection and subject to continuous revision as new methods are found to prevent or control oral diseases and defects.

ORAL HEALTH DEFINED

Definitions of physical, mental, and emotional health are difficult, probably because the physiology and functions of the body and mind are not fully understood. Similarly, it is difficult to establish a definition of oral health.

One definition of mouth health, which seems to satisfy current requirements and is in keeping with present-day knowledge, is a modification of a definition of health by Lawrence J. Henderson of Harvard University and was prepared by the graduate students in public health dentistry at the University of Michigan.[1] This statement defines oral health as

> ". . . the objective which the dental profession has in mind in assisting the individual to achieve a satisfactory state of function, comfort, and appearance, provided that his condition has been completely appraised, that he has been informed of existing defects, and that proper treatment has been suggested and made available to him."

Dr. B. B. McCollum[2] has suggested essentially the same definition but in fewer words. He stated that "the normal mouth, as far as the individual dentist is concerned, is what he thinks it should be." In support of this definition Dr. McCollum added that "the concept of the normal is dependent on the intelligence and the education of the man behind the concept."

Optimum oral health, then, cannot be measured precisely until a more scientific method of appraisal is found.

---

* Presented at a Joint Session of the Medical Care and the Dental Health Sections of the American Public Health Association, at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

Furthermore, the attainment of optimum oral health is dependent upon the availability and proper use of all the preventive, diagnostic, and treatment aids known to dental science.

ORAL ILL HEALTH DEFINED

It would be safe to say that at the turn of the present century oral ill health was associated mainly with dental caries, pyorrhea, and impaired function as a result of missing teeth. Today, a thorough oral diagnosis would include examinations for impaired masticatory function, caries, and hypoplasia of the teeth, periodontoclasia, mal-occlusion, and other anomalies, cysts, tumors, malignant and precancerous lesions, oral manifestations of systemic disturbances and traumatic injuries.

Complete dental care would involve the use of all effective measures to prevent these conditions, and in case they do occur, to cure or correct them.

When circumstances prevent the full use of these measures the level of dental health is, obviously, lowered. Some health workers have attempted to fix the lowest "acceptable" point on this imaginary scale with the view of establishing a minimum standard of dental care. Such attempts have not been successful because it is difficult, if not impossible, to compromise with the objectives of a health service. A minimum standard of dental care will assure us of only one thing—a low standard of dental health.

DENTAL CARE STANDARDS FOR CHILDREN

In 1945 the American Society of Dentistry for Children formulated minimum standards of dental care for children at the request of the Council on Dental Health of the American Dental Association.[3] It was the considered opinion of a representative group of pedodontists that in order to meet minimum requirements for growth, development, and health, dental services for children should include:

1. Periodic examinations, including x-ray diagnosis
2. Dental prophylaxes
3. Restoration of carious teeth with silver amalgam or silicate fillings, or with metal castings if necessary
4. Pulp treatments, including cappings, partial or total pulpectomies when indicated
5. Anesthesia, when necessary for the control of pain
6. Preventive orthodontic appliances to maintain space and to prevent mal-occlusion
7. Prosthetic appliances, when needed to replace missing teeth and to restore function and satisfy esthetics
8. Treatment of periodontal disease and mouth infections
9. Extraction of hopelessly diseased, impacted or supernumerary teeth
10. Surgical procedures when necessary for the health of the child
11. Patient and parent education to encourage the application of scientific knowledge for the prevention of disease and the promotion of health

Recent studies have shown that the topical application of sodium fluoride should be added to this list. The Society of Dentistry for Children, undoubtedly, would agree to the addition of this caries-preventive measure.

To many people, this list of dental services represents a relatively high standard of dental care, probably because of the prevailing practice of judging standards by the amount of service most children now receive.

Dental services, all too frequently, are limited to prophylaxes, fillings, and extractions, but such substandard dental care tends to give a false sense of security to both the parent and the child. The neglect of other conditions needing treatment almost always results in a more involved condition requiring extensive treatment in later years.

Unfortunately, there is no immediate answer to the problem of supplying even minimal dental services for all children. Therefore, in order to protect the dental health of as many children as possible, the health professions might well con-

sider the proposal of Dr. Norman F. Gerrie to make available, as far as possible, the most essential dental services. Dr. Gerrie, in a paper presented during the 1946 meeting of this Association, listed the following services in their order of importance[4]:

1. Examination and diagnosis
2. Treatment of acute or painful conditions of the mouth
3. Treatment or removal of hopelessly diseased teeth and partial pulpectomy for young permanent teeth with vital exposed pulps
4. Treatment of gingivitis or mouth infections which have passed the acute or painful stage
5. Repair of injured or carious permanent teeth
6. Restoration of carious primary teeth
7. Orthodontic and prosthodontic care
8. Dental prophylaxis
9. Correction of anomalies such as cleft lip and palate

The topical application of sodium fluoride should be added to this list, also.

While most dentists probably will agree that these dental services are as essential as any, many other dentists will point out that the selection of the most essential services is simply a matter of personal opinion and is not, necessarily, based on adequate scientific evidence.

Orthodontic services, for example, may some day prove to be high on the list of essential services. The health professions are finding increasing evidence of the value of orthodontic care to the physical and mental well-being and social adjustment of children and youth. It has been estimated that there are approximately 40 million children under the age of 16 years in the United States, of whom 7 to 8 million need major orthodontic care and of whom less than 4 out of every 100 who need it are actually receiving treatment.[5]

It cannot be said with any degree of finality, when thinking of the cumulative effect on all aspects of life and health, that the neglect of one oral disease or defect is significantly more damaging than the neglect of another.

Thus, it would seem that standards cannot be set without an acceptable yardstick, scientifically conceived. Without benefit of such a yardstick we have no other choice than to rely on majority professional opinion in the adoption of standards of dental care for children.

DENTAL CARE STANDARDS FOR ADULTS

Standards of dental care for adults, like those for children, should be based on the prevention, early detection and treatment of oral diseases and should aid the individual to achieve a satisfactory state of function, comfort, and appearance.

As was stated before, the old concept of dental practice, limited mainly to the repair or extraction of carious teeth and the construction of prosthetic appliances, is no longer acceptable. Dentistry has more to offer than the mechanical repair and replacement of teeth, skilled as those services have become.

Modern standards of dental care for adults involve the prevention and treatment of (1) diseases of the teeth; (2) periodontoclasia, (3) anomalies, (4) cysts, (5) malignant and pre-cancerous lesions, (6) oral manifestations of systemic disturbances, (7) traumatic injuries, and the preservation or restoration of mouth function.

Again, as in the case of dentistry for children, a lowering of these standards must inevitably result in a lower level of oral health.

Indifference on the part of individuals to the need for complete dental care, or lack of dental resources to provide it, often necessitates the restriction of services to those that are the most essential. It would seem logical that the services that promote health and restore function should be sacrificed last in such cases.

Restricted services for adults in the order of their importance are:

1. Examination and diagnosis
2. Treatment of acute or painful conditions of the mouth
3. Elimination of pathosis
4. Correction of irritations that may result in malignant lesions
5. Treatment or removal of hopelessly diseased teeth
6. Treatment of periodontoclasia
7. Repair of injured or carious permanent teeth
8. Dental prophylaxis
9. Replacement of lost teeth and restoration of function
10. Patient education

In recent years recognition has been given to the need for rehabilitating persons for employment. The dental services listed above might well be used as a guide for vocational rehabilitation. The prime purpose in these cases would be to correct those oral conditions, as a temporary expediency, that interfere with the individual's employment.

CONCLUSION

The rapid growth of the body of knowledge that makes up the practice of dentistry is producing evolutionary changes in our concepts of oral health, mouth function, and dental service. Our new knowledge has resulted in a fuller appreciation of oral health and of high quality dental service, which is commendable. Our new knowledge also has resulted in a feeling in some quarters that the dental health problem is beyond solution, which is unfortunate.

Actually, our new knowledge is providing us with clues for future action. These clues strongly suggest that our goals cannot be reached if we continue to follow outmoded and therefore unacceptable standards of dental care. But our goals can be reached by insisting on the highest possible standards based on authentic information, and if circumstances demand curtailment of service, by putting to the fullest use those services we know to be most essential for physical and emotional health, for growth and development and for optimum function.

The Caries Problem of the School Child*

KENNETH A. EASLICK, D.D.S., F.A.P.H.A.

Professor of Public Health Dentistry, School of Public Health, University of Michigan, Ann Arbor, Mich.

EVERY dentist should pause long enough to ask himself the question that many others frequently ask, "What, anyhow, can dentistry contribute to a child's health?"

Were each operator to ponder his answer thoroughly, unemotionally, and scientifically, he should answer: "Dentistry, (1) with family coöperation, can control most children's dental caries; (2) can, with the child's coöperation, prevent or control soft tissue inflammation and disease of the supporting tissues of the teeth—and even can establish a regime of home care and periodic office treatment that will prevent much of the periodontal disease of adult life; (3) can, with specialist coöperation, correct malocclusing teeth, and prevent a relatively small number of the gross tooth irregularities that may interfere with mastication, with the health of the supporting tissues, and with the emotional stability of a young person; (4) can, with specialist coöperation, treat the problems arising from anomalies of the oral cavity—the cleft palate, congenitally missing teeth, supernumerary teeth, hypoplastic teeth, and other developmental dental abnormalities; (5) can treat and restore young teeth involved in accidents; (6) can detect oral cancer in the early stages; (7) can prevent and eliminate oral infection which may contribute to body disease."

When the dentist himself answers the challenging query presented by some professional and many non-professional persons, he convinces himself readily of his extensive contribution to the public's health. With this conviction comes the realization that a complete, modern, scientific oral health program for all would utilize more health personnel and require a greater share of the health dollar than almost any other of those services in the congeries of activities designed to assure the public's health. Economical preventive and control technics are urgently needed for dentistry.

My task, in the limited time available, is to present just one of these health contributions of the dentist—the control of dental caries in school children. To aid school health people to achieve reasonably scientific conclusions and to make reasonably scientific statements about dental caries, it seems pertinent to divide my task into three lesser tasks: (1) state the mechanism of dental caries; (2) delimit clearly those factors which are essential for caries to occur; and then (3) appraise the value of the control measures currently provided by research.

A. THE MECHANISM OF DENTAL CARIES

Thirty-nine of 61 health education pamphlets dealing with dental care, which were appraised by a class of graduate students of public health during the spring semester of 1947–1948, started off with some modification of the apologetic statement, "We don't know

* Presented before the American School Health Association and the Dental Health Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

what causes tooth decay, but . . ." A detailed list of measures invariably followed, which, adopted by the reader, would prevent dental caries—cause unknown. These pamphlets were the results of the health promotion efforts of classroom teachers, principals of schools, health educators, physical education directors, pediatricians, obstetricians, nurses, biochemists, dieticians, nutritionists, dental hygienists, and in one instance, an anthropologist. Obviously none of these writers possessed a thorough background of information about the development, microscopic structure and physiologic processes of vital human teeth, although some acknowledged the assistance of local dentists. In view of the authorship, it seems pertinent to point out that dentists do know the cause of dental caries, although they may not know some of the factors involved in immunity or lack of susceptibiltiy to caries and, likewise, a number of the factors that can be utilized in caries control.

A year ago last September, 114 scientific people, many of them internationally known for their caries research, spent a week in a workshop on the evaluation of caries control technics at the University of Michigan. With the assistance of research, statistical, and librarian consultants, the present status of information about the process and control of caries was appraised most critically. The committee, which was assigned the evaluation of the mechanism of the caries process, reported after a week of study: "Dental caries is a disease of the calcified tissues of the teeth. It is caused by acids resulting from the action of microörganisms on carbohydrates, is characterized by a decalcification of the inorganic portion and is accompanied or followed by a disintegration of the organic substance of the tooth."[1]

Perhaps it should be reëmphasized, then, that dentists do know the cause of dental caries and they know that bacteria, fermentable sugars, and organic acids are involved. Some further conclusions of a second evaluating committee of the Michigan Workshop also should be repeated at this point. Stated briefly, this group's conclusions were: pregnancy and lactation in themselves are not a cause of dental caries[2-12]; sickness, general health or nutritional status, with minor reservations, have little significant bearing on the caries process[1-3, 11, 13-20]; there is no proof or clinical evidence of a relationship of endocrine disturbances and the caries index[21, 22]; and no clinical or experimental evidence is available to support the theory that one's emotional state may influence dental caries.[23]

With a definition of dental caries available as a guide, I should like to turn to my next task.

B. THE FACTORS ESSENTIAL FOR DENTAL CARIES

Somewhat over-simplified perhaps, but nevertheless quite readily understandable, the factors may be outlined which are essential for dental caries. In the first place, the patient must be susceptible to dental caries; very few people are immune. In the second place, the patient must have teeth and the hard tissues of his teeth must be soluble in weak organic acids. In the third place, acidogenic (acid-forming) bacteria, certainly, and apparently aciduric (acid-tolerating) organisms must be present and active in large numbers in the patient's mouth. In the fourth place, the food, the substrate on which aciduric bacteria live, must be made available frequently in the patient's mouth; in other words, the host must ingest fermentable carbohydrate and usually in the form of sugar. In the fifth place, certain specialized "promoters" of chemical activity, the necessary enzymes, must be present in the patient's mouth or must not be inhibited when manufactured by resident

bacteria, because at least 13 chemical reactions[24] are required to degrade a fermentable sugar to lactic acid. Finally, in the sixth place, the organic acids, once produced, must be protected from the neutralizing effect of the patient's saliva in order that they may react with the mineral surface of a tooth. A tough, adherent film, the bacterial plaque, therefore, appears essential to the caries process.

These six essential factors, (1) susceptible patient, (2) acid-soluble tooth structure, (3) aciduric organisms, (4) carbohydrate substrate, (5) bacterial enzyme system, and (6) bacterial plaque, deserve careful consideration. They serve as research guideposts since interference with any one of these factors, or any combination of them, presents possibilities for prevention or for the reduction of the patient's dental caries. Each, then, will be surveyed in the order listed and some of the technics of possible interference considered.

C. THE SCIENTIFIC CONTROL MEASURES

1. *Patient Susceptibility*

Almost everyone has an "Uncle Ned." Uncle Ned is the obscure relative in one's own or some neighbor's family tree; he is the rare individual who did not brush his teeth, did not go to the dentist, did not worry about the type of food he ate, and lived until a ripe old age with every tooth intact save a few loosened by pyorrhea. He is an immune, and immunity to dental caries has been studied.

Over a period of time, by selective breeding, Hunt and his associates[25] at Michigan State College have developed a strain of rats immune to dental caries and also a strain highly susceptible to caries. Klein[26-30] has reported studies of human families in which members for a few generations have experienced little or no caries. Jay, Crowley, and Bunting,[31, 32] Hill,[33, 34] Williams,[35-38] and Canby and Bernier,[39] all have studied the possible mechanism of immunity. It is known that the lactobacillus is absent from the mouths and digestive tracts and that the blood agglutinin titer to lactobacilli is high in these immune persons. On the other hand, preliminary experiments to secure immunity with vaccines have been disappointing and the principle of biological selectivity for the control of human beings would be too impractical to discuss.

2. *Solubility of Tooth Structure*

Much has been written about "feeding teeth" to make them hard and strong so that they will not decay. Such a presumption appears unwarranted.

Certain hypoplasias of the enamel and dentin of teeth have been demonstrated to be inherited anomalies of development,[13] and further studies may show that much of the macroscopic hypoplasia noted in teeth follows a genetic pattern. At any rate, it can be shown clinically that very well calcified teeth develop cavities frequently and that teeth with gross hypoplasia — tooth crowns even deformed—may not develop any cavities at all.[11, 40] In well calcified teeth probably not more than 2 per cent of the enamel is organic material, leaving 98 per cent of the enamel surface that can be dissolved by acids. Whether this surface is 90 or is 98 per cent mineral should make little difference to the chemical action which initiates caries.

On the other hand, if the surface of the enamel can be impregnated with any insoluble material or changed to become more nearly insoluble in the weak organic acids, a possibility exists for interference with the mechanism of dental caries. In the laboratory, applications to enamel surfaces of solutions of stannous fluoride, silver nitrate, some other inorganic salts, and a few native organic compounds, have made the enamel less soluble in acids.[41-47] Much publicity recently has been given the topical application of a 2 per cent sodium

fluoride solution to children's teeth as a measure to reduce the caries attack rate. This application perhaps provides one method to interfere with the solubility of enamel *in vivo* since 4 applications to the dried surfaces of the crowns of young teeth, following an initial prophylaxis, have reduced the caries attack rate in large groups of children by 40 per cent.[48-51] Some children appear to receive greater benefit and some much less. No evidence is available at present that the teeth of adults can gain any benefit from this treatment.[52]

Electron microscope studies provide an indication that the crystalline surface of enamel is changed by the appearance of new crystals of highly insoluble fluorapatite.[53-56] Previous to this research on the topical application of sodium fluoride, it had been noted that the fluorosed teeth formed in children who, for the first 8 years of life, had continuously drunk a community water which contained fluoride in excess of 1 p.p.m., were much less susceptible to caries than were non-fluorosed teeth.[57] In large groups of 10 to 12 year old school children the attack rate would average two-thirds less than in those children reared on fluoride-free waters. However, since the counts of acid-forming lactobacilli found in the salivas of these children also were reduced tremendously,[58] it is difficult to ascertain whether the caries reduction can be ascribed to lessened solubility of the teeth or to a bactericidal effect on the acid-forming organisms.

The artificial addition of 1 p.p.m. of fluoride to municipal water supplies is now being attempted in carefully controlled experiments to see if this addition will produce the same diminution of caries that results in those areas in which children are reared on the natural fluoride-bearing water. Fluorides used in mouth washes and chewing gum, or ingested in tablets, have not been demonstrated to be beneficial to children's teeth.[59-61] Calcium fluoride, the form found in tablets and bone flour, is one of the most insoluble fluorides.

The other compounds that have reduced the solubility of extracted teeth in the laboratory either have not been tested extensively in the mouths of children or have failed to affect the caries process when tested on living teeth in their normal environment. Lead fluoride has proved innocuous[47] and the efficiency of silver nitrate still is to be proved when used under the conditions of routine dental practice.[62]

Recently, considerable publicity also has been given to a technic for the prevention of caries by the impregnation and "plugging" with insoluble salts of the bundles of organic fibers which frequently are trapped in tooth enamel during its formative period.[63, 64] The basis for this technic is the belief that caries begins as a proteolytic process in these so-called vulnerable "organic pathways." Following a prophylaxis, an agent to dissipate surface tension is applied to the surfaces of the dried teeth and the crowns, then moistened successively with solutions of zinc chloride and potassium ferrocyanide. Controlled research, involving a large number of children, is required to evaluate this technic thoroughly. In the meantime, it may be pointed out that these bundles of organic fibers very frequently are completely absent in the area of a cavity in a tooth.

3. Acidogenic Organisms

A number of microörganisms are able to produce sufficient localized acidity to decalcify enamel.[65-71] Among these bacteria are strains of streptococci, yeasts and lactobacilli. So much evidence has been submitted to substantiate the role of acid-forming bacteria in the caries process that school health workers, it would seem, can accept this role without further questioning. The lactobacilli, in fact, can produce such a low pH, can

live in such an acid environment and are present so consistently in the salivas of children experiencing active caries, that the number of them found per ml. of saliva now is used as a caries index.[72, 73] Lactobacilli counts are being furnished to dentists by a number of state laboratories.

Inasmuch as bacteria are among the essential factors for the caries process, their reduction, their elimination or any serious interference with their metabolism or multiplication all provide possible technics of caries control. Lactobacilli have been eliminated from the mouths of children by the drastic removal of readily fermentable carbohydrates from diets.[72, 74, 75] In experimental groups of children and college students, lactobacilli have been reduced in number by the use of penicillin in dental powder twice daily.[76-78] Ammonia nitrogen developed naturally in the bacterial plaques has been reported to inhibit the growth of lactobacilli,[79, 80] and well controlled experiments are now in progress in Illinois to test thoroughly the effectiveness of dibasic ammonium phosphate, used as a mouth rinse or a powder dentifrice, in the reduction of the counts of these aciduric bacteria in children's mouths. Recently the presence of the amino acid, tryptophane, in the salivas of patients has been reported to be associated with a reduction in the caries rate,[81-83] whereas the addition experimentally of indol and one other decomposition product of tryptophane to cultures of lactobacilli has been reported to destroy these bacteria.[84] Two other amino acids, alanine and aspartic acid, will in immunes' salivas, readily become deaminized which is the initial step in the breakdown of an amino acid to ammonia.[85]

4. Carbohydrate Substrate

Government reports, it has been pointed out, indicate that sugar consumption increased from 12.1 lb. per person in 1830 to 108 lb. in 1929.[86] Recently, current sugar consumption has been stated much more graphically,[87] "We now, in a year, manage to consume approximately our own weight in sugar."

Since appreciable amounts of fermentable sugars have not been found in freshly secreted human salivas,[88] it would seem that dental caries could be attacked by working on the national substrate. Such attacks have been made. The older of the two well demonstrated control technics for the control of caries, the elimination of readily fermentable carbohydrates from one's diet for short periods, has been proved successful. Literally, the oral aciduric bacteria have been starved to death in the mouths of 83.4 per cent of a demonstration group of 809 coöperative individuals.[72] This type of control has been instituted successfully for individuals in many parts of this country, but it does not seem that it can become a mass control technic in an economy which is increasing its sugar consumption as rapidly as in the United States.

Since, within 3 to 5 min. after the ingestion of sugar solutions, the acidity of dental plaques in caries-susceptible mouths rises to a point sufficient to decalcify enamel and since it may be maintained for 30 to 90 min.,[89-93] the suggestion has been made that the teeth be brushed and the mouth be thoroughly rinsed with water immediately after every meal or snack which includes sugar. Whether this suggestion can be utilized as a practical method to reduce caries, or not, requires testing.

There remain, of course, many possibilities for interference with the complex system which degrades sucrose to lactic acid.

5. Enzyme System

Inasmuch as a set of 12 or 13 enzymes and coenzymes now are known to be essential to produce lactic acid from

sucrose,[24] it seems obvious that an opportunity should be found eventually to attack the caries process through another of its essential factors. It would seem, in fact, that the most productive approach would come from the incorporation in commercial sugar, after its final refinement, of a stable, colorless, tasteless, non-toxic inhibitor of enzyme activity.

Some promising research with organic peroxides and glyceric aldehyde has recently been reported.[94]

Also in the research stage are a number of other possible enzyme-inhibiting processes or agents. Sodium bisulphite,[95] it has been reported, may combine with the aldehydes of broken down carbohydrates and prevent the formation of lactic acid; carbamide (synthetic urea), it has been reported,[96] may react with the enzyme urease to form ammonium carbonate, which, in turn, interferes with acid production; certain of the amino acids have been reported to reduce the acid production of salivas in laboratory experiments[81-83, 97]; the time required for the hydrolysis of starch by the salivas from mouths without caries has been reported to be greater than for the salivas from mouths with caries[98, 99] and that research finding has lead to speculation concerning another attack route; a synthetic quinone, menadione, incorporated in chewing gum, has been reported in an initial experiment to have lowered the caries attack rate by interference with the production of acid.[100, 101]

Finally, thiamin has been stated to be essential for bacterial growth and carbohydrate metabolism and its absence has been associated with a low caries attack rate.[102, 103] Commenting on its elimination from the diet as a caries control technic, one reviewer says, ". . . it is not likely that any of us would advocate that the disease, dental caries, be exchanged for berberi or its subclinical manifestations."[104]

6. Bacterial Plaque

Since saliva maintains itself in the human mouth at a pH relatively close to the neutral point,[105-107] one legitimately might ask the question, "Why does not the saliva neutralize the organic acids as soon as they are formed and thus prevent decalcification of the teeth?"

The answer probably lies in the ready formation of the dental bacterial plaque. Left undisturbed for a few days on "protected" contours of the teeth, organisms, mucin and mouth debris form an adherent, tough, filamentous covering on the enamel surface. Studied microscopically, the plaque reveals a dense, feltlike mass with long filamentous organisms (leptothrix and others) protruding from the outer surface; while, studied bacteriologically, the plaques associated with beginning cavities provide a high correlation with the presence of aciduric bacteria.[108-113] In some of its characteristics the plaque, as studied in the laboratory, behaves like a selective membrane which permits the diffusion of sugar solutions and interferes with penetration and prompt neutralization by the saliva.[110] Salivas, it is true, vary in amounts and in buffering capacity and these factors may account for some of the differences in caries-susceptibility.

Zephiran in 1:1,000 and urea in 50 per cent solutions, which are powerful bactericidal agents in the laboratory, have been able to penetrate intact plaques only with difficulty.[114] The application of the urea solution in the mouth for 4 min. has been reported to interfere with acid production up to 24 hrs.[115] A urea mouth wash now is being tested on a large group of school children along with a dentifrice of dibasic ammonium phasphate. The commercial mouth washes sold in the past were worthless.

To date, a detergent that will remove the bacterial plaques promptly from

teeth has not been reported. The conclusion of the Michigan Conference[1] also was not very hopeful regarding the efficacy of toothbrushing for this purpose: "There is no evidence that toothbrushing, as ordinarily performed will prevent the formation of plaques." At the same time, it was pointed out, that proper brushing appears helpful in the stimulation of healthier gingival tissues.

SUMMARY

Very briefly, it must be admitted, this paper has stated the contribution that dentistry can make to a school child's health, has presented the mechanism of the caries process, has outlined the six factors essential for caries—a susceptible patient, acid-soluble tooth enamel, acidogenic bacteria, carbohydrate substrate, a specialized enzyme system, and the bacterial plaque, and it has reviewed a number of the control technics which researchers are testing for interference with each of these factors. At the moment, it can be said, there is a convincing body of evidence to indicate the validity as control measures of the topical application of sodium fluoride solution and the restriction of fermentable carbohydrates for short periods in children's diets. There also is excellent presumptive reason to anticipate that both the liberation of 1 p.p.m. of fluoride in communal drinking waters and the daily use of a combination of an ammonia-liberating dentifrice with a carbamide mouth wash will be developed as routine caries control technics for children.

Adjustment of the School Program for the Physically Handicapped Child*

SAMUEL M. WISHIK, M.D., M.P.H., F.A.P.H.A., AND ROMAINE P. MACKIE, PH.D.

Chief, Program Planning Section, Health Services, Children's Bureau, Social Security Administration, Federal Security Agency, Washington, D. C.; and Specialist for Schools for Physically Handicapped, Office of Education, Federal Security Agency, Washington, D. C.

Dr. Mackie—We in America have long regarded public education as the rightful heritage of all children. Yet even today we find that there are many educable children who, because of severe limitations, are either not receiving education or are denied access to educational programs suited to their needs.

Estimates suggest that from 4 to 5 million children between the ages of 5 and 19 are so exceptional that special school adjustments are necessary if they are to make optimum progress. Of these, perhaps half, or approximately 2 million children, are physically handicapped.

Dr. Wishik—That term, "physically handicapped," needs defining. From the medical viewpoint, a child is considered handicapped if over an appreciable period he is prevented by a physical condition from full participation in childhood activities of a social, recreational, vocational, or educational nature. For purposes of medical care, handicapped children are ordinarily classified by diagnoses. The school medical administrator, however, recognizes that the school needs a method of grouping which is related to the modifications which are feasible in the school systems. For most situations, four categories usually suffice: first, the children with visual defects, second, those with hearing deficiency, third, those with speech difficulties, and fourth, those with a locomotor difficulty or a general health condition, such as heart disease.

Dr. Mackie—What do you include under the term "general health condition"?

Dr. Wishik—We include among handicapped children those with an internal health disturbance such as diabetes, kidney disease, asthma, or heart disease, when the condition is severe enough to necessitate limitation in the children's activities. Although such children often do not receive the same degree of attention, they are just as effectively handicapped as is the child who carries a crutch.

Dr. Mackie—You would say, then, I assume, that from a medical point of view children with locomotor difficulties may be grouped with those who have certain other health conditions. This point of view is significant in planning for special classes. For example, it seems practical from the standpoint of school administration to place cardiopathic children and children with orthopedic conditions in the same classes where the aim is to provide a protected environment which affords such facili-

* Presented at a Joint Session of the American School Health Association and the Maternal and Child Health and School Health Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

ties as transportation, accessible lavatories, or a shortened schedule.

Dr. Wishik — When, however, special services such as physical therapy are offered to children, there may be reason for separating them from the children who are not receiving such special services. Does this jibe with your philosophy on segregation of handicapped children, Dr. Mackie?

Dr. Mackie — I am very glad you asked that question and that you asked it in just that way. It gives me a chance to say that we do not like the word segregation or the meanings now commonly attached to the term. We regard special classes as a form of special service. It is a positive rather than a negative thing.

When one is inclined to object to a special class, it is well to consider the alternatives. For severely handicapped children, these alternatives usually are exclusion from school, enrollment for home instruction, or attendance in a school not prepared by facilities or personnel to give the child adequate help.

Let us see what some of the special classes provide for handicapped children. Many units for crippled children offer physical therapy and, occasionally, occupational therapy. When such services are provided, the children are under specialized medical supervision, closely coördinated with the school program. The special school or class may also provide other features such as adjusted housing and equipment, nourishment, transportation, rest facilities, special guidance, and parent participation. Examples of special equipment are desks, tables, or chairs designed or adjusted for individual pupils. For cerebral palsied children there may be cut out tables, relaxation chairs, and adjusted instructional materials such as typewriters and large pencils. Such materials and equipment are tools for both the teachers and the therapists.

A program of special education should be a flexible one. It should consist of services scaled to meet varying needs. Our schools are making an increasing effort to enable handicapped children to attend school. When this is not possible, we are trying to take the school to the child wherever he may be—in the hospital, in the convalescent home, in the residential school, and, when no group plan is possible, in the child's own home.

The majority of these children should eventually be assimilated into the regular classes, although many of them will still need adjustments and guidance. Special classes in day schools are somewhat parallel to hospitalization. When a child's best development can be attained in this setting, then he should have it. But he should remain in such a group, just as he would remain in the hospital, only so long as intensive and specialized care is essential to the furtherance of his education and total growth.

For some children, such as the partially seeing and those with certain hearing defects, schools often have divided programs. Under this plan, the child receives from his own special teacher appropriate help by adjustment in instruction and in materials or by speech training or lip reading. At the same time, he spends part of his day in the regular class.

The divided program is likewise in effect for some handicapped children in regular classes. In many places, itinerant teachers going from school to school work with groups and individual children, especially those with speech defects.

Dr. Wishik — The divided program can also be applied to children receiving physical therapy. In this way, the services of the physical therapist can be extended to a larger number of children than would be the case if she treated only those in special classes. Using a divided program makes it possible to

plan for specialized personnel such as physical therapists on an uninterrupted basis while retaining flexibility of transfer of children from one placement to another within the school.

In attaining this flexibility, another difficulty may occur. When a doctor has a sick child under his care, he is interested in protecting the child from the exposures and hazards of a full program of school activities. He is often reluctant to permit liberalizing the child's program. He may, for example, object to the pupil's being transferred from a special to a regular class. Do you find this tendency in the educational field, too?

Dr. Mackie — Yes. School personnel are likewise often reluctant and upon occasion even resistant to this fluid movement from one type of school setting to another. They may, for example, prefer not to admit a child to a class when he has been on home instruction.

School people are sympathetic to the problems of the handicapped, but they are frequently fearful in planning for them because they do not understand the medical implications and sometimes do not know what help the medical people can give them. Each time the school makes a new adjustment for a handicapped child, such as moving him from home instruction to a class, the school increases its responsibility.

Dr. Wishik — This challenges the school health service to give the school staff a better understanding of medical matters. For one thing, the teacher would feel more confident if she had more information on health problems. To be sure, an orientation in health problems benefits all teachers in all classes, but needs even greater emphasis in classes for the handicapped. Here, the teacher has a group of children, each one of whom has a definite physical limitation. In her daily work she must think more definitely in terms of health problems than does a teacher in a regular class. Therefore, the teacher of a special class for the handicapped should have more than the average amount of information about health problems, particularly those related to the special group she is teaching.

The teacher has opportunity throughout the school day to make health observations, even of a rather subtle kind. She can recognize changes in conduct and activity of a child from one day to another. Her observations should be utilized. In addition to giving her special training so that her observations are more meaningful and better understood, it is important that we develop techniques whereby her observations are passed along to the school health service.

Dr. Mackie — Often, the teacher is shy and hesitates to send such information to health people. But if she can get medical interpretation following her referral, she is then in a position to do many things to carry forward the doctor's recommendations. The teacher is likewise stimulated to give greater attention to health problems when she knows that her observations are being given consideration.

Dr. Wishik—Yes, and the school health service should indicate to the teacher in the special class the kinds of observations which she might make and the ways in which she might record and report them. Among the many ways in which teachers and health service can get together and make most effective use of the formers' contributions are through the use of health record forms. Record forms are only a device, it is true, but they do have informative value and they can exert a strong cementing influence on the participants in the program.

In many school health services at the present time, in addition to the health records kept by the health staff, the teacher in each home room keeps a health card for each pupil. On this card

are listed such observations as listlessness, easy fatigue, etc. These items and other specific items should be placed on a special kind of teacher observation card in each type of special class. The special items in a class for visual handicaps would differ from those in a class for instance where children are grouped because of severe cardiac conditions or orthopedic handicaps. For the visually handicapped children, there would naturally be more items about the eyes, such as, rubbing the eyes, squinting, tilting the head, or failure to wear eyeglasses.

In the class for children suffering from general health conditions, more items would relate to poor food intake, disinterest in games, or frequent absences. In the orthopedic class, the teacher and the physical therapist, if there is one, could note whether the student wears his brace or uses his crutch as directed by the physician.

As the teacher develops greater skill in making and recording her observations, she will more readily recognize the indications for referring children to the school health service. In a class containing cardiopathic children the teacher would recognize such danger signals as feverishness or apparent pain. In the class for the hard of hearing she would refer a child at the first sign of a head cold.

In short, I would make a plea for special preparation of the teacher of exceptional children with emphasis upon the types of handicap included in her class.

Dr. Mackie — Standards for the education of handicapped children, as for all children, are set by state departments of education and by local school systems. State-wide programs for exceptional children, including the physically handicapped, are moving forward rapidly. As of January, 1948, 32 states, the District of Columbia, and the Territory of Hawaii each reported one or more staff members in state departments of education carrying responsibility for education of such children. The number of states providing this service more than doubled in the period of 1940–1948. Some states have already established minimum qualifications for teachers of exceptional children.

To meet the needs created by this growing program, many colleges are giving attention to the orientation of all teachers to the problems of exceptional children. Certain colleges and universities are offering comprehensive training in the education of children with locomotor disabilities, the deaf and hard of hearing, the blind and partially seeing, speech correction, and other areas. As the supply of teachers approaches the demand, it will then be possible to require that more special training be superimposed on the usual teacher qualifications. For example, the course for a teacher of the crippled would probably include: (1) general orientation to the handicapped; (2) a survey in orthopedic conditions (with clinical observations) presented by a medical staff; (3) organization and administration of special schools and classes; (4) adjustment in methods and curriculum; (5) psychology; and (6) guidance and adjustment of the physically handicapped.

The fact that we ask the teachers to meet such qualifications does not mean that they will be able to, or should, make medical decisions or recommendations. The physician usually describes the kind of limitation and the kind of placement he believes essential, and then the school tries to put the child in a situation which will fit this as nearly as possible. Teachers understand rather well that no program of special education for the physically handicapped can proceed without continuing recommendations from proper medical authorities. Such recommendations should be carried out.

Dr. Wishik—Yes, but in order for medi-

cal and school people to collaborate in setting up an adjusted program for a given handicapped child, they must be able to talk each other's language. May I refer to a similar problem which arose in industry during the war when procedures were developed for fitting the worker and the job to each other. The physician submitted a report, not as a medical diagnosis, but in terms of the physical capacities of the employee, such as climbing stairs or lifting weights. The factory personnel manager for his part made an analysis of the job in terms of the physical demands which were made upon the worker, rather than merely labeling him as a machine operator or a shipping clerk. A common denominator of physical activities was thus found for describing the worker in both reports.

Similarly, for the school child, it is not enough for the doctor on the one hand to give a diagnosis of "curvature of the spine" or for the school on the other hand to report to the physician that the child is receiving "adaptive physical education." A physician's written recommendation for "limited physical activity" is meaningless unless the forms which are used in passage between school and physician define the term, "limited physical activity." His recommendation will become meaningful if the physician is given opportunity to illustrate what he includes or excludes in his recommendation.

For this purpose, the form should list in specific detail activities which take place in the school and should group them under headings, such as perhaps, "normal activity," "no competitive games," "restricted participation," or "avoidance of academic pressure." Under the headings would be listed such items as, "setting up exercises," "dancing," or "swimming."

The physician can then check a leading group like "no competitive games" as one votes a straight political ticket or he can split his vote and object to any individual activities listed. To permit full democratic process, there should be blank spaces for either the physician or the school to write in additional activities.

It should be made clear that forbidding active participation does not preclude the child's taking a modified role in certain activities. The prohibition of dancing, for instance, helps the teacher to decide on other types of modified participation which she may develop for the student short of complete exclusion.

Of course, the form does not replace personal or telephone communication when these are possible. As a matter of fact the form here described attempts to follow the lines which such communications would most naturally take.

Dr. Mackie—The schools often face another problem. From the physician's report, it is not always possible to know how long the recommendation is supposed to be in effect. A physician may, for example, make recommendation for "home instruction," or he may suggest "a shortened school day." Often, no further word comes from the doctor for a long time, although the physical condition of the child may change materially.

Dr. Wishik—In this connection it is advisable that the medical recommendation and subsequent school placement have limited application in time. In some schools, a recommendation is good for a period of one year. One semester might sometimes be better. Within that maximum, it is hoped that there will be a definitely individualized approach to the needs of each child. If the doctor says that he should see the child within two months, then the school will attempt to get the child back to the physician at that time for a review of status and placement even though it is in the middle of a school semester. A problem which is common among handicapped children is the fact that they are often

subject to repeated illness and hospitalization. What does the school do to attain continuity of educational program for these children?

Dr. Mackie—In some school systems, definite steps are taken to insure continuity of education as the child moves from one school setting to another. Both state and local supervisors of special education are working on this problem. In some communities the physically handicapped child does not as yet have access to all the services he needs—such as school in the hospital or home instruction. This is a problem that remains to be solved in many localities.

Where the necessary variety of services is available, the school records which usually follow the child from school to school help to insure continuity. The trend today is toward a more complete set of records, which will tell something about the social and emotional adjustments as well as academic progress. The academic achievement is given due attention but is not considered the sole objective of a good education program. The most successful special education teachers think of the total development of the child.

Dr. Wishik—In your term "total development," I am sure you include the child's personality. We all recognize that every handicapped child has special psychological problems and emotional difficulties over and beyond those which would otherwise occur in the usual process of the child's development.

Dr. Mackie—I would certainly agree that every handicapped child has occasion for difficulty. Would you think it might be possible for the situation to be so well handled that no significant emotional problem would result?

Dr. Wishik—Well, perhaps that is just a matter of words. We could think of the child who has been well handled as having been helped to adjust to his problem rather than never having had one. The adjustment may have been an easy and a quick one and have left no scar. From the point of view of developing services to meet the needs of handicapped children, I suppose we agree that, by and large, these children are faced with a problem to which we should pay special attention.

Dr. Mackie—At this point I should like to describe one or two trends in special education which are directed toward this very problem. One is the emphasis upon classes for physically handicapped children under age 6. These classes afford a setting for a preventive program which may have far reaching results. This is especially important in the care of the child with cerebral palsy or for a child with a serious hearing loss. A few state laws make it possible for local school districts to receive state aid for the education of certain types of physically handicapped children as young as age 3. These classes for young children, when under the jurisdiction of the public schools, must be staffed by qualified personnel. One of the emphases of the cerebral palsy program in California is in this young group.

New York City's public school for the deaf accepts children as young as 2½ years of age and it gives service to parents of infants suspected of being deaf. One of the features of this school is its program for parents of children in all age groups. Through discussion groups centered in the school, the parents get help from teachers, physicians, nurses, mental hygiene experts, and from each other. Values other than the mere acquisition of facts grow out of parent participation. Fathers and mothers tend to change their attitudes, to lose their fear and feeling of frustration as they come to believe that there is something which they as parents can do to help their children toward good adjustment.

On the other hand, one of the weakest parts of the program for the handicapped, is in the adult and youth group.

Too often we have provided special education for the elementary school child and left the youth or the adolescent to make whatever adjustment he can right at the time when he is thinking of his vocational placement and when social success is so important to him.

Dr. Wishik—And too often we fail to realize the effect upon an adolescent when he has a limp, or a cosmetic defect or when he must wear a brace. The psychological problems of this group are many—but for lack of time I should like to concentrate at this point on the question of vocational planning and guidance for the handicapped child. Not only do we often fail to plan for his future vocation, but even within the school itself there is frequently lack of consistent relation between the child's health condition and his curriculum. I know of one situation in which a child had passed through a school health service, had been seen by a consultant ophthalmologist within that service, and had been labeled as a child with a severe visual handicap. Nevertheless, within that same school the child was placed in vocational activities which required the use of a micrometer. This illustration points dramatically to the need for bringing the health service into the picture when the child is choosing his courses. Even when we recognize the importance of vocational guidance, we usually do so when the child is actually seeking employment at the time of leaving school. It seems necessary for us to go back to the younger age group, perhaps, if we can, even into the elementary grades and at that point try to make an evaluation of vocational possibilities for the child in the light of his known handicap.

Dr. Mackie—We must consider the child's abilities and in the light of them learn to what degree his handicap restricts him from pursuing his normal interests. At the time the child is about ready to enter junior high school a closer working relationship between health services, vocational rehabilitation, and education would contribute to a wiser choice of school and of school subjects and would undoubtedly lead to better vocational adjustment.

Dr. Wishik—I should like to see established in schools where there are handicapped children, and this means all schools, some special vehicle, such as a conference for the specific purpose of vocational planning for handicapped children. Each child who is known to be handicapped should be considered periodically at such a conference. Attending the conferences might be representatives from the health service, preferably including a physician who is a specialist in the field appropriate to the child's handicap, an educator, a vocational rehabilitation agent, other vocational counselors, a medical-social worker, and possibly the parents. The adolescent child should take an active role in the planning.

The conferences could be organized into groups in different ways, for one, on the basis of medical diagnoses, so that a specialist such as an ophthalmologist or orthopedist could give consideration to a number of children at each session.

Dr. Mackie—While it may seem a little time consuming to do this, undoubtedly many hours of professional service would eventually be saved. A conference directed toward vocational adjustment is only one example of the importance of coördination of services all through the program.

We cannot take the child apart and treat him in sections. We cannot treat a muscle or educate a brain and have as an end product a well adjusted individual. It is only through the intermeshing of medical services, education, guidance, and parent effort, together with the direction of the individual himself that a well adjusted person can be expected.

Gathering and Evaluating Accident Data with Respect to Farm People and Farm Workers*

THOMAS C. M. ROBINSON

Agricultural Statistician, Bureau of Agricultural Economics, U. S. Dept. of Agriculture, Washington, D. C.

MOST agricultural establishments are very small, keep no records of accidents, and are not required by law to report accidents to any governmental organization. Complete enumerations are expensive, so sample surveys are ordinarily resorted to. Mail surveys appear impractical because of the unmeasurable selectivity of response; a farm operator who has himself experienced, or one of whose family or hired workers has experienced, a disabling or expensive accident during the reporting period is much more likely to return a questionnaire than is a farmer whose family members and work force have escaped serious injury during the reporting period. Therefore, accident information has been obtained by interviewing the operators of a representative sample of farms throughout the United States.

The sampling methods used were a combination of area and list sampling. Because of the importance of very large farms and ranches in the Mountain and Pacific states as employers of labor and producers of livestock and crops, it was decided to sample large farms at a considerably heavier rate than other farms. A list of farms which were considered to be large on the basis of total areage, acres harvested, number of cattle, number of sheep, or value of products sold was obtained from the Bureau of the Census and used as I shall describe later.

The 3,000-odd counties of the United States were grouped on the basis of type of farming area into 400 strata having approximately equal numbers of farms. An individual stratum did not extend across state lines except in the Mountain states, where state lines were disregarded. In the process of stratification, the larger sub-type of farming areas were divided into contiguous groups of counties, whereas some of the smaller sub-type of farming areas had to be combined to form a stratum. From within each stratum two counties were selected at random. Within the sample counties small segments containing an average of five farms were delineated on highway maps. So far as possible natural boundaries, such as roads or streams, were followed in outlining the segments to make identification easy.

The interviewers used were local people with farm backgrounds. Each interviewer was ordinarily responsible for two counties. He or she was instructed to interview the operators of all farms on the large-farm list within the two counties and those of all farms with headquarters located inside the sample segments. To make sure that no farms were overlooked, the interviewer was required to sketch the outlines of all

* Digest of a paper presented at a Joint Session of the Public Health Education and Statistics Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 12, 1948.

farms or non-farm tracts of land either on an aerial photograph of the segment or a separate sheet of paper. To make sure that personal judgment would play as small a part as possible in the decision as to whether or not a given farm was to be included in the sample (i.e., whether or not its headquarters was located within the segment), a rigid scheme for determining what point should be considered the farm headquarters was prescribed. In case the farm operator lived on his farm, his residence was considered to be the farm headquarters. If he did not live on the farm, but there was a residence on the farm, that residence, or in the case of more than one residence, the most valuable residence, was to be considered the farm headquarters. If there was no residence on the farm, then the only, or most valuable building, was considered to be the headquarters. If there were no buildings, the main entrance to the farm was considered to be the headquarters. In the absence of a main entrance, the northwest corner of the farm, defined as the westernmost point on the northernmost border, was considered to be the headquarters. This scheme covers every possible situation. To make sure that it is followed, a Farm Identification Sheet is used on which each farm or tract of non-farm land located within the segment is listed on a separate line and identified by a number corresponding to the number given that farm or tract on the sketch. The designation of the headquarters, and its location inside or outside the segment, is recorded on the Farm Identification Sheet, together with a notation for each farm with headquarters within the segment showing whether or not a schedule was obtained. If no schedule could be obtained because the operator was not at home, a check-sheet containing enough information to give some idea of the nature and size of the operations was prepared on the basis of conversation with neighbors or other informed persons. This check-sheet information was of some help in expanding the schedule information into absolute estimates.

The face sheet of the schedule was used primarily for recording information to identify the farm. The accident section itself consisted of a battery of 14 questions, only the first 3 of which were to be asked on every farm irrespective of the answers obtained. These 3 questions were designed to identify farms whose residents or workers had been involved in lost-time accidents during the reporting period. An answer of "yes" to any one of these questions meant that question 4 had to be asked, while an answer of "no" to all three questions meant that no accident had occurred, so that no further question needed to be asked. Question 4 is what is called an open question in that it asks for a general answer in the farm operator's own words rather than asking for a categorical answer to a specific question. The interviewer is to record in the blank space below the question a brief account of the cause and type of accident and the extent of the injury. An example might be — "Operator's mother slipped on ice on back steps and broke hip. Steps had no handrail." The respondent in the course of his narrative ordinarily answers a good many of the questions 5 through 14. The interviewer records such answers in the appropriate places without asking the questions again, asking only the questions whose answers have not been volunteered in the course of the narrative. In case more than one person was injured, or the same person was injured more than once, the questions from 4 on are asked about each person injured or each accident.

The biggest deficiency of this battery of questions has been that in a fairly large fraction of the cases the underlying cause of the accident, as fatigue, carelessness, error in judgment, struc-

tural defects, etc., cannot be determined. It may be possible to frame a specific question which will obtain this information in the majority of cases. Another technique which has not yet been tried but which we are now considering would be to write a letter to the operator asking him for additional information about the accident and its causes.

Few previous misconceptions have been shattered by the results of the two surveys for which the analysis has been completed. On the other hand, general impressions have been confirmed or modified by these first objective nationwide surveys of non-fatal as well as fatal accidents. I should like to present a few of the findings from the April, 1948, survey, which covered the first four months in 1948.

During that period, over a quarter million people who were living or working on farms were injured seriously enough to lose at least one day's time from their regular activities. The cost of medical, dental, and hospital care exceeded 11 million dollars, and the total time lost was over 6 million days, including no allowance whatsoever for the time lost by persons who were fatally injured or permanently and totally disabled.

Medical, dental, and hospital expenses averaged just over $40 per person injured, or about $52 per person injured if accidents involving no cost are excluded. The average cost per accident was much higher in the Northeast than elsewhere. The average cost of medical care increased with increasing age. There was no significant difference between the average cost of this care to males and to females. Accident and workmen's compensation insurance played a relatively minor role in defraying medical costs. About 17 per cent of the accidents involving known costs were covered by insurance, and the insurance paid 21 per cent of the costs. Coverage was much higher in the north central region than elsewhere, with 31 per cent of the accidents and 34 per cent of the costs covered. In the South only 7 per cent of the accidents and 11 per cent of the costs were covered.

The average amount of time lost per accident was about 22 days, or just over 3 weeks. Differences betwen regions were slight; only in the West was the average amount of time lost per accident significantly different from the United States average. Almost half of the accidents reported resulted in a week or less lost time, while only about 1 out of 7 involved more than a month.

Twice as many farm people were injured in falls as in any other type of accident. Falls on the ice were more numerous than any other type of fall, but falls on stairs, from vehicles, from structures, and from home furniture led to significant numbers of serious injuries. The next most common type of accident involved animals, with horses and mules responsible for half these accidents, and cattle other than bulls for a third of them. Very few accidents involving bulls were reported. Motor vehicles were involved in 1 accident out of every 9, with passenger cars responsible for 70 per cent and trucks for over 25 per cent of that number. Trailers and motorcycles accounted for the rest. Machine accidents were the fourth most common type, amounting to about 10 per cent of the total. Tractors were by far the most dangerous machines during this 4 month period, accounting for 30 per cent of the machine accidents. Among the hand tools, axes were the most productive of serious injuries, accounting for 4 per cent of all accidents, as many as falls on the ice or accidents involving cattle other than bulls, and a half more than tractors. Injuries resulting from the handling of heavy objects, stepping on or striking against sharp objects, and getting in the way of falling trees and lumber also bulked large in the total, amounting in aggre-

gate to 13 per cent of all accidents. Some 10 per cent of all accidents were so incompletely described that classification into any of the 9 major types was impossible.

Over two-thirds of the accidents occurred on the farm, with one-sixth happening in the house, about one-fifth in other buildings on the farm, and 30 per cent elsewhere on the farm. One-ninth were on the road or street, almost one-fifth were elsewhere off the farm, and the location of about 2 per cent of the accidents could not be determined.

More than 40 per cent of all accidents involved farm operators; about 45 per cent happened to members of their families; 7 per cent happened to hired farm workers; and a somewhat smaller percentage involved other persons. During this 4 month period, about 20 operators out of every 1,000 were involved in a lost-time accident. Comparable accident rates were 12 per 1,000 for hired farm workers and 7 per 1,000 for members of operators' families and others. The accident rate for hired workers is probably understated, as non-work accidents of hired workers not living on the farm were incompletely reported. Over two-thirds of the accidents to farm operators and hired workers happened while they were doing farm work, but only about a third of the accidents to family members were associated with farm work. Almost a third of the accidents that involved members of operators' families were recreational accidents.

About 49 per cent of all accidents were the result of farm work, 18 per cent of the total occurring while the injured was doing chores, and 31 per cent while he or she was engaged in other farm work. Only 5 per cent of the accidents were associated with housework, while 16 per cent happened in the course of recreational activities and 30 per cent while the injured person was engaged in some other or unspecified activity.

More accidents occurred in April than in any of the three earlier months, primarily as a result of greater farm work activity. Accidents occurring while the injured person was doing farm work other than chores increased 50 per cent in number from March to April. Chore accidents increased even more, due probably to greater haste and fatigue on the part of persons working long hours at other farm work and to a shift of chore work from farm operators and hired farm workers to members of the operator's family who are apparently more likely to have accidents because they are less familiar with the operations involved. Accidents associated with other activities were no more numerous in April than in March. As would be expected, the locations in which accidents increased in number from March to April were in the barn or other buildings and elsewhere on the farm, the two locations in which the bulk of the farm work is done. By types, the increase was distributed among accidents involving hand tools, machines, animals, burns or shock, handling objects, falling objects, and stepping on or striking against objects.

A number of additional inferences have been drawn from the data collected in the April survey. Copies of the preliminary report based on the survey may be obtained from the Bureau of Agricultural Economics.

A good many other types of things could be done with accident data which we have not done with the April survey. We have not computed accident rates in terms of accidents per 100,000 people by sex, age group, or status on farm. We have not computed machine accident rates per 100,000 hours of operation of each type of machine, or per 100,000 of each type of livestock. We have made no attempt to compute the accident rate per 100,000 hours in a given activity, as housework, chores, or other farm work. Given adequate supplementary

information, all of these things could be done.

I have mentioned one type of bias in accident information reported to interviewers, that is, the tendency of the more distant accidents and the relatively minor accidents to be overlooked. Another type of bias arises from the fact that when information for an entire enterprise or household is reported by one individual, he tends to report those accidents which impressed themselves on his consciousness because they happened to him or to someone close to him more nearly completely than other accidents which made little impression on his consciousness because they happened to people in whose welfare he had somewhat less interest. In our surveys to date, for instance, it seems probable that accidents to members of other households on the farm have been less adequately reported than have accidents to members of the operator's household. This particular category of bias could be reduced by interviewing a member of each household on the sample farms. The question is, Would the increase in completeness be worth the cost of the additional interviews?

In addition to such reporting biases, there are other qualifications which one must remember when comparing accident rates in different industries or of different sexes or members of a family. For instance, if one day's lost time from the regular activity of the injured person is the minimum criterion for a reportable accident, an injury to a housewife and mother will probably have to be much more serious to be reported than one to a factory worker, because the homemaker feels forced by circumstances to carry on her regular activities despite considerable disability, whereas the factory worker may be encouraged to take time off until the disability ends. Somewhat the same considerations may force the farm operator to stick on the job at reduced efficiency, particularly if he has no hired help and no family members in a position to be helpful. Even within a single industry, differing policies in different individual establishments may result in non-comparable accident statistics, for at one establishment a workman with a given injury may be sent home from work while in another establishment he may merely be shifted to another operation where his injury will not interfere so much.

Without intending in any way to undersell accident statistics, I must admit that all of these qualifications make it imperative that the would-be user of such statistics have a thorough understanding of the definitions, personnel policies, economic and sociological situations, sampling methods (if any), and methods of collection involved. In short, as in any other statistical field, accident statistics cannot be accepted uncritically. The mere fact that a statistic appears to be definite because it is quantitative does not mean that it is a simple representation of fact.

Development of an Educational Program on Sanitation in a Typical Food Industry—The Baking Industry*

EDWARD L. HOLMES, PH.D.

Director, Sanitation Department, American Institute of Baking, Chicago, Ill.

THERE is no need, in speaking before a group of this character, of discussing a detailed historical development of modern concept of sanitation. However, when we come to think of sanitation as it now applies to the food processing industry, we must recognize that with the passage of the Federal Food, Drug and Cosmetic Act of 1938, there began a wide extension of previous concepts. This extension goes into the realm of the esthetic as distinguished from purely public health requirements. By this is meant that modern-day sanitation, as it applies to food producing establishments is also concerned with the prevention of the inclusion of abhorrent materials such as the debris from insect life and rodent life, that is not necessarily connected with disease. For example, in modern-day flour handling practices, it is necessary to provide means for eliminating the common conveyor and elevator infestation with flour beetles and similar organisms so as to prevent their being macerated and the body fragments distributed throughout the cereal products manufactured with the flour.

Maintenance of good bakery sanitation is not only the vital and essential public health operation that it is in other food industries, but it is also a definite public relations operation. There is no question but what the general public would find abhorrent any product manufactured by an industry which admittedly permitted the inclusion of large numbers of insects or their body fragments into their finished products.

When the development of an adequate sanitation educational program in the baking industry was inaugurated in December, 1945, it was with the recognition that not only must the public health features of sanitation as applicable to bakeries be brought to the attention of the industry but also that a better appreciation of this public relations factor should also be brought before them.

Consideration was given as to which agency within the baking industry might undertake this program. Some twenty-five years ago, there was founded the endowed institution known as the American Institute of Baking. This institution was set up primarily for the purpose of conducting purely educational programs and undertaking purely scientific investigations for the betterment of the industry in general. It therefore appeared natural that the Institute should be the medium for disseminating information in this field. Experience gained since, has justified this decision for it has been possible to organize a Sanitation Department at the Institute which could devote full-time to this problem alone.

* Presented at a Joint Session of the Food and Nutrition, Health Officers, Laboratory, and Engineering Sections of the American Public Health Association at the Seventy-Sixth Annual Meeting in Boston, Mass., November 11, 1948.

ORGANIZATION OF THE BAKING INDUSTRY SANITATION PROGRAM

In thinking of the problem of getting an educational program started in a food industry, some thought must be given to the make-up of the industry—economically and socially. The baking industry is a very interesting one, for it varies from large nation-wide organizations operated like other impersonal corporations to the small neighborhood bakery operated by a single family, much of whose stock in trade is the personal relationships between the customer and the owner-operator family.

Briefly, the baking industry consists of wholesale bakers, multiple retail bakers, and local retail bakers. The wholesale bakers in turn are divided into wholesale bread, wholesale cake, wholesale pie, and wholesale specialty bakers of many kinds. The multiple retail bakers usually manufacture all of these lines, as do many of the wholesalers. The retail bakers usually manufacture all of the lines, but the emphasis at the retail level, including the multiple retailer, is upon cakes and sweet goods rather than upon bread. Due respect must be given to the small baker of bread, but there is no question but what the major quantities of bread consumed in this country are manufactured by large wholesale bakeries. The largest concern in the baking industry has well over a hundred large establishments, some so large that a number of individual units do a gross business of several millions per year.

It was decided first that an educational program should be undertaken to disseminate information already available from the operation of the Federal Food, Drug and Cosmetic Act under the Food and Drug Administration. At this time it was recognized that there are four levels of individuals working within the baking industry which must be reached by this educational program. These are:

1. Management—Ownership
2. Key Technical Men (either General Managers or Production Managers or Sanitation Directors)
3. Individual Production Employees
4. The Janitorial or Sanitorial Staff (those engaged in actual cleaning of the bakery)

The most important of these four segments is undoubtedly the first, or owner-management, for these people within the industry must be convinced of the value and wisdom of a sanitation program in order to obtain adequate funds and an adequate personnel organization within the different concerns to carry out any program at all. Most of the difficulties in the establishment of a sanitation program within the baking industry have resulted from a failure to convince this level of the wisdom of expending the necessary funds. Regardless of how drastic such actions may have seemed, the activities of the Food and Drug Administration in enforcing the federal law have had a salutary result in convincing a large segment of industry management of the value of sanitation. This group will recognize without going into too great detail the long existent controversy or difference of opinion between regulatory officials regarding the advisability

(1) of using educational methods only and (2) of using regulatory action only on the part of a law enforcing agency.

It is our conviction in the industry that there is a positive need for direct firm action on the part of regulatory officials in enforcing sanitary requirements against that segment of industry that is loath to devote adequate funds to the development of better conditions within their plants. Let us grant that government educational programs are needed, but we have seen many instances in which strict regulation is necessary. Just recently, in a large city, several instances were seen where, at the behest of the city health department, bakers had purchased the newest modern

design of machinery, so designed that it could be cleaned readily and, in fact, get soiled only to a minimum degree by production operations. However, these machines were being installed in plants that were literally filthy. No attempt at regulatory action had ever been made, for it was felt that, because these firms were willing to purchase new and modern designed machinery, they were so progressive, that regulatory action against them would be harmful. It is our conviction, viewing from an overall industry betterment angle, however, that such firms are more inclined to purchase new machinery for the economic advantages than for the advantages of better sanitation. We do not advocate repressive measures on the part of regulatory agencies, but we do believe that alertness and prompt court action in the case of unwillingness to be truly sanitary, is an essential feature of government health programs. Such action can never, of course, be taken by bakers' associations or advisory groups. It has to originate from governmental agencies. We sincerely hope that any representative present from such agencies will carry back with him the thought that industry as a whole is not unsympathetic to their activities. The industry wishes to see sanitary codes enforced fairly and honestly, but thoroughly, where needed.

A large number of articles have been written by the American Institute of Baking on the fundamentals of sanitation and published in trade journals getting primarily into the hands of bakery management. Wherever possible, we have had speakers before bakery management conventions. Sad to say, we feel we have not been too successful. One of the best illustrations of this is the remark made by a prominent bakery executive when told that a representative of our Institute would speak on bakery sanitation at a forthcoming convention: "If those fellows don't stop coming down South here from Chicago to talk to us about that damn subject, we all might as well give up our business. Pretty soon, our consumers will learn all about it and then they won't buy any of our product." We are trying our best to combat this ostrich-like feeling, for we are convinced that the public relations value of a thoroughly sanitary industry are much more on the positive side than the negative.

SANITATION SCHOOLS OR COURSES

Second, after our first efforts had been under way some ten months, we found that there was a widespread need in the baking industry particularly, for the spread of detailed information regarding plant sanitation methods. Our answer to this need has been the establishment of special schools or short courses. Owing to the diverse make-up of the baking industry, it has not been possible to bring large numbers of people from different sections of the country into Chicago. Attendance at a school, even of a few days' duration, means that the men attending must be away from their shop production, and the more time that can be saved for them the better. We therefore have established a system of giving regional schools or short courses throughout the country. To date, twelve have been given or planned through 1948. The last was given in Boston in September. These courses undertake not to give the final word, but to give the details of the problem with as many of the answers as can be given in the few days available, so that personnel attending the course will be able to take back to their plants at least a proper appreciation or evaluation of the different factors of what they are up against, and have some guide as to further study of more details.

Subjects covered in the order of their importance are:

1. Those subjects relating to the management of production operations, and building and plant maintenance, which will eliminate the

causes of rodent and insect infestation and bacterial contamination of the finished products.

2. Then, with a recognition that no matter how careful we may be, there will always be a casual rodent or insect invasion of even the best of plants, measures are discussed which will enable the baker to set up permanent safeguards against such casual invasion, together with the methods needed for ridding the bakery of any infestation that might develop regardless of measures adopted to prevent it.
3. The subjects include also such special features as what we term "preventive fumigation," "organization of janitorial service," "training in personal hygiene practices among bakery employees," "the biology and life history of rodents and insects," "fundamental bacteriology," and the like; but emphasis is laid upon practical application.

It has been our experience that in bringing together trade groups for short courses, the greatest possible emphasis must be placed upon visual education methods. We have, therefore, gone to great lengths and expense to prepare working models of bakery equipment. Wherever this has not been possible, we attempt to show graphically on charts just what is involved. The old pedagogical method of the professor standing in front of the audience and more or less reading to his students is definitely taboo in any bakers' school.

Obviously, our presentation has improved from course to course. We started out at first by bringing in representatives from all sorts of industries and public health organizations to discuss how they cope with the problem. However, we have now found that it is more effective if the subject matter is kept down to the details of interest to a baker, with as many practical applications as possible. Therefore, for the future we are planning our courses with a "faculty" of five only, all but one being on the Institute's permanent staff.

The type of individuals that have been attending these courses includes the production manager, the sanitarian, or chief of maintenance of the baking plants. These men carry the message back to their owners and general managers, but we find that sometimes they are faced with the problem of not being permitted to go ahead with what they have learned because top management has not been convinced of the economic advantages. Again, as was said, before, we are convinced that our primary problem is to convince top management of the need of spending money for better plant sanitation.

The third level for an industry educational program involves the individual employees engaged in production. This level in our opinion is the second most difficult one to reach. However, it is a very important one. A concrete example of why this is so was observed recently. The vertical mixing machines used by many cake bakeries have three speeds. In using these, it is possible for the operator to press a button and turn on the machine at the maximum speed of 120 r.p.m. at the start of operations, or in turn, he can start the machine by pressing one of three buttons which sets it in motion at 60 r.p.m., then pressing a second raising it to 90, and a third finally to 120, as the mixture being worked upon begins to become more homogeneous in character. In a great many bakeries, an observer watching this process in action will notice that when the operator turns on the high speed immediately, there is considerable loss by splashing, which not only loses dough, but renders the immediate vicinity of the machine very dirty. Proper training of employees in their sanitation responsibilities would take cognizance of this type of procedure and teach them the reasons for proceeding gently, not only from the production standpoint, but also from the sanitation standpoint. In other words, effort must be made to train industry employees in a food establishment in the proper operation of their machines for each individual job, so that they will contribute

at a minimum to the general insanitary picture.

It is difficult to set up a procedure for meeting this type of need. Our own program at the present time is devoted solely to the issuance of posters, in which each particular job is analyzed and the sanitation features of proper procedure are brought to the attention of the employee. In addition, it is planned to encourage the holding of individual plant or company schools for the purpose of discussing these factors and setting up better appreciation of individual jobs on the part of that concern's own employees. However, this is essentially meeting the problem at the company level rather than the industry level.

Before passing on, however, it might be well again to consider further the subject of sanitation posters. It is our conviction as a result of our experience that posters are best devised when they will appeal to the individual employee on an emotional basis, in that it will tie in with a recognition of his job as an important one. To meet this requirement, we have devised posters which always carry a picture of a baker doing something. The figure on the poster is garbed in traditional baker's costume. We have found, that our little "Joe Doakes the Baker" figure carries an emotional value comparable to the well known comic strip figures. To add to this appeal, each poster is given a descriptive title, such as "Give Bugs the Brush-Off," "Store Flour Safely," "Make a Clean Sweep," "Keep 'Em Dying," "Signs of Danger." The attempt is made to keep these on a commonplace conversational basis so that they will attract attention, so that when seen across the room, the employee will be inclined to read the poster. We also try to key up the individual posters with characteristic seasonal operations, such as the statement "It's Weevil Time," or "Rout the Rodents," so that when they see a new poster, they may be inclined to inquire, "Well, what does that have to do with the other ones?" Color schemes are very valuable and, last but not least, an attempt is made to tie in the concept of sanitation as meaning better business and the implication of a better remuneration and consequent security to the individual as a result of paying attention to these sanitation suggestions. Our posters have emphasized the points of inspection of ingredients and applicable methods for residual and contact sprays in insect control. We have also issued posters that outline the salient points in trapping for rodents, in looking for the signs of rodents, the things to look for when mice leave evidences of their presence, and the typical rodent harborages that employees know about, so that they will eliminate them whenever possible on their individual responsibility.

The fourth level of education involves the training of the porter, janitor, or sanitary staff of the individual plants in details of their work and efficiency of operation. These men must be taught how to do their job properly as a result of proper experimental effort. There have been so many advances in the fields of detergency, and personnel efficiency, that these can be outlined with distinct advantage, to the cleanup staffs of any food plant establishment. The work of getting this information across must undoubtedly be undertaken through the medium of company or plant training courses. As yet, in our program, we have not had an opportunity to develop this type of plant training course, but we are contemplating doing so shortly. There is a wealth of material available upon which such courses can be based. In fact, there is no doubt but that many present in this group are familiar with it. The point to be made at this juncture, however, is that the baking industry itself does not know it. It is up to industry sanitation advisers to bring such material to the attention of indus-

try. This is a primary function of an educational program in this field.

COÖPERATION AMONG FOOD INDUSTRIES IN CARRYING OUT SANITATION EDUCATION

Early in our program, it was recognized that other industries had also had a wealth of experience in the field of industry-wide sanitation education. With simultaneous recognition on the part of many of these industries, there was formed a group now known as the National Committee of Food Sanitarians, with headquarters in Chicago, consisting in membership of industry sanitation advisers only. This group now numbers approximately thirty industries, with one or more men from each industry, as active members of the committee. Information and organization of sanitation programs are pooled among the members so that, for the betterment of all in disseminating correlated advice, there will be a sound food industry advance in sanitation rather than a sporadic advance in leaps and bounds by individual industries. By this is not meant that there is any force applied as to how any one industry should conduct its own program. All information pooled is purely voluntary. Such a pooling of the education program is vital, for it has been found that the voice of many, speaks with much more authority than the voice of a few. For example, recently, conclusive evidence was developed that the practical use of the rodenticide "1080" in food plant establishments was developing in the wrong direction. In our own baking industry, "1080" was found to be distributed almost indiscriminately in bakeries with cups of this violent poison in solution form placed directly upon flour sacks, on overhead beams where it could fall into the finished products, and with a multitude of other misuses. As a result of concerted effort, it has been possible to interest government authorities in the inauguration of a fundamental research program for the development of newer and safer rodenticides than "1080." Previous interests on the part of the government have only been to examine carefully all poisons proposed. Each company engaged in the manufacture of chemicals that might develop into rodenticides was constantly proposing newer and better rodenticides, primarily from the interest of finding new uses for chemicals already manufactured by them. The feeling of this group of nation-wide food industry sanitarians has been that there is real need for government to undertake to do fundamental research to locate and find safe, as well as adequate, rodenticides which could take the place of "1080."

IN-PLANT TRAINING OR EXTENSION SERVICE IN SANITATION EDUCATION IN THE BAKING INDUSTRY

In recent months, it was found that there is a widespread need for detailed training in methods of inspection as well as in remedial methods in the baking plants, with regard to sanitation problems.

For this reason, the American Institute of Baking, as part of its education program, has now set up a bakery inspection training service. Experienced government inspectors have been engaged on a full-time basis as permanent employees of the Institute, totalling at the present time, between 40 and 50 years of government enforcement experience, ranging from that of ordinary inspectors to that of an administrative official. Thorough inspections are made of any plant applying for this service on a cost basis, the plant being charged a per diem rate, figured to cover all overhead, and the cost of subsistence and travel. The initial inspection of from 2 to 5 days covers the plant with a thoroughness of detail never previously experienced even when covered by the same inspectors engaged in government service. An analysis is made of what-

ever sanitation program the plant has previously installed; the plant is rated numerically as to its relative sanitation level and a program recommended for bringing the plant up to whatever higher level management desires, this level being in all cases equal to or higher than that of mere compliance with the Food, Drug and Cosmetic Act requirements of freedom from filth-contaminating influences.

Following this initial inspection, a series of three or four inspections are made throughout the year in order to evaluate the extent of progress in raising the plant's level of sanitation.

The response of the baking industry to the offer of this service has been most appreciative. For the first three months of its existence, only one inspector was employed, but before the end of this period, it was evident that it was necessary to have at least two more, and it is anticipated that in years to come, we will possibly double or treble the amount of service we are now offering.

SUMMARY

In closing, it might be well to summarize briefly our concept of what we have found to be an adequate industry program.

First, it must reach each of the four basic levels of the various diverse types of firms of the industry. The two most important of these being:

1. Management, who must be convinced of the necessity of providing funds.
2. The individual employees of the industry who must be trained in the performance of their production functions with a minimum of development of insanitary conditions.

Second, experience has shown that the pooling of experience and general information with other poor industries has proved a tremendous asset.

Finally, it is necessary also to establish a direct industry contact for the purpose of developing fundamental knowledge of the problems of sanitation incident to one's own individual industry.

Rhode Island Cash Sickness Compensation Program*

THOMAS H. BRIDE

Chairman, Rhode Island Unemployment Compensation Board, Providence, R. I.

IN other countries, even in the early days of social legislation, temporary disability insurance programs preceded other types of social insurance. This has not been so in the United States but there is little doubt but what it would have been so had it not been for the extensiveness of unemployment which provided the impetus for the passage of the Social Security Act in 1935. Even at that, it is difficult to understand why this Act did not make any provision for the protection of workers who become unemployed through sickness or disability, as it did for those who become unemployed due to economic factors.

In 1942, Rhode Island undertook the passage of the first piece of legislation in the United States to provide a form of disability insurance, protecting those workers whose unemployment was caused by sickness. This legislation is known as the Rhode Island Cash Sickness Compensation Act.

As you well know, we have had in Rhode Island and in other states, disability insurance in the form of Workmen's Compensation programs which among other things protected workers against unemployment due to accident or occupational diseases. In addition, in Rhode Island and in other states, since 1936, we have had unemployment insurance programs which protected workers in part against unemployment wage losses due to economic factors. Between these two, there remained a gap which has been closed in part by the Rhode Island Cash Sickness program, providing further protection to groups of workers not included in either or both of the other programs, but who too suffer wage losses through unemployment caused by illnesses other than occupational diseases or accident.

The Cash Sickness program was set up so that there would be no exclusion because of age or because of the type of disability. Every worker employed by a firm which is subject to the Rhode Island Unemployment Compensation Act is automatically covered by the Cash Sickness Act, unless, and this is the only exception, he prefers to be exempted because of a religious affiliation which depends for healing upon prayer or other spiritual means. It might be interesting to note that up to the present time we have affidavits from some 39 persons who have claimed this type of exemption.

There were many factors other than the consciousness of the need and the logic of the situation which had a very direct influence on the adoption of this Cash Sickness program in Rhode Island. Among these are included the existence of the Unemployment Compensation program and the very substantial size of the Unemployment Compensation Trust Fund at the time; the requirement in the Rhode Island Act of an employee tax in addition to an employer tax; and the concerted efforts

* Presented before a Joint Session of the Industrial Hygiene and Medical Care Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

on the part of interested groups to effect a merit rating or employer tax reduction on the one hand, and the liberalization of the benefit structure or an employee tax reduction on the other hand.

From this, evolved the decision to establish this Cash Sickness program and to finance it by diverting 1 per cent of the employee tax from Unemployment Compensation to a Cash Sickness Fund which would be used for the payment of benefits under the Cash Sickness program. At no time has there ever been any employer tax used to finance the Cash Sickness program, and as a matter of fact, there has never been any real effort to have such a tax included.

It is not too difficult, therefore, to appreciate why the Cash Sickness Act provided that this program would be administered by the same agency which was administering the Unemployment Compensation program, namely, the Unemployment Compensation Board. In addition to this matter of being administered by the one agency, there is much more which these two programs have in common. There are very certain and definite advantages which result from the extent to which these programs are coördinated. At the same time, it should be recognized that they are not exactly identical and in a few respects at least they require a different approach. In our efforts to realize the advantages which come from close coördination, we have learned in Rhode Island that proper measures must be taken to insure avoiding the disadvantages from a failure to recognize the distinctions which exist in the two programs.

In order to be eligible for Cash Sickness benefits, any claimant must meet certain minimum requirements. In the first instance, of course, he must file his claim and all such claims during the entire claim process are handled by mail. On this claim form is indicated certain information relative to his unemployment, the onset of his illness, and whether or not he is receiving or has filed for Workmen's Compensation. This claim form must be certified by the claimant's attending physician who is required to supply information relative to his diagnosis and the extent to which the illness or disability prevents the claimant from performing his usual or customary work. While physicians are not held to an exact time limit on the duration of the claimant's illness, it is necessary that there be indicated in the first instance the probable number of weeks that the patient might be incapacitated. This, of course, is reviewed by a medical director to insure that there is indicated a reasonable duration of the illness.

Just as is the case with the Unemployment Compensation program, there are certain eligibility requirements in the Cash Sickness program. In the first place, the worker must have earned at least $100 in covered employment during his base period which, in Rhode Island, is the calendar year preceding the benefit year, beginning in April. These earnings of $100 will entitle him to the minimum weekly benefit rate which has been established, namely $6.75. If his earnings during the base period equal or exceed $1,800, he would then be entitled to the maximum weekly benefit amount allowed, namely, $18. Whether he is entitled to some weekly rate between $6.75 and $18 depends entirely on his earnings during the base period mentioned. The number of weeks he will be allowed to draw benefits cannot exceed 20 weeks, and again depends on the amount of credits he has compiled in his base period, divided by his weekly benefit rate.

With employment conditions as they are today, and the increase which has taken place in the average weekly wage since the establishment of these benefit rates, it is not difficult to appreciate that the great majority of claimants are entitled to the maximum weekly benefit.

The average duration of benefit has been approximately 9 weeks.

At the end of the probable duration of benefits which was originally certified, the claimant is disqualified unless there is additional information which indicates that he is still, because of illness, unable to perform his regular or customary work. This information is obtained either from the attending physician or from a physical examination performed by a physician designated by the agency, or as the result of a field visiting program, or perhaps in some selected cases from all three sources. If, on the basis of this information, it is determined that the claim shall be no longer allowed, and the claimant feels aggrieved thereby, he is given every opportunity to pursue an appeal, first to a referee, then to the Unemployment Compensation Board, and from there, in some cases, to a Board of Review. In the last analysis, a further appeal can be prosecuted from there to the courts.

You will observe from the time of the original certification, during the entire process of appeal, and up to the final determination, the certification and the assistance and advice of physicians are factors without which the system could not function.

We might look for a moment into the actual operations of the Cash Sickness program to see the extent to which workers are calling upon the program for help. In the beginning, it should be appreciated that because of its industrial characteristics, Rhode Island would not have been selected as the most desirable testing ground. Besides being densely populated and very highly industrialized, it has a great diversification of industry, with textiles, machinery and tools, and jewelry as its three major industries. There has always been in employment a much larger number of women than in most other states. Women have averaged 40 per cent of the working force and have approached 50 per cent particularly during the war years.

Herein, as is normally expected, lies to a considerable extent the poorer or non-selective risks.

What is equally apparent is that the period 1942–1945 would not have been selected as the most appropriate time to conduct such a test or actually undertake such a program as we did. The demands of the war program brought into industry older workers and women in great numbers. Such movements in and out of the labor market of persons having no genuine attachment to the labor market resulted in abnormal payments consistent with the abnormal conditions.

During this same period, our annual disbursements in the form of payments so greatly exceeded our income that the Fund itself was seriously threatened. At one time, in 1946, but only for a year, it became necessary to increase the employee tax to 1½ per cent, to help offset this heavy drain on the Fund. The critics of the program were quick in their attempts to attribute this financial predicament to the excessive malingering which allegedly was rampant. While admitting that this program, not unlike any other private or public insurance program, has had and will continue to have its worries in combating malingerers and fraudulent claims, I must say that this was by no means a significant cause of our financial ills. Rather, the load stemmed primarily from the authorized payment of benefits to three groups not originally encompassed.

You will recall that the Cash Sickness law originally provided for payments only to those persons suffering a wage loss through illness. However, during the period of financial difficulty, this original concept was extended to permit payment to workers who continued to receive wages or salary during periods of illness and to workers who received Workmen's Compensation. These two

changes, coupled with the more significant authorization to pay benefits in pregnancy cases, resulted in expanding the program considerably beyond its original scope and beyond the original estimated rate of expenditure. This made necessary a corresponding adjustment of the tax base.

But let us get back to the types of claims filed. In general, it can be said that the claim load (exclusive of those groups just mentioned) continuously displays characteristics not unexpected and quite consistent with the general morbidity and industrial pattern throughout the state. Whether it be age, sex, industry, or medical diagnosis, sample studies show the expected relationships.

Of course, again you must bear in mind that payment in pregnancy cases tends to distort greatly what would be normal findings. For example, in the distribution according to age there was the highest concentration of claims in the 20–29 age group. Thirty-one per cent of all claims were found in this group. Yet, if our system excluded payments in pregnancy cases, the size of this group would revert to normal since approximately one-half of all claims in this age bracket were for pregnancy.

A recent sample study produced additional interesting data. The ratio of claims of industrial workers to the total claim load bore a close relationship to the ratio of industrial workers to the total working force. This same characteristic kept reappearing in other groupings, such as age, sex, marital status, and industry or business.

It was further revealed that 65 per cent of all claims analyzed fell into four major categories of illness: 22 per cent were for pregnancy; 18 per cent for injuries or the ill effects of poisoning; 14 per cent for diseases of the digestive system; and 11 per cent for diseases of the circulatory system. The remaining 35 per cent were distributed among eleven other types of illnesses, with 7 per cent shown as suffering from diseases of the nervous system and sense organs, including mental disorders.

Again, of the claims analyzed, 57 per cent were filed by females. Of that 57 per cent, four-fifths were married. The average age of all claimants was 39 years, with the 45 year average for males 10 years higher than that for females. Only 20 per cent of the male claimants in the group were under 30, while nearly one-half or 49 per cent of the females fell into that age group, again due to pregnancy cases.

The number of cases analyzed was necessarily small, yet it has been sufficient to provide some interesting data, and it is felt that larger cross-section studies will not do great damage to the ratios and characteristics mentioned above. In any event, this analysis might serve to focus your minds on the extent to which the morbidity data accumulated offer a challenge of enormous importance to public health activities, especially to those concerned with prevention, rehabilitation, and the general subject of geriatrics.

We might further ask ourselves what happens to the person in the older age group who is disabled and who has exhausted his disability insurance benefits? Or, if you will, what of that same person who may not be covered by the program? What of the high percentage of claims during pregnancy? And what of the pregnant wives of men who contribute to this system of disability insurance but who themselves (the wives) are not covered by the program? To what extent is our program improving or can it improve the health of workers? To what extent are its benefits being used as financial relief to low income families from the added burden of medical expenses. These are certainly matters for conjecture and study, since this whole program of social insurance, particularly disability insurance, is one of local and national importance.

In studying this program, we should not lightly skip over other significant factors. Should temporary disability insurance of this type be coupled with a maternity benefit program? Should it be extended to cover a program of medical care? Is it logical to extend payments to persons who suffer no wage loss or who may be receiving other compensation such as Workmen's Compensation?

Let us not forget either the vital part played by the medical profession in the administration of this program. Its very backbone is medical certification, advice, and counsel. It is a real challenge to the individual practitioner, as a professional man maintaining his role of assistance to the individual, while at the same time assuming his responsibility to society. On the determination of whether he can or will fulfil this dual role rests the future of such a program.

While the Cash Sickness program in Rhode Island is out of the early experimental stage, having been in operation for 6 years, it is hoped that it will never be out of the research stage. There is a constant effort to improve the plan and to improve the system and administrative structure through which it is carried out. Since its original passage, many changes have been made and no doubt more are contemplated.

In any event, Rhode Island has provided experience for other states adopting this type of social legislation or considering its adoption in the near future. California and New Jersey already have systems in operation. Ohio, Washington, New York, Illinois, and others are investigating its possibilities. From the fact that so many representatives of these states have come to Rhode Island to observe the organization and administration of disability insurance, there is evidence that our experience with the plan is considered worthy of study. As always in a pioneer endeavor, errors have been made. And again, as always in a pioneer endeavor, we regret that some other state was not first to provide Rhode Island with its experience so that we might have profited by its trials and errors. However, Rhode Island workers have been given a measure of protection during illness at a time when it is most needed, and social legislation thereby is moving another step forward.

1949 Ricketts Award

Dr. Ludwig Hektoen, Professor Emeritus of Pathology, and Dr. Russell M. Wilder, formerly Chairman of the Department of Medicine, University of Chicago, received the 1949 Howard Taylor Ricketts Award. The awards and medals were presented on May 23, 1949, at exercises held at the University of Chicago Clinics. At this time Dr. Wilder who is now head of the Department of Medicine, Mayo Foundation, delivered an address entitled "The Rickettsial Diseases: Discovery and Conquest."

Dr. Ricketts in whose honor the award is made, first established the presence of specific organisms as the causative agents of the group of diseases now known as the rickettsial diseases—Rocky Mountain spotted fever, rickettsial pox, and others.

Tuberculosis in a School for Mental Defectives*

ROBERT E. PLUNKETT, M.D., JULIUS KATZ, M.D., AND MARY E. THOMPSON

Division of Tuberculosis Control, State Department of Health, Albany, N. Y.

AND

ROSE R. DONK, M.D.

Newark State School, Newark, N. Y.

THIS paper is a report of the results of a tuberculosis control program in the Newark State School for mental defectives, during the twelve years from 1936 to 1948.

This school, located at Newark, N. Y., is one of the 27 institutions of the New York State Department of Mental Hygiene. It has a population of about 2,700 patients, all mentally defective, about 40 per cent classified as morons, 45 per cent as imbeciles, and 15 per cent as idiots. Most of the patients remain in the school for prolonged periods of time and have limited contact with the outside, though some have occasional short vacations at home. Because the patients live in such close contact with each other, it is assumed that one open case of tuberculosis can spread the infection to most of the inmates living in the same ward. Whatever contact exists among patients in different wards is comparatively casual and is due to work in the kitchen, laundry, or elsewhere. It is obvious that coöperation of many of the patients in observance of even the simplest sanitary measures is at best limited.

The buildings of the institution are divided into two main groups, with 13 wards in each—one group for about 1,400 female patients and the other for approximately 1,300 male patients.

METHOD OF STUDY

The method of the study has been as follows:

1. All patients in residence in February, 1936, were tuberculin tested and the reactors x-rayed. Three doses each of O.T. and PPD were used.

2. In April, 1937, all previously negative reactors and new admissions since February, 1936, were tested with an intermediate dose of 0.00025 mg. PPD and all patients who reacted then or had reacted in February, 1936, were x-rayed. After April, 1937, all admissions and previously negative reactors were tested every 6 months and those giving a positive reaction for the first time were x-rayed. Because the use of two PPD tests was considered impractical, and in order to avoid an excessive number of strong reactions with a single second strength dose, the "intermediate" dose of 0.00025 mg. was used throughout the study after February, 1936, both for the initial tests and the retests.

3. Subsequent to April, 1937, all reactors were x-rayed each year, the males in April, and the females in October.

4. Beginning in October, 1938, all new patients were routinely x-rayed on admission. All employees were x-rayed at that time, and routine preëmployment x-ray examination was begun.

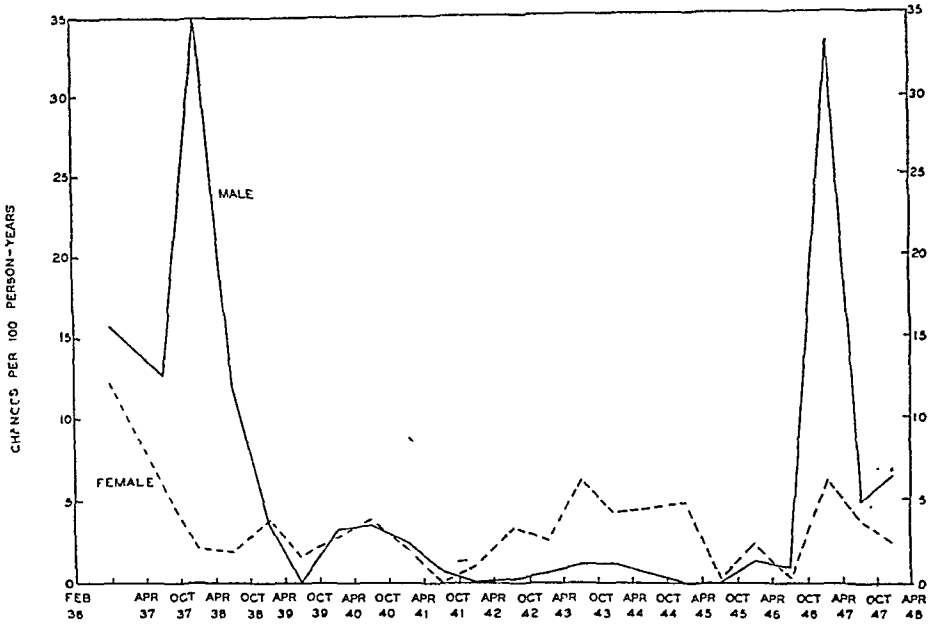
* Presented before the Epidemiology Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

The residence of each inmate, by wards, has been recorded, including any transfers, however brief, from one ward to another, so that the history of exposure to infectious tuberculosis within the wards is known and the patients have been classified accordingly. A patient was considered as having been exposed to infectious tuberculosis if he was in residence for a minimum of one month in a ward in which a clinically significant case of tuberculosis was present. Subsequent to such exposure, the patient was included in the exposed group for the remainder of the study.

Since laboratory data, such as the results of examination of sputum, laryngeal smear, and gastric contents, were unavailable in the vast majority of cases, the diagnosis of tuberculosis was made almost exclusively from x-ray examination on 14" x 17" celluloid films. On the basis of roentgenological characteristics, cases were classified as clinically significant or apparently cured. Due to these limitations, revisions of initial diagnoses have been made in some instances, on the basis of subsequent x-ray evidence. For example, during the course of the study some cases which had been originally classified as having apparently cured tuberculosis were later found to have active disease, while others which had been considered active were reclassified as apparently cured. Some who had been considered as having tuberculosis, were later classified as cases of non-tuberculous pulmonary disease. The difficulties in establishing a definite diagnosis from one or two x-rays alone can be readily appreciated. However, it is felt that after twelve years' experience during which there has been opportunity not only to examine the patients periodically by x-ray, but also to observe them clinically and, in some cases, to have post-mortem confirmation of the diagnoses, the present figures can be considered as reasonably accurate.

The original plan was to isolate all cases of clinically significant tuberculosis as soon as they were detected. During the first few years of the study, however, facilities for isolation of infectious cases were very inadequate, so that segregation of these patients was far from complete. Although there was considerable improvement in this respect beginning in October, 1938, even after that time segregation was not complete, first, because almost invariably there was at least one unisolated case which had developed or reactivated during the interval between examinations, and second, because a considerable lapse of time often occurred between the diagnosis of tuberculosis and the patient's removal to the tuberculosis ward.

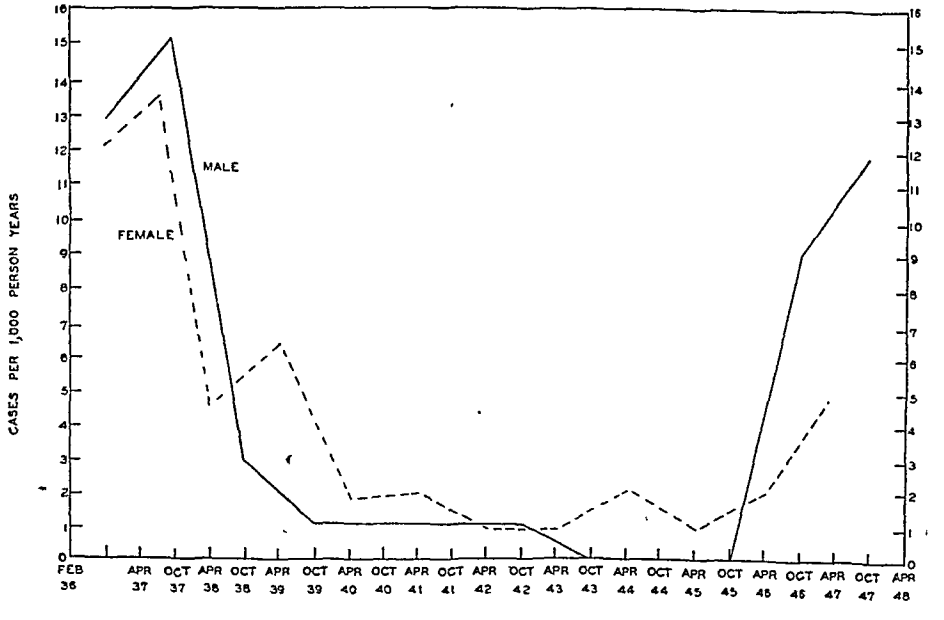
RESULTS



For the purpose of this report, the study may be divided into three periods. The first period was one of comparatively high incidence of infection and disease extending from the beginning of the study in 1936 to 1939. The second period lasted for about 7 years, until late in 1946. During this time opportunities for infection were materially decreased, resulting in correspondingly low levels of tuberculous infection and disease. The third period began in 1946 with the accidental introduction of one case of infectious tuberculosis into one of the buildings in the male division of the school and the consequent marked increase in tuberculin conversions and in cases of tuberculosis among the inmates of that building.

First Period—1936–1939

At the beginning of the study the prevalence of tuberculin reactors was high—52 per cent among males and 71 per cent among females. The prevalence of clinically significant tuberculosis was also high, especially among the females, 3.4 per cent of whom had x-ray evidence of clinically significant tuberculosis.



GRAPH 1

INCIDENCE OF CHANGE FROM NEGATIVE TO POSITIVE TUBERCULIN REACTION AMONG INMATES EXPOSED TO AN INFECTIOUS CASE IN NEWARK STATE SCHOOL

GRAPH 2

INCIDENCE OF CLINICALLY SIGNIFICANT TUBERCULOSIS BETWEEN X-RAY DATES AMONG INMATES EXPOSED TO AN INFECTIOUS CASE IN NEWARK STATE SCHOOL

Among the males the rate was 0.7 per cent.

During the 3½ years following the first survey, that is, during the first period of the study, the incidence of infection was especially high among males exposed to cases of tuberculosis, where the tuberculin conversions reached a peak rate of 35 per 100 person-years between October, 1937, and April, 1938 (Graph 1).* The conversion rates among the non-exposed patients were very much lower, although here, too, peaks were reached for both males and females between October, 1937, and April, 1938.

The incidence of new cases was also high during the entire first period, among both males and females in the exposed group. Among males, the maximum rate of 15.2 per 1,000 person-years was reached in the period April, 1937–April, 1938, while among females, a similar peak rate of 13.5 per 1,000 person-years was reached between April and October, 1937 (Graph 2).*

These high rates are probably due to two factors: first, the number of infectious cases found at the beginning of the study was high, and second, their isolation was not as prompt and complete as would have been desirable. This was particularly true for the female group. As for the male group, there was the additional factor that in the summer of 1937 a new boys' hospital building was opened, resulting in a sudden influx of transfers from other institutions and in the reallocation of old inmates.

Among the patients not known to be exposed to a case of clinically significant tuberculosis, only two cases developed during this first period, both diagnosed in April, 1939, in one ward of the male division.

Second Period—1939–1946

By 1939, when isolation of cases had become more nearly complete, a drop in the incidence of both infection and disease became apparent. Low rates prevailed from 1939 to 1946, so that during these 7 years only 4 new cases developed among the males and 11 among the females in the exposed group, as compared with 12 among the males and 28 among the females during the preceding 3½ year period. The rate of incidence of new cases during this second period (1.1 per 1,000 person-years of observation) was almost 90 per cent lower than the rate during the first period (8.7 per 1,000 person-years). There was a corresponding drop in incidence of change in tuberculin reaction.

Third Period—1946–1948

A sudden change in this situation occurred in the period October, 1946–April, 1947. The tuberculin tests made in April, 1947, showed that, instead of the two or three conversions which were usually found on the semiannual visits, there were 107 male patients who had become reactors since the previous October, the rate of change being 33.2 per 100 person-years in the exposed group as compared with a rate of 1.1 during the preceding 6 month period. X-ray examination of the positive reactors during that same month showed that 9 new cases of clinically significant tuberculosis had developed among males in the exposed group since the previous April, or a rate of 9.0 per 1,000 person-years.

Of the 107 tuberculin conversions, 87 were found in the boys' hospital building, and 8 of the 9 new cases of tuberculosis were found in that building. Investigation of this unusual development revealed that one patient, who had been removed from the tuberculosis ward in 1945 and transferred to one of the three wards in the boys' hospital building because he was considered to have appar-

* Tabulations of data used in the graphs and of other data to which references are made in the text have been omitted from publication to conserve space.

ently cured tuberculosis, had reactivated, and even developed positive sputum in 1947. Further investigation revealed that this patient had been working in the linen room, attending occupational therapy classes and movies and "helping around the wards" so that he had had ample opportunity to be in contact, not only with his ward-mates, but also with the patients in the other wards of the same building.

As a result of this experience, in April, 1947, all reactors in the boys' hospital were again x-rayed the following October, and 5 new cases of tuberculosis were found among them. The next examination of the entire male group, which was made in April, 1948, revealed the presence of 8 additional new cases, for a total of 13 cases in the male exposed group in the 12 month period April, 1947–April, 1948, or a rate of 11.8 per 1,000 person-years. It is very likely that still more cases will be found when the results of the semiannual survey completed in October, 1948, are known. Altogether, a total of 22 cases had occurred among the male patients in the 2 year period between April, 1946, and April, 1948, and 16 of them had been nonreactors up to October, 1946.

Study of the wards of residence of these 22 male patients revealed that 16, or 75 per cent, were living in the boys' hospital building to which the positive sputum patient mentioned above had been transferred. This building houses approximately 30 per cent of the institution's entire male population. Five of the remaining 6 boys were co-residents in another building with a patient who had been incorrectly classified as having apparently healed tuberculosis. No history of recent contact could be established for the last case.

Between the end of 1946 and April, 1948, 5 new cases of tuberculosis developed among the female patients. Four of these had a history of exposure to cases of clinically significant tuberculosis within 1 year, while in the other case the known exposure was nearly 4 years prior to diagnosis.

The experience of the exposed group is in marked contrast to that of the unexposed, as shown by the fact that subsequent to 1939 only 1 case, diagnosed in 1945, was found in the latter group.

SUMMARY AND CONCLUSIONS

The results of the first 12 years of a tuberculosis control program in an institution for mental defectives are discussed. The program has been characterized by three distinct periods. The similarity of events of the first and third periods, during which there were infectious cases of tuberculosis unsegregated, seems to indicate that the presence of even 1 case of infectious tuberculosis can result in a great increase in the incidence of both infection and disease in a very short time, and in the establishment of a chain of exposure and infection which is difficult to break. This is particularly true for individuals in a circumscribed environment such as the one in this study.

The experience shows that even when conditions for the control of tuberculosis are unusually favorable, constant, close supervision is essential to prevent the rapid spread of the disease among contacts. It also suggests that patients in such an environment would provide a suitable group for observation of the effectiveness of BCG vaccination.

Trimming the Tuberculosis Register*

JOHN H. KORNS, M.D., F.A.P.H.A.

Director, Division of Tuberculosis, Westchester County Department of Health, White Plains, N. Y.

TUBERCULOSIS case and contact registers tend to grow to unwieldy dimensions. Frequent and persistent trimming is therefore essential to efficiency. The first statement will be readily admitted by tuberculosis administrators. The second warrants some elaboration.

The writer has long believed and still believes that—in addition to dropping suspects who after a relatively brief period of observation appear to be non-tuberculous, and those contacts whose exposure has ceased and who have had a reasonable period of observation—there is also a rather large category of patients classed as apparently cured to be considered. It is his belief that this last group may be included safely among those to be discharged and not followed further.

If this is a sound premise the adoption of such a procedure yields the following benefits:

1. The nurses concerned are relieved, since they are freed to follow more needy patients.
2. Private physicians tend to be more coöperative with the tuberculosis workers if they know that patients' names are not routinely throughout life kept on the register for follow-up. They will listen to chest specialists but the specialists must follow a down-to-earth policy.
3. The taxpayer benefits.
4. Finally, in many instances the patient is pleased to know that he need no longer report to the clinic. Undoubtedly some patients are over-treated and tend to become neurotic invalids; so that discharging such persons should help rebuild their morale.

It goes without saying that an apparently cured patient will occasionally have sputum that is positive on culture. This is likely to be in connection with an upper respiratory infection, and may be temporary in nature. It is true also that a few reactivate. However, in the author's experience, these individuals are usually quick to consult physicians, having become tuberculosis conscious.

It must be remembered that a considerable proportion of tuberculosis patients who reach the stage where they can be classified as apparently cured have never been aware that they had clinical tuberculosis, and that they show by x-ray examination no more evidence of disease than do a good many of those healthy people whose lesions now-a-days are revealed only by mass x-ray surveys.

What is an apparently cured case? In the 1940 edition of *Diagnostic Standards* the following requirements were laid down: absence of constitutional symptoms, sputum, if any, negative by concentration, x-ray lesions stationary and apparently healed—these requirements to have existed for two years under ordinary conditions of life. Whether the new *Diagnostic Standards* will adopt more rigid requirements or whether the term "apparently cured" will be retained is not known to this writer.

* Presented before the Epidemiology Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

In order to test the validity of the premise that apparently cured patients may safely be discharged from further follow-up the writer attempted to secure information from 674 patients discharged as apparently cured between January 1, 1940, and July 1, 1947. Up to October 1, 1948, information was at hand on 459. Of these, 26 had died and 14 had reactivated but are still living. The remainder, 419, or 91 per cent, are well.

Of the 26 deaths, 24 were due to causes unrelated to tuberculosis. The average age at death was 68 and these patients had been followed by the tuberculosis division for an average of 7 person-years. Two of the 26 deaths were attributed to tuberculosis. One of these, a white male aged 64, died of chronic tuberculosis of the kidney and chronic cardiovascular-renal disease. The other, a Negro female, died at 45 of a pulmonary hemorrhage. She had had a minimal lesion, stationary by x-ray for 8 years, which reactivated 3 months before death.

There were 14 additional patients whose tuberculosis reactivated. Adding the 2 who died, the 16 who reactivated averaged 54 years of age at the time of reactivation, the youngest being 29. Fifteen of the 16 were white. Eleven showed minimal lesions at the time of discharge as apparently cured. Of the 14 still living, 6 are now classed as arrested while the lesions of 8 are still unstable. Those who reactivated were followed by the department for an average of 9.1 years per person. These 16 represent 3.5 per cent of the total whose present condition is known.

Finally, 419 of the 459 are living and well as far as the present inquiry could determine. The evidence was collected through the public health nurses and through a mailed questionnaire. While this method of inquiry is not so accurate as that supplied by serial x-ray films and sputum studies, it is of value. Interestingly, a large percentage of those discharged have continued to have x-ray examinations, either privately, in clinics, or by the mobile x-ray unit. The 419, analyzed by stage of disease and time-period observed, show that: the 213 minimal cases were followed for an average of 7.8 years; the 157 moderately advanced for 9 years; the 27 far advanced for 11.5 years; and 22 miscellaneous types for 8 years.

While the evidence presented does not warrant a dogmatic statement, it seems clear that the percentage of reacting cases—3.5—is so low as to warrant a continuation of the discharge procedure. Of course, discretion is needed in discharging patients from further observation. No criteria for selection of those to be discharged can be deduced from this limited number of cases. However, from general experience, one would be more reluctant to discharge patients whose family record suggests high biological susceptibility, young patients, or those with certain associated diseases such as diabetes or silicosis. When a patient is discharged he should be cautioned to seek medical advice if health fails or suggestive symptoms appear.

There is no magic formula for keeping the tuberculosis register up-to-date. One requirement is a physician willing to give the necessary time to scrutinize the register periodically and supplement the information there noted, then in conference with the nurses drop those whose further observation does not seem important from the standpoint of tuberculosis. The information on the register may be supplemented by correspondence, by telephone, or by personal conferences with private physicians and hospitals. This type of work is uninteresting, if not distasteful, to most physicians, but it is necessary if the register is to provide its maximum value.

Poisoning Due to Ingestion of Wax Crayons*

H. BRIEGER, M.D.

Department of Preventive Medicine, Jefferson Medical College of Philadelphia, Philadelphia, Pa.

IT is certainly of interest to public health workers that ingestion of wax crayons may lead to severe poisoning. Poisoning by wax crayons has also an aspect of considerable industrial importance. Its occurrence demonstrates that finished dyes which are practically insoluble *in vitro* are soluble in the body, and not as harmless as described in the literature.

Innumerable children ingest wax crayons. According to crayon manufacturers, many reports of untoward effects have been received, but these complaints were not substantiated; actual poisoning was not reported until 1947. At that time, we described a definite and almost fatal poisoning due to ingestion of wax crayons.[1] Since then, 9 other cases have been published or will be published soon.[2-5] The picture of all cases has been rather uniformly that of acute, severe methemoglobinemia.

So far, four different brands of wax crayons of red-orange, orange, yellow, and violet color have been involved. We have found Para Red in red-orange and orange crayons[1]; an analysis of yellow crayons by the Food and Drug Administration[2] has shown benzidine yellow YB. Both dyes are derived from methemoglobin-forming compounds—paranitraniline and benzidine. Our investigation has concentrated on wax crayons containing Para Red, and on this dye itself.

Para Red was originally produced by coupling diazotized paranitraniline with β-naphthol. This compound has been found to be slightly soluble in water. Hence, the Para Red used in dyeing cotton is now made by coupling paranitraniline with Naphthol-AS or similar amides.[6] The pigment used in wax crayons is, according to one manufacturer, chlorinated Para Red. A sample of this pigment was examined, and also a sample of Para Red provided by E. I. duPont de Nemours and Company, Inc. Both pigments were, as far as we could ascertain, practically insoluble in water, diluted acid and alkali, or in standard solvents with the exception of benzol. Para Red was added to stomach fluid of pH 1.1 to 8.15, shaken in a Waring Blendor, incubated for twenty-four hours at body temperature, and shaken again. After filtering, the fluid did not contain Para Red. The same results were obtained with chlorinated Para Red.

We have not been able to produce methemoglobinemia in dogs and rabbits by feeding wax crayons and Para Red or by injecting concentrated suspensions of Para Red intravenously. However, Dr. Samuel S. Spicer[7] of the Laboratory of Physical Biology, U. S. Public Health Service, with whom we have coöperated in this matter, has observed methemoglobinemia and Heinz bodies in one-third of fasted cats fed red and red-

* Presented before the Industrial Hygiene Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 10, 1948.

orange crayons. Four of six cats which had received Para Red in the diet showed methemoglobinemia and Heinz bodies, the other two cats having ingested only very small doses (0.5-0.6 gm.). Intravenous injections of suspensions of Para Red were without effect. Dr. H. Russell Irwin,[5] formerly of the Children's Hospital, Los Angeles, fed yellow crayons to cats and observed methemoglobinemia within 5 hours of ingestion. In comparing our negative results with the positive results obtained by Spicer and Irwin, it has to be taken into consideration that cats respond much more readily to methemoglobin-forming substances than dogs or rabbits.

The findings in human beings and in cats establish the fact that, in a small percentage of individuals, ingestion of wax crayons produces methemoglobinemia and Heinz bodies. The crayons examined so far contain two finished dyes derived from methemoglobin-forming compounds. Feeding of one of these dyes (Para Red) to cats resulted in methemoglobinemia and appearance of Heinz bodies when enough of the dye was ingested. Para Red is practically insoluble *in vitro*; it is apparently free of an excess of paranitraniline, of other intermediary substances or of impurities. We are continuing the study of the mechanism of this type of poisoning.

EDWARD E. SCHWARTZ
FORREST E. LINDER, PH.D., F.A.P.H.A., *Presiding*

The round table was opened with a statement of the question to be discussed, namely: what are the deficiencies in present recording procedures and forms and how may records be made more effective and less burdensome to the people who have to use them?

It was agreed that a primary deficiency of records is difference of philosophy and lack of clear definition as to the purposes they should serve. In general there are three broad uses for records as follows:

1. *Administration:* Records are used to collect information for evaluating and guiding programs.
2. *Research:* Information is collected for making special studies.
3. *Clinical or Individual Use:* Records are used by nurses and physicians for management of the individual case.

Frequently records must serve simultaneously more than one of these purposes. For example, items may be recorded for research purposes on individual case records. Frequently, information for administrative purposes must be obtained from case records.

Many record difficulties arise because the users fail to define clearly the purposes which individual items on a record must serve. Items may be included haphazardly, "in case someone may want them," without much careful consideration of exactly what is needed or why. Persons concerned with case supervision, who are usually the collectors of all types of data, do not understand why certain items necessary for other purposes are included nor are they given sufficient explanation as to what information is wanted or how it is to be used. Items required for research purposes may be left on a record form long after they have ceased to be used. In fact, many record forms are allowed to become archaic because of infrequent review of the purposes for which they are being used. The attempt to secure information for multiple purposes often results in unnecessary complication of forms and procedures.

A first step in improving the effectiveness of records as an administrative tool is study of how programs are to be evaluated. Consideration must be given in the collection of administrative statistics to provide for meeting the evaluation criteria of federal departments and state health departments as well as to provide the more detailed data needed in local administration of the program. In general, all data used for evaluation purposes attempt to measure three phases of the program: first, the extent

* Summary of a report of a round table discussion before a Joint Session of the Maternal and Child Health and Statistics Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.
Prepared by Marjorie T. Bellows, American Heart Association, New York, N. Y.

of the problem; second, amount and cost of services rendered; and third, the extent to which the services rendered have met the problem. It is the joint responsibility of the administrator and statistician to define precisely the facts needed for evaluation, to design record forms and procedures which will obtain these facts and, in coöperation with field personnel, to try out the forms and procedures to see that they obtain the desired data efficiently.

To provide better records for administrative use the following practical steps were suggested:

1. Precise definition of what data are wanted

2. Decision as to whether or not the desired information is worth getting in terms of cost, energy required, and utilization.

3. Distinction between administrative and research information. It is very frequently inefficient to try to collect both types of data at the same time.

4. Discontinuation of use of records when they have served their purpose. Two devices were suggested as means of getting rid of records. One was to approve a record form until some specified expiration date when the form must be rejustified. The other suggestion was to discontinue forms of dubious usefulness and see whether or not there was a request for them to be reintroduced.

5. Intercommunication between federal, state, and local departments in defining types of data needed by each.

6. Test studies of the use of all records before they are put into general use.

Negroes Help Themselves

Webster Parish in Louisiana has a population of about 35,000, nearly half of whom are Negroes. Early in 1947 the Parish Health Officer, E. B. Godfrey, M.D., presented to the parish Negroes a picture of Negro health conditions as found by the local health department. The Webster Parish Teachers' Institute decided on a tangible program of health supervision of school children.

During the school year 1947–1948, by an arrangement with the Phillips Hospital at Minden, and by providing bus transportation, 92 per cent of the nearly 3,500 Negro school children in the parish were given medical examinations. Treatment was recommended for 83 per cent of those examined and corrective measures taken for 7 per cent of those needing it.

Forty per cent of the children had throat defects, 30 per cent, nutrition defects, and 20 per cent, defects of teeth—the three most common conditions found.

During the current school year every child is being given follow-up treatment regardless of financial need. Other items in the current program are 100 per cent dental, eye, and chest x-ray examinations, nutrition service through school cafeterias, development of a preschool health service, among others. The next report of Webster Parish Negro School Health Service should be of special interest as a pilot program.

Evaluating A.P.H.A. Exhibits

ANDIE KNUTSON, PH.D.
Chief, Research and Evaluation Section, Office of Health Education, U. S. Public Health Service, Washington, D. C.

THE general purposes of this study were to evaluate the relative effectiveness of the 42 scientific exhibits on display at the Boston A.P.H.A. meetings, November 8–12, 1948, and to investigate some methods for pretesting such exhibits. An attempt was made to measure effectiveness both from the exhibitor's and the observer's points of view.

At times in the past, data on the amount of attention the exhibits attract and the amount of interest they sustain have been submitted as evidence of their effectiveness. Such data were not regarded in this study as evidence of effectiveness, but, rather, as evidence that certain conditions necessary for effectiveness have been satisfied. An exhibit may very well satisfy these conditions while still leaving the observer uninformed, with negative attitudes, or dissatisfied, without any desire to act.

In this study, the measure of effectiveness from the exhibitor's point of view was considered to be its success in accomplishing the specific purpose for which it was designed, whether that purpose was to incite curiosity, to inform, to educate, to elicit action of some kind, or to obtain a list of prospective customers.

CREDITS: This study was made by the U. S. Public Health Service at the request of the Committee on Scientific Exhibits: Franklin M. Foote, M.D., *Chairman*; Paul H. Brown, M.D., Homer N. Calver, Vivian Drenckhahn, Francis B. Elder, Horace Hughes. S. S. Lifson, Willimina R. Walsh. Frank Kiernan acted as an advisory member.

Grateful acknowledgment is made to the 30 A.P.H.A. members who helped in the evaluation and to Prof. Leslie Irwin of Boston University and Prof. Curtis M. Hilliard of Simmons College and their students who participated in the evaluation and served as interviewers.

THE METHODS

Two separate approaches were used in accomplishing the purposes of this study: (1) Interviews were conducted with a sample of A.P.H.A. members and visitors in a public opinion survey; and (2) a group of members and students participated in an evaluation of the success of the exhibits in achieving their objectives as stated by the exhibitors.

Methods used in earlier museum and health education exhibit studies were considered in planning this investigation. Use was also made of the findings of earlier studies in interpreting the results obtained and in outlining methods of applying the data available on successful exhibits to the improvement of new exhibits.*

The Public Opinion Survey

In all, 217 A.P.H.A. members and guests were interviewed. About 80 per cent of these interviews were made in the vicinity of the exhibit hall, but out of sight of the exhibits themselves—at the exits, in the meeting rooms, and in the cafeteria. The remainder of the interviews were made at the entrances to the meeting rooms at Hotel Statler. An attempt was made to select persons at random, but the sample cannot be considered a truly random sample of

* A discussion of the history of exhibit evaluation and the motivational basis of the present approach has been deleted for lack of space.

A.P.H.A. members attending the meetings: persons who did not attend meetings or view the exhibits on Thursday and persons who said they did not have time to participate were not represented in the sample. A comparison of the sample interviewed with the A.P.H.A. members attending the Boston meetings suggests that the sample was nevertheless fairly representative by Section membership.

The interviews with A.P.H.A. members and guests were conducted after the exhibits had been available for inspection 3½ days.

The interviewing was performed by students of Boston University and Simmons College who volunteered their services. Most of the interviewers were graduate students; many of them had had previous interviewing experience. Although only a brief instruction period was possible, internal analysis of the data suggests a conscientious job of interviewing.

Evaluation of Exhibits in Achieving Objectives

As a means of determining how well the exhibits were attaining their objectives, a comparison was made between the statements of the objectives made by the exhibitors and similar statements made by 30 A.P.H.A. members and 20 student volunteers. The members who participated in this work were assigned by A.P.H.A. Section chairmen in proportion to Section membership. The student volunteers were juniors, seniors, and graduate students from Boston University and Simmons College.

A comparison of the responses of students and A.P.H.A. members who carried out this work of evaluating the scientific exhibits served as a test of the reliability of students in evaluating such exhibits.

THE FINDINGS

The Time Spent at Exhibits

As one rough measure of the time spent at exhibits, the sample of A.P.H.A. members was asked the question, "In all, about how much time have you spent so far in going over the exhibits?"

*The median time spent as measured by the responses to this question was about 2½ hours or for the 150 exhibits, approximately one minute per exhibit.**

TABLE 1

"In all, about how much time have you spent so far in going over the exhibits?"

	Per cent *
None at all	6
½ – 1 hour	13½
1½ – 2 hours	25
2½ – 3 hours	21½
3½ – 4 hours	11½
4½ – 5 hours	7½
5½ – 6 hours	6½
More than 6 hours	8½
	100

* Percentages are based on the responses of 201 persons who answered the question in the opinion survey on Thursday afternoon.

These findings agree in general with the studies previously carried out by Robinson,[19] Derryberry and Weissman,[7] and Nielson,[17] who have made time studies of persons viewing museum and public health exhibits. In the study of exhibits displayed at the World's Fair, it was found that "the time spent in observing each of the 30 exhibits in the Medical and Public Health Building ranged from 20 seconds to 285 seconds —that is, from 1/5 of a minute to 4¾ minutes. In the Hall of Man which contained relatively small exhibits, the average observation time at each exhibit was only about one-fifth as much as would be required to make a complete inspection of it. In the Hall of Medicine which contained larger exhibits the visitor spent on the average little more than one-twentieth of the time required for a complete visit."[7]

* While the study was concerned with the 42 scientific exhibits, this particular response involved the time spent at all the exhibits present—commercial and scientific. No distinction could be made.

Nielson, who has more recently used a concealed motion picture camera to record visitor behavior in a museum, reports that "statistical analysis of time-of-stay-at-each-exhibit, revealing as it did variations in average time of from 9 seconds to 1 minute, and range of from 5 seconds to 3½ minutes per exhibit, holds great educational implications . . ."[17]

The Exhibits Most Favorably Remembered

The interview schedule used in making the survey of A.P.H.A. members contained five questions which yielded a measure of the exhibits which were most favorably remembered by A.P.H.A. members.

1. What exhibit did you like best?
2. What other exhibits did you find most interesting and worthwhile?
3. Since you have been over the exhibits, have you discussed any of them with anyone? (If *yes*) Which ones did you discuss?
4. This is a list of the scientific exhibits on display. Would you please pick out the one scientific exhibit you found most interesting and worthwhile?
5. Which other 2 of these exhibits did you personally find most interesting and worthwhile?

The first three of the questions used were free answer or direct recall questions in the sense that the A.P.H.A. member was provided with no list from which to make a selection. The last two questions were recognition questions—a list of the scientific exhibits was provided and the subject would select from this list the exhibits he found most interesting and worthwhile.* From the responses to these five questions a score was obtained for each of the scientific exhibits and a comparison could be made in terms of the total score, the score on the recall questions, and the score on the recognition questions.

Six of the 42 scientific exhibits used at the A.P.H.A. offered an opportunity for all visitors to participate by acting in carrying out a personal purpose.† This was in addition to a number of exhibits which offered consultation services to persons with specific interests. Those offering all visitors an opportunity to act in some way in achieving a personal purpose were:

The American Public Health Association Exhibit—"An Exhibit is an Exhibit is an Exhibit"—offered assistance in planning exhibits.

The Brookline Health Department exhibit gave diabetes tests to persons who were interested.

The Massachusetts Department of Public Health exhibit provided an opportunity for visitors to obtain eye examinations.

The Merit System Service exhibit offered tests to visitors.

The National Publicity Council for Health and Welfare Services exhibit invited visitors to take tests and to discuss and obtain health education materials.

The U. S. Public Health Service exhibit offered an opportunity to take part in demonstrations, to discuss jobs in the service, and to obtain and discuss health materials available through the U. S. Public Health Service.

The six exhibits that offered visitors a chance to act in achieving a personal purpose were heavily represented among the most favorably remembered exhibits.

Visitor participation in satisfying a personal purpose was a feature of:

5 of the 6 exhibits receiving the highest recall score

3 of the 6 exhibits receiving the highest recognition score

4 of the 6 exhibits receiving the highest total score (Table 2)

The recall score was considered to be the better of these measures of the success of an exhibit. Recall questions probably yield a truer estimate of what people carry away from the exhibits in their experiences, rather than in their notes

* The exhibits were listed in alphabetical order. Some bias may have resulted from the order in which the exhibits were listed, but the score distribution shows no apparent relation to the order of listing.

† This conclusion is drawn from an examination of descriptions of the scientific exhibits as published in the Official Program, Seventy-sixth Annual Meeting, American Public Health Association, November 8–12, 1948, pp. 71–75.

and literature. They are most like the questions our friends ask us when we have returned from a convention—"What exhibits did you like best?" Our friends do not have a list of the exhibits for us to look at in giving our judgment. Nor do we normally refer to our notes and literature before we reply.

It was observed that a few exhibits tended to obtain relatively higher scores on the recall questions than on the recognition questions whereas a few exhibits obtained relatively higher scores on the recognition questions. The four exhibits in which the recall score was most disproportionately high and those four in which the recognition score was most disproportionately high were selected for analysis in order to obtain some insight into the features of the exhibits most frequently recalled but not selected from a list as having high merit.

When this comparison is made, it is found that three of the four exhibits having a relatively higher recall score were exhibits in which visitors could participate in satisfying a personal purpose. On the other hand, not one of the four exhibits having a relatively higher recognition score was an exhibit in which visitors participated in this way. There was a tendency for the technically elaborate exhibit to be more often selected from the list and for the exhibit which

	Recall score	*Recognition score*
* An Exhibit is an Exhibit	8	–
Massachusetts Tuberculosis and Health League	11	2
* Merit System	25	9
* National Publicity Council	41	11
American Academy of Allergy	5	17
American Heart Association	5	33
National Tuberculosis Association	3	16
Research Council on Problems of Alcohol	3	13

provided an opportunity for participation to be more frequently mentioned when no exhibit list was available to stimulate the response.

The Exhibits that Were Best Understood

Each of the 42 exhibitors was asked to complete these statements about his exhibit in no more than 25 words:

"The primary objective of our exhibit is . . ."

"The main points we want to impress upon those who see it are . . ."

The 30 A.P.H.A. members and 20 students participating in the evaluation were provided with data sheets and were asked to complete these same statements for each of the scientific exhibits present. They were advised of the purpose of the study, and were asked not to rate or rank the exhibits, but only to complete these statements to the best of their abilities. No time limit was set for viewing any particular exhibit; the data sheets were returned in about 48 hours.

Three of the A.P.H.A. exhibits (National Publicity Council, Merit System, Vocational Guidance) were not included on the data sheets used for this evaluation because they were considered by the A.P.H.A. to be services rather than exhibits. It is significant, however, that the membership interviewed thought otherwise; the National Publicity Council and Merit System exhibits were among those most favorably remembered, as measured by direct recall questions.

A comparison of the exhibitor's statement of objectives and the observer's statement of objectives has been made for each of the scientific exhibits studied. The findings have been presented individually to the exhibitors for their information. This analysis, however, brought out some relationships pertinent to anyone planning a scientific exhibit:

1. Nearly all the exhibits studied served some purposes different from those planned by the exhibitor. In some instances, objectives not mentioned by the exhibitor were most frequently stressed by the observers as the primary objectives of the exhibit.

2. Exhibits with simple, clear objectives were better understood. A close relationship existed between the simplicity of the objectives and the frequency with which they were reported by the observers. Difficult vocabulary and statistics lead to poor understanding.

3. Some exhibits were designed to satisfy purposes of the audience; others were planned to achieve objectives of specific interest to the exhibitor but of secondary interest to the audience. (Example: to promote the name or program of the sponsoring agency.) Exhibits planned to satisfy the purposes of the audience were more successful in achieving their objectives than exhibits aimed toward furthering purposes specific to the exhibitor. Observers tended to interpret the exhibit objectives in the light of their own experiences and wants.

4. The findings of the present investigation suggest that college juniors, seniors, and graduate students can be successfully employed to pretest exhibits designed for professional audiences. Their interpretation of the message imparted by the exhibits were very similar to the interpretations given by A.P.H.A. members.

Suggestions of A.P.H.A. Members for Improving Scientific Exhibits

In the public opinion survey of A.P.H.A. members and guests, the question was asked:

"Do you have any suggestions for making the scientific exhibits more useful and effective so A.P.H.A. members would get more out of them?"

In response, more than half of those interviewed offered suggestions for improvement. (See Table 3.)

About one-fourth of the suggestions offered were concerned with improving the exhibit in some physical way, by putting more life into them through the use of gadgets, visual aids, color, movement, graphs, etc., or by building them to present specific central themes.

Another fourth of the suggestions indicate that many members desire more opportunity for an interaction between the observer and the exhibit. These members ask for better and more active

TABLE 3

"Do you have any suggestions for making the scientific exhibits more useful and effective so A.P.H.A. members would get more out of them?"

Suggestions about exhibit makeup		25%
Should put more life into them by using more gadgets, visual aids, color, movement, graphs, etc.	18%	
Should have central and specific themes	7	
Suggestions concerning greater interaction between observer and exhibit		25%
Should have better and more active attendants	9	
Should have more audience participation	9	
Should offer more literature, samples	4	
Should include demonstrations or lectures	3	
Suggestions about location, spacing, grouping, selection		53%
Should have better location, more and better spacing	26%	
Some other (specific) organization should have had exhibit	9	
Scientific exhibits should be given better and separate location	7	
Should reduce number of scientific exhibits and increase standards	6	
Should have better grouping and organization	4	
Should call them Educational Exhibits	1	
Suggestions about guidance and programs		17%
Should have better maps, directions, signs, etc.	9%	
Should keep time on program open for exhibits	5	
Should have better reception facilities, seats, lounges, etc.	3	
Other suggestions		4%

* Percentages are based on 117 persons who gave suggestions. Percentages add up to more than 100% because some persons offered more than one suggestion.

attendants more opportunity for audience participation, literature and samples, demonstrations or lectures.

APPLICATION OF THE FINDINGS: THE PRETESTING OF EXHIBITS

Pretesting is one means of applying the findings of evaluation to an operating program. It is the positive side of evaluation. It is the one means we have of making immediate use of data collected in earlier evaluation studies.

In the case of exhibits, for example, studies carried out at the New York World's Fair, the study of exhibits at the A.P.H.A. conference in Boston, and the findings obtained in other investigations have provided us with objective data on the characteristics of the more successful exhibits. We can apply these data in testing planned exhibits to determine whether or not it is possible for new exhibits to be effective.

On the basis of such pretests, concrete recommendations for improvement can be suggested, and desirable revisions made prior to displaying the exhibit—in fact, in large part before building the exhibit. At times some estimates may be made as to the probable effectiveness of the exhibit as related to its cost in time and effort.

It is important that this pretesting or preëvaluation be carried out on groups similar to those toward which the educational program is being directed. Persons of different economic, social, and educational levels differ so widely in their experiences and in their goals in life that it is not possible for them to view social situations in the same manner. Professional persons observing an

exhibit designed for a low income group may react in a manner completely different from the non-professional worker for whom the exhibit is planned. Only by testing the exhibit on a group of these lower income persons toward whom it is directed can we be certain that the exhibit is able to put across the message it carries.

Several approaches may be made in evaluating an exhibit prior to using it. The answers to the following questions will yield an operational index to the probable success an exhibit will have in imparting a well understood message to the largest possible audience at a minimum cost per effective exposure.

Is it physically possible to read the exhibit from the point of observation?

It seems obvious that the size of print, adequate contrast of light and dark, the possible obstacles to easy reading or easy observation, the location of pamphlets or other reading materials in the normal focus of attention, etc., can be determined prior to using an exhibit. In practice however, this simple requirement of the possible success of an exhibit is not always met. As a result, exhibits are sometimes displayed in such a way that the audiences cannot successfully follow them even though they might otherwise be inclined to do so.[5, 6]

As a test, the exhibit can be given a trial exposure to a group of laymen. If they indicate in response to a series of questions that they have had difficulty seeing any part of the exhibit clearly, or that they have had to get into awkward positions to view the entire exhibit, revisions should be made.

Attendants should be advised of this problem so they do not permit vases, hats, coats, seated visitors, etc., to obscure the exhibit. If materials are available for distribution they should be placed where they can easily be seen. Materials placed on racks below the exhibit are frequently overlooked.

Does the exhibit sustain interest long enough to be read completely?

Previous studies already cited have shown that few people spend much more than 1 minute at any single exhibit unless the exhibit is especially successful in sustaining interest. An exhibit that does not involve the visitor in some purposive activity is not likely to impart a complete message unless that message can be read within 1 minute.

Prior to completing an exhibit, a test can be made of the time required to observe the exhibit and to read the complete message. A number of lay persons can be timed while they read through the entire exhibit at their normal reading pace.

Is the vocabulary and style of writing used such that the intended audience can comfortably follow and understand the exhibit?

Frequently the terminology and style of writing used in an exhibit is such that only a small proportion of the intended audience can understand the text or labeling. Experts tend to forget that the most frequently used terms in their area of specialty may be completely foreign to persons having a different pattern of education and experience. They may err in attempting to rely on their personal estimates of the level of understanding of audiences of lay persons or persons in other areas of specialization.[2, 5, 6]

Before an exhibit is completed, objective measures can be employed to determine what level of reading ability is required to understand the labels, text. One of several available scales of readability, such as the Flesch Scales[8] may be used for this purpose. The Thorndike word list[22] or some other word list based on the frequency of popular usage or understanding can be employed to locate specific words or terms that may not be fully understood.

Will all graphs, charts, and diagrams be clearly understood by the intended audience?

There is need for more data on the capacity of adult populations to understand graphic techniques used in exhibits. Studies made of school children suggest that children leave grade schools without adequate training in the interpretation of graphs and charts. Since little emphasis is placed upon the interpretation of such media during the high school years, it is possible that even simple graphic techniques may be misunderstood.

Charts, graphs, or diagrams which seem simple to persons with one pattern of experience may have no meaning at all to persons without such experience. This may account in part for the low interest shown by many adults in the graphic health exhibits displayed at the World's Fair.[6]

Diagrams, pictures, charts, figures, objects, instruments, and other materials which are self-explanatory to the exhibitor are sometimes completely unfamiliar to the layman. Failure of exhibitors to realize this has sometimes resulted in inadequate labeling and the use of unexplained materials. Serious errors in interpretation result.

Calver,[2] Cummings,[5] and Derryberry [6] have all emphasized the need for getting the responses of lay persons to charts, graphs, or other visual materials used. This may be done by having a number of laymen view the exhibit and respond to some direct questions about the meanings of different parts of the exhibit. This will assure that all parts of the exhibit will be clearly understandable to the intended audiences.

Does the exhibit tie in with the interests of the visitor and offer him a chance to participate in satisfying a personal purpose?

Findings from a number of investigations indicate that when people have a chance to participate actively in the learning process they learn more quickly. This is especially true when the goal to be achieved is one in which they are personally involved. The needs, values, and purposes people have serve them as filters in sifting out of the environment certain things to see and hear, to remember and to act upon. New information is accepted and new attitudes are assumed when these fit in with and serve personal needs, values and purposes.[2, 4, 10, 16]

These findings are as applicable to exhibits as to other educational media and techniques. The exhibits that attract most attention, sustain interest, and are remembered most favorably tend to be those that provide an opportunity to talk, to discuss problems, ask questions, obtain literature, take tests, or act in some other way in satisfying a personal purpose.

Will the exhibit impart a message that it is desired to impart?

In the present investigation, as in the study of health exhibits at the World's Fair,[6] it was found that the exhibits with a single, clear theme were better understood than those that attempted to cover too much ground. An attempt to present too many or too difficult objectives leads to confusion on the part of some of the observers and indifference on the part of others.

A student or lay group can be used to test the effectiveness of an exhibit in imparting a fully understood message. Observers can be asked to write a statement of the primary objective and main points impressed by the exhibit. These can then be compared with the exhibitor's statement of objectives and main points as in the present study. Care should be taken to assure that the observers arrive at their conclusions independently without direction or influence. Lack of agreement between the exhibitor's and observers' statements

will suggest steps which may be taken to improve the effectiveness of the exhibit in getting its message across.

Bibliography on Refuse Collection and Disposal

A bibliography of references dealing with refuse collection and disposal is now available free of charge through the Division of Sanitation, U. S. Public Health Service, Washington 25, D. C. The bibliography contains references arranged alphabetically by author, to material published during the years 1940–1948, and is based on a review of 12 indexes, readers' guides, and services.

THE ACCIDENT-PRONE INDIVIDUAL

THE word "accident" carries with it a strong flavor of unpredictability and causelessness. In its various definitions, Webster uses the phrases: "an undesigned and unforeseen occurrence," "chance, contingency," "fortuitous or nonessential property," "an unexpected happening not due to any negligence or malfeasance."

Accidents of the quality suggested by these terms may occur, as when a house is struck by lightning; but such occurrences are rare. The vast majority of accidents are not in the true sense due to "chance." They are not "fortuitous," but the result of human action (or inaction). They can in large measure be foreseen; and, though not "designed" consciously, they are in a subtler sense determined by underlying trends of human personality.

Furthermore, the qualities which lead to accidents are more often to be found in the subject who suffers from the accident than in the carelessness of some other individual. A bridge may collapse because it was badly constructed. A pedestrian may be killed by a reckless driver without any error of his own. On the whole, however, the major proportion of accidental casualties are victims of their own personality make-up.

This fact has been clearly demonstrated in the case of street accidents. A six year study in the State of Connecticut showed that less than 4 per cent of the drivers involved in traffic accidents were concerned in 36 per cent of all such accidents. The same relation has been clearly shown in industry. A large trucking company reduced its accident rate to one-fifth of its previous level by discovering its accident-prone drivers and transferring them to other occupations, and in their new occupations, these drivers maintained their accident-proneness, though with less serious results. There is no such clear evidence with regard to home accidents; but there can be no doubt that the same basic principles obtain. Helen Flanders Dunbar has characterized the malady from which such individuals suffer as "accidentitis."

Franz Alexander [1] has presented a most helpful analysis of the accident-prone personality. The factors related to this type of individual are not clumsiness or

stupidity or absent-mindedness; but are concerned with much more fundamental traits of emotional make-up.

Dunbar [2] describes the accident-prone individual as "decisive or even impulsive. He concentrates upon immediate pleasures and satisfactions. He is apt to act upon the spur of the moment. He likes excitement and adventure; he does not like to plan and prepare for the future."

A second factor in accident-proneness, of even more fundamental significance, has been indicated by studies such as those of Rawson [3] and Ackerman.[4] This is an instinct of rebellion and resentment, the "show-off" and "don't give a damn" type of psychology. Two cases illustrate this point. "A youth was driving his mother on a shopping tour. He begged her for the use of the car for a fishing party the following day. She refused, whereupon he fidgeted angrily, 'accidentally' stepped on the accelerator and sent the car into a ditch." Again, a 16 year old boy says, "It was really my fault because mother said supper was ready and I was not to go out. I went out anyway, got into a wrestling match and got my arm broken. Anyway, *I guess mother's sorry she's so strict with me.*" These happen to be adolescent cases but, of course, the same feeling of rebellious self-assertion carries on into adult life. The person concerned does not plan an accident; but the psychiatrists say that "most accidents are unconsciously intended," in the sense that the victim is motivated by basic desire for violent action.

Finally, the psychiatrists discern, in many accidents, a still more subtle factor, an underlying sense of guilt combined with the motive of self-assertion—a sense which subconsciously seeks self-imposed expiation. Alexander cites the case of a man who had led a highly frustrated life, complicated by a violent quarrel with his father. He suffered an automobile accident on the way to the psychiatrist's office and when visited in the hospital, bandaged up like a mummy, "all one could see of his face were his eyes, shining with a euphoric light. He was in good spirits, free from the oppressive melancholy of recent days. The contrast between his physical condition and his mental state was striking. The first words with which he greeted me were, '*Now I have paid for everything*, now I will at last tell my father what I think of him.'"

Dr. Alexander closes his paper as follows: "In summary, the accident-prone individual is an impetuous person who converts immediately into action his momentary impulses without deliberation and planning. He harbors a deeply ingrained rebellion against the early excessive regulations of his upbringing—a deep resentment against persons in authority. At the same time he has a strict conscience which makes him feel guilty for this rebellion. In the unconsciously provoked accident he expresses his resentment and revenge, at the same time atoning for his rebellion by his injury."

An important corollary of this new concept of the psychological factor in accidents is the responsibility of the health department in accident prevention. When we thought of the accident hazard as primarily an engineering problem, control of this hazard might properly be assigned to the highway department and the labor department. If, as we now begin to realize, it is most often a problem of human psychology, the health department, with its medical background, is the indicated agency. The treatment of the accident-prone individual may generally be so serious a psychotherapeutic problem as to be far beyond the range of present-day planning. The recognition of such an individual is a much simpler

task; and his removal from the steering wheel of a car, or from the proximity of a dangerous machine would be a fruitful objective for the health administrator.

SANITARY NEEDS OF THE NATION

AT our Boston meeting last year, Abel Wolman called attention to the fact that we still fall far short of desirable standards in the fulfillment of the elementary needs of basic sanitation.[1] A recent issue of *Public Health Reports* [2] gives a clear quantitative picture of the extent of our deficiencies.

This survey was conducted by a sampling method, covering communities including 75 per cent of the population of the United States. The proportion was over 95 per cent in communities of 25,000 population or more, but graded down to 65–70 per cent in communities of between 5,000 and 25,000 population, to 25 per cent in communities of 500–1,000; and to 12 per cent in communities under 500.

It was estimated that some 80 million people need new or improved public water works; and the figure for new or improved sewage systems is 86 million. Better facilities for disposal of garbage and refuse are needed by some 70 million people. Adding to either of these figures about 30 million persons in rural areas in need of improved water supply and excretal disposal, we get a picture of over two-thirds of the population in which full sanitary ideals have not yet been attained. It should be remembered that the great majority of these needs in cities are for improvement or extension of existing systems; but over 2 million persons live in communities which should have community water supplies which they now lack; and over 6 million people live in communities which should have sewerage systems which they now lack.

The total cost of all desirable improvements is estimated at over 2 billion dollars for water supplies, nearly 4 billions for sewerage and sewage disposal, nearly 2 millions for garbage and refuse disposal, and nearly 2 billions for rural sanitation—$7,834,000,000 in all. By states, the estimates run from $5 millions in Nevada to over $1,447 millions in New York.

Surgeon General Scheele in his introductory foreword points out that this study "represents the first evaluation of our sanitary facilities on a national scale by actual field investigations. Concerted action in satisfying the needs outlined in the report should take us a long way toward providing a safe environment in which everyone may live."

NITRATES IN RURAL WELL WATERS

OLDER workers in the field of water bacteriology will recall the gradual replacement of chemical analysis by bacteriological examination as a criterion of the sanitary quality of a water supply. Long ago, the uselessness of determinations of "free ammonia" and "albuminoid ammonia" became clear; although too many health department laboratories continued to make such analyses for years after they

had lost any meaning. Those who considered the subject thoughtfully, however, pointed out that the nitrate content of a ground water might still have some significance, as indicative of pollution so remote that colon bacilli might not be found in significant numbers at a given moment but might be present under some other conditions.

In 1940, Schwartz and Rector[1] called attention to the extremely interesting possibility that the nitrates themselves might play an important role in disease causation on their own account and not because of their fecal origin. A series of studies during the past five years has indicated the soundness of this conclusion. In particular, Johnson, *et al.*[2] and, particularly, Robertson and Riddell[3] have made important contributions to this subject. Cornblath and Hartmann[4] demonstrated that when the nitrate content of water is high, the nitrates may be changed to nitrites in an infant having a high gastric pH; and that these nitrites when absorbed in the blood stream, may change hemoglobin to methemoglobin, causing anoxemia and cyanosis.

Robertson and Riddell[3] report 12 cases of cyanosed infants in the Regina area. Ten of these cases were definitely identified as methemoglobinemias; two of them fatal. All were in infants who had been fed on formulas containing water of high nitrate content from shallow wells. These authors present the results of analyses of 2,000 water samples from rural Saskatchewan wells, which showed 31 per cent containing more than 10 p.p.m. of the nitrate ion and 25 per cent containing more than 20 p.p.m. The latter is a figure which they believe indicates a serious hazard, and—like the Iowa workers—the Saskatchewan authors suggest 10 p.p.m. as a desirable limit. The problem deserves the serious study of health laboratories in all our rural areas.

WILLIAM A. EVANS

THE Association lost one of its distinguished old-time leaders in the death of William Augustus Evans on November 8, 1948, at the ripe age of 83. Dr. Evans was born in Marion, Ala., August 5, 1865. He took his medical degree at Tulane in 1885, and six years later moved to Chicago. He taught at the College of Physicians of the University of Chicago until 1908 (with the rank of Professor from 1895). In 1907, he was appointed Health Officer of Chicago, serving in that capacity for four years. In 1908, he joined the faculty of Northwestern Medical School, holding the title of Professor of Public Health Emeritus in that school at the time of his death. In 1910, he received the degree of LL.D. from his Alma Mater, Tulane (and later from the University of Mississippi in 1921). At the close of his term as Health Commissioner in 1911 he received the degree of Dr.P.H. from the University of Michigan. He served as President of the American Public Health Association in 1917.

Dr. Evans was one of the most vigorous and progressive health officers of his day and generation. In Chicago he was responsible for three policies which represented notable vision thirty years ago. He took a strong stand for the pasteurization of milk (then not a very popular cause). He was one of the first

health officers to initiate active study of the problems of air hygiene, bringing together hygienists and engineers to discuss them and formulate policies for school and factory ventilation. Finally, he was a bold and effective pioneer in health education. His weekly bulletin (in an edition of 7,000), his special bulletin for factories and stores, his well organized lecture bureau, were far in advance of the times; and on his retirement from the Health Department in 1911 he became health editor of the *Chicago Daily Tribune*, continuing his educational work through its columns for twenty-three years.

The highest quality of a health administrator is, perhaps, his ability to do what others will be doing twenty years later. By this standard, W. A. Evans earned a place of distinction in American public health.

Take a Test

The Merit System Service booth at the American Public Health Association annual meeting in Boston attracted considerable attention with its "TAKE A TEST" exhibit. This consisted of six short sample tests, designed to illustrate the type of service being offered by the Merit System Service and to show how public health information, experience, and judgment can be measured by objective examinations.

The exhibit was repeated at the Western Branch meeting of the American Public Health Association in Los Angeles, Calif., May 30 to June 1.

The results for the Boston meeting are available in an attractively bound report which contains copies of the six sample tests, an answer key, an analysis of the scores of the persons tested, and an analysis of the items themselves. The latter illustrates the method which is used to evaluate the effectiveness of individual questions. The report may be obtained by writing to the Merit System Service, American Public Health Association, 1790 Broadway, New York 19, N. Y. $1.00.

Q Fever

A Note Clarifying the Identity of American Strains of *Coxiella burnetii*

ELIAS STRAUSS, M.D., AND S. EDWARD SULKIN, PH.D.
Dallas, Tex.

THE purpose of this note is to call attention to a confusion in the literature regarding the identity of the Nine-Mile [1] and Dyer [2] strains of *Coxiella burnetii*. A number of statements are made in the literature which would indicate that these strains are identical.[3-5] Since publication of our paper, "Q Fever. Complement-Fixing Antibodies with *C. burnetii* Antigens in Various Geographic Areas and Occupational Groups in the United States," which appeared in the *American Journal of Public Health* (39:492, (Apr.), 1949), it has been called to our attention [6] that these two strains differ significantly in their immunologic properties. Subsequently, Dr. Herald R. Cox [7] has stated that, "On the basis of quantitative complement-fixation studies it has been conclusively demonstrated that the Dyer and Nine-Mile strains are not similar in respect to their serological sensitivity and specificity, and that both Nine-Mile American and Henzerling Italian are much more sensitive than the Dyer American; also, that there is no essential difference between the Nine-Mile and Henzerling strains in this respect." These observations have been confirmed by Smadel and his associates.[7] We are informed that these data are to appear shortly in the *Journal of Immunology*.[8]

In view of the foregoing, it should be emphasized that the serologic studies reported by us in the April, 1949, issue of the *American Journal of Public Health* were performed entirely with complement-fixing antigen prepared with the Nine-Mile strain. This is also true of the serologic studies carried out in connection with the Amarillo epidemic.[9, 10] The implication in our paper that "an even greater number of sera would have fixed complement had the Henzerling strain been employed" is consequently unwarranted.

Clearing House on Public Health Salary Information and Personnel Needs

RAINBOW OF RECRUITMENT PAMPHLETS

Public Health—A Career With a Future has gone through two editions. Now its children—*Careers With A Future*—have begun to appear on the scene. The first two arrived in May and are called respectively *Industrial Hygiene* and the *Engineer and Sanitarian in Public Health. Industrial Hygiene* includes the industrial physician, nurse, engineer, and chemist. For each of the six jobs there are a brief description of the job, the requirements, employment opportunities, salary ranges, and training facilities.

The pamphlets are prepared under the supervision of A.P.H.A.'s Committee on Professional Education which is distributing them. They are brief, attractively produced in various colors and carry a reproduction of the Association's Seal on the cover. When and if all are published—the if depending on money to pay the printer—they will be a rainbow of colors, at the end of which it is the hope that there will be a pot of golden recruits.

A FILM FOR RECRUITMENT

"Journey into Medicine" (See *A.J.P.H.*, 39:7 (July), 1949) is a film originally prepared for the United States Department of State for showings outside of the United States only. It has now been released for showing in this country. It is an appealing story of the lad who went to medical school, became a pediatrician in order to get at early causes of ill health, and then found he needed to go even further back to get at prevention, and became a public health physician.

The regional offices of the U. S. Public Health Service have copies for loan. It can be purchased from Castle Films, 30 Rockefeller Plaza, New York 20, $46.84 with a 10 per cent discount for non-profit agencies. This film will be shown as a part of the film program at the A.P.H.A. Annual Meeting in October.

MUNICIPAL PAY RATE TREND UP

The International City Managers Association has made a survey of pay rates for 20 common municipal jobs, largely semiskilled or clerical, in 99 cities, from which it concludes that "cities that granted pay increases in 1948 generally raised all salaries and not just those of certain jobs." For 15 of the jobs there were increases in more than 80 per cent of the cities; four jobs in between 75 and 80 per cent. Although, except for some clerical workers, these are not public health workers, nevertheless the study might be useful, at least for the cities included, as an evidence of the "signs of the time" in the community. Pay Rates for Selected City Jobs in January, 1949, International City Manager's Association, 1313 E. 60th St., Chicago 37. The study is not available for general distribution but the Mayor's office will probably have it.

CATCHING THEM YOUNG

The National Organization for Public Health Nursing has an Advisory Committee on Vocational Counseling, whose chairman is Ruth E. Rives, who is the assistant director of public health nursing in the New York State Department of Health. This committee, in the apparent belief that practising public health nurses have an opportunity—and a responsibility—to guide youngsters into the profession, has recently sent the following letter to N.O.P.H.N.'s member

agencies, to its state associations, to directors of university programs of study and state divisions of public health nursing, and, for information, to state nurses' associations:

As this letter is written there are hundreds of unfilled openings for public health nurses in the United States. The shortage of public health nurses has reached a dangerous point. Budgeted positions are crossed off budgets, services are curtailed, and essential services are not rendered in many localities. The standard of one public health nurse for 5,000 population except where bedside nursing is included in the generalized program—where one nurse for 2,000 population is recommended—has become highly unrealistic in the majority of communities.

The Joint Committee on Careers is not financially in position at this time to recruit for any of the special services, including public health nursing. Individual public health nurses can help with recruitment for their field. They are strategically placed: in the homes where they meet young people and their parents, in the schools where they may discuss nursing with teachers, counselors, and students, and in many community group activities which are rich sources for recruitment.

Agencies might consider offering the services of selected qualified staff nurses as vocational counselors to student nurse groups. These counselors, who should be particularly enthusiastic about public health nursing, might function in a big sister capacity to one, a few, or a large group of students. They might participate in professional adjustments classes. The objective of this "sistering" is the recruitment of desirable candidates into our special field.

This big sister plan may be transferred to high school groups, also, with the aim of recruiting for basic nursing preparation. Of course this plan should be discussed and carried out jointly with other community groups working on recruitment.

Does this appeal to you? Do you have any other ideas to share? Can the N.O.P.H.N. Advisory Committee on Vocational Counseling help you with your plans for the promotion of recruitment for nursing and for public health nursing? We should like to hear from you.

How about the Association of State and Territorial Health Officers, of State Laboratory Directors, the Conference of Municipal Public Health Engineers, and similar bodies developing some type of grass roots recruitment program?

ANOTHER NURSE RECRUITMENT PLAN

The New York City Department of Health has presented to the Budget Director a plan to fill vacancies for public health nurses, 326 now in the department's employ. The plan, endorsed by medical, nursing, and public health leaders calls for increasing the starting salaries of public health nurses from $2,400 to $3,000 a year, including the city cost of living bonus, and graduate nurses meeting public health nursing requirements would receive an increase of $600 a year. About 125 trainees would be accepted annually for an orientation program followed by university training at the city's expense, the educational program to be modeled after that of the New York State Department of Health.

GEORGIA LURES NURSES

The 1947 report of the Georgia State Health Department has just come to hand. The Division of Nursing has an interesting nurse recruitment page that might well be used as a poster with which to plaster the roadside fence posts, as well as the more formal bulletin boards in nursing and other schools. It's a drawing of a nurse (of course she's attractive); a caption that says, "Greater Salaries for Georgia Public Health Nurse!"; the former and current pay scale for three grades of public health nurses showing from 10 to 15 per cent rise; and the address of the Nursing Division. Incidentally, the Georgia Health Department has revised its "A Career in Public Health Nursing" to include, in response to many requests, a description of some of the activities of the public health nurse, and is accordingly called, "Services of Public Health Nurses in Georgia."

SCHOOLS OF PUBLIC HEALTH ACCREDITED FOR 1949-1950

The Executive Board of the American Public Health Association, on May 25, 1949, acted favorably on the recommendations concerning accreditation of schools of public health submitted by the Committee on Professional Education. The Executive Board voted to reaccredit 10 schools for the degree Master of Public Health (M.P.H. in the United States; the equivalent degree of the University of Toronto is the Diploma of Public Health, or D.P.H.). Eight of these institutions were also accredited for the degree of Doctor of Public Health (Dr.P.H.). Tulane University, for the first time this year is accredited for the Dr.P.H. degree in addition to the M.P.H. degree.

A new step in the accreditation program of the American Public Health Association (announced in the *American Journal of Public Health*, April, 1949, p. 535) now also provides for accreditation of Master's degrees other than the M.P.H. with specialization in the field of public health education. This type of accreditation is limited to institutions with schools of public health already accredited for the M.P.H. degree. Five of the 10 schools of public health accredited for the M.P.H. degree applied and were accredited for Master's degrees other than the M.P.H. with specialization in public health education. The kind of Master's degree granted varies with the overall structure of the individual graduate school. At the University of Toronto the equivalent of such a Master's degree is the Certificate in Public Health (health education).

Below are listed the schools accredited for 1949–1950, the types of degrees for which they are accredited, and the names of the deans or directors:

INSTITUTIONS ACCREDITED BY THE AMERICAN PUBLIC HEALTH ASSOCIATION FOR THE ACADEMIC YEAR 1949–1950

Institution	*Degrees Accredited*		
	Master of Public Health (M.P.H.) *	*Doctor of Public Health (Dr. P.H.)*	*Master's Degree other than the M.P.H.† in Public Health Education*
California, University of School of Public Health Berkeley 4, Calif. E. S. Rogers, M.D., Dean	x	x	
Columbia University School of Public Health New York 32, N. Y. H. W. Brown, M.D., Acting Director	x	x	
Harvard University School of Public Health Boston 15, Mass. J. S. Simmons, M.D., Dean	x	x	
Johns Hopkins University School of Hygiene and Public Health Baltimore 5, Md. E. L. Stebbins, M.D., Director	x	x	
Michigan, University of School of Public Health Ann Arbor, Mich. H. F. Vaughan, Dr.P.H., Dean	x	x	
Minnesota, University of School of Public Health Minneapolis 14, Minn. G. W. Anderson, M.D., Director	x		x

INSTITUTIONS ACCREDITED BY THE AMERICAN PUBLIC HEALTH ASSOCIATION FOR THE ACADEMIC YEAR 1949–1950 (Cont.)

Institution	*Degrees Accredited*		
	Master of Public Health (M.P.H.) *	*Doctor of Public Health (Dr. P.H.)*	*Master's Degree other than the M.P.H.† in Public Health Education*
North Carolina, University of School of Public Health Chapel Hill, N. C. E. G. McGavran, M.D., Dean	x	x	x
Toronto, University of School of Hygiene Toronto 5, Ontario, Canada R. D. Defries, M.D., Director	x		x

* Diploma in Public Health, D.P.H. at the University of Toronto
† Certificate in Public Health, C.P.H. at the University of Toronto

Credit Lines

A RURAL COUNTY SURVEYS ITSELF

A survey of Columbiana County, Ohio, entitled, "You and Your Neighbor" has been published by the agricultural extension service of the Ohio State University. The study was based upon interviews with citizens by citizens, 317 persons interviewed 4,789 rural families comprising 16,790 individuals. They found inadequate protection against diphtheria, whooping cough, and smallpox, and made suitable recommendations. With respect to tuberculosis a single tuberculosis program and a single health department for the entire county were recommended. Water supply, sewage disposal, brucellosis, and dental care were all surveyed with recommendations.

The Rural Health Council planned and conducted the study to secure a maximum of local involvement in finding and correcting existing health problems. Twenty township survey chairmen helped to make the survey possible.

Columbiana County has not been standing still. In 1949 it has secured a health center for its county health department, stepped up its tuberculosis program with a medical director, three nurses, and new clinic facilities. It secured a full-time health commissioner after a technical survey by the field staff of the A.P.H.A. in 1947. The county health department serves less than half of the county's population of nearly 100,000. Four cities of 10,000 or more, only one of which has more than 25,000 inhabitants, each has a part-time health officer.

Included is the long-range program adopted after the survey, listing 21 items and, in a corresponding column, the agencies that have accepted responsibility for each item. This list of agencies for the various items is in itself a text on local coöperation. The study is an outstanding example of the use of the survey technique for getting action as well as of community participation in community programs.

Available from Agricultural Extension Service, Ohio State University, Columbus.

OHIO LOOKS AT ITS PUBLIC HEALTH

There have been a number of recent evidences that public health in Ohio is having a rebirth. *Ohio CAN Have Better Public Health Service,* by the Ohio Committee on Public Health, may be cause or effect. At any rate, it is an excellent brief, yet detailed summary of what Ohio citizens need to do to bring their state's public health services up to a standard consonant with the state's wealth, population, and industrial and educational importance.

There are 10 conclusions that mince no words about the shortcomings of the State Health Department, particularly the serious lack of funds appropriated for its work. Its chief recommendations are for sufficient appropriations to carry on an adequate state program without federal funds for essential state services. These latter funds should be used largely for local health services.

The Ohio Public Health Committee, stimulated by the Rural Health Council, was organized early in 1948. It is made up of representatives of 12 organizations, medical, health, farm, labor, and civic. It has begun a second study that will concern itself with the administration and quality and efficiency of local health departments.

The report is succinct and forceful. The study is notable in that it used readily available basic data. It drew on

detailed material of previous studies, permitting its prompt completion at low cost.

UNIQUE CANCER EDUCATION

As briefly described in a previous issue of the *Journal* (July, 1948, p. 1017), the New York City Cancer Committee, for the past 7 years has sponsored annual contests for exhibits and posters in New York City high schools. The 1949 exhibit containing nearly 550 exhibits and posters was again shown in the Museum of Natural History. The exhibits, carefully prepared, were based on sound principles and reliable scientific information. Many of the posters were comparable to the best professionally prepared material and represented the individual expression of various types of talents.

There is no better way to disseminate health information that will "stick" for a lifetime than to stimulate young people to work on projects concerned with a particular problem. This New York City Cancer Contest is an excellent example of stimulating teachers and children to use their creative abilities in an interesting and worth while project. The value of "incidental" learning by relatives and friends is an additional asset.

Nor should the fact be overlooked that a goodly number of the participants through the interest developed in cancer and other health problems might become worthy recruits for the health field.

SHARING HOSPITAL NEWS

To pass on news about its member hospitals, the American Hospital Association in June began a two page monthly *News Service* to be distributed to all its members. It is designed to contain short news stories than can be used in local or state hospitals' journals. Among the items in Vol. 1, No. 1, is the announcement of a comprehensive five year *Cumulative Index of Current Hospital Literature* to be ready for subscribers early in 1950. American Hospital Association, 18 E. Division St., Chicago 10.

"ATTITUDES" AND DENTAL CARE

Following the modern psychological trend of taking account of basic attitudes and motivation in getting individual or mass action, a study of "Parental Attitudes and Dental Care for Children" has been made in selected rural areas of Louisiana. As one might expect, children whose parents were aware of the importance of dental care got more dental care than others. The study nevertheless is an illustration of a fertile field in health work, namely that "attitudes" as well as facilities have a good deal to do with health habits. The study was discussed at the recent meeting of the Southern Branch A.P.H.A. in Dallas. It was made by two members of Louisiana State University's Department of Rural Sociology and published with the coöperation of the Louisiana State Health Department, New Orleans, from which it is presumably available.

BREMERTON'S HEALTH COUNCIL DAY

The Kitsap County Community Health Council last April celebrated Washington State's first "Health Council Day." It invited leaders of the 10 community health councils in the state to Bremerton for a day of discussion and exchange of information. The Bremerton-Kitsap County Health Officer, Shirley Benham, M.D., spoke on the work and objectives of community health councils. Also explored was the question of organizing a Washington Association of Health Councils.

HOW TO GET SPEAKERS ON HEALTH

The Minneapolis Health Department, through its bureau of health information, has prepared a five page mimeographed list of topics for talks on health and the eight local agencies that provide speakers for the topics listed, including often films or other visual aids. This is a serv-

ice that might well be copied elsewhere. Minneapolis Health Department, 401 City Hall.

LAUGHING AND LEARNING

Doc Snork and Mrs. Snork and Maybelle and little Reginald, portrayed in a few pencil drawings, are sure to make the kids laugh. They decorate the "Doc Snork" letters which remind children about vaccination, about lice, about good nutritious meals, and all the other matters that health educators try to get over to children in one unique way or another. You may be sure the kids will take the letters home where "none of those pop and hot dog lunches for the little Snorks" will also have its effect.

The Division of Health, Department of Public Welfare, Dayton, Ohio, which puts out these letters, offers to share experience with other agencies that might wish to use a similar idea. The health educator, George W. Watson, says "Only by pooling resources can we ever hope to advance and since this little device has met with remarkable success here others might derive benefit from it also."

A FIRST DIRECTORY

The Illinois Public Health Association has recently published a directory of its more than 600 members, about three-quarters of whom are also A.P.H.A. members. Both job and home addresses as well as A.P.H.A. membership are indicated. This is believed to be the first directory to be published by a state or regional public health association. It has one serious omission; neither the I.P.H.A. officers nor a brief description of the organization are included. Hence if you want to congratulate the Association or see its directory, you'll have to find its officers and address elsewhere.

WHY PATIENTS LEAVE TUBERCULOSIS HOSPITALS

At the recent March annual meeting of the New York Tuberculosis and Health Association a study, based on nearly 2,000 discharged patients in four metropolitan tuberculosis hospitals, was released, analyzing the reasons why patients in tuberculosis hospitals leave against medical advice. Nearly half of those discharged alive left against medical advice. Two thirds of these "sign outs" were reported due to dissatisfaction with the institution. This is a study that should be in the hands not only of tuberculosis hospital administrators but also of case workers and others dealing with the family of the tuberculous patient. The report is the work of Godias J. Drolet, statistician of the Association, and his associate, Donald E. Porter, New York Tuberculosis and Health Association, 386 Fourth Ave., New York 16.

MULTIPLE SCLEROSIS APPEAL

The National Multiple Sclerosis Society has published a very brief but effective appeal for funds for its work. It is a good piece of health education in helping the public to understand some of the implications of the disease and particularly the need for further research to increase the body of definitive knowledge about it. National Multiple Sclerosis Society, 2 East 103 St., New York 29.

MONTREAL'S HEALTH DISTRICTS

A recent *Health Bulletin* of the Montreal Department of Health (Vol. 35, No. 2, Mar.-Apr., 1949) is devoted to a description of Montreal's health districts, eight of which are now in existence and a ninth planned. Each will serve from 100,000 to 150,000 persons. The health centers "greatest claim to usefulness," according to the description, is that it constitutes "a small department of health which has abandoned the high altitudes of administration to mingle with the people."

There is also a historical note on

health districts in a large city which cites the East Harlem and Bellevue-Yorkville Districts in New York, the North End district of Boston, and the Eastern Health District of Baltimore, as forerunners of the present accepted district plan of administration.

It might be noted in passing that the districting of large cities into subcenters and the consolidation of small cities and counties or of several counties into one administrative unit are two sides of the same shield—namely dealing with units of population that can justify and support an adequate service and that are yet manageable, with administration close enough to the people not to become too routinized and formalized.

HOW GOES PIERRE THE PELICAN

The *Journal* of May, 1948 (p. 721) described briefly the Pierre the Pelican series of the Louisiana Society for Mental Health. The series is sent once a month for a year to the parents of a new-born baby, and is designed to help the parents in avoiding pitfalls in the early training, particularly of the first born. The first year's experience has now been evaluated and reported on in *Louisiana Mental Health Studies*, No. 1, November, 1948, under the direction of Loyd W. Rowland and a group of his students at the Tulane Graduate School of Social Work. There is a page and a half of text for the layman giving the major highlights and all tending to indicate that Pierre the Pelican families do a better job of handling the routine of child care than non-Pelican families. There is a much longer evaluation analysis for the professional—and parent who wishes to read.

The series has also been used in West Virginia through the coöperation of the West Virginia Bureau of Mental Hygiene and the Division of Vital Statistics. The Louisiana Society has prepared a brief report of West Virginia's method of distributing the Pelican pamphlets.

All this material is available from the Louisiana Society, 816 Hibernia Bldg., New Orleans 12.

A TUBERCULOSIS SOCIETY BULLETIN CONCENTRATES ON LOCAL HEALTH UNITS

It will be remembered that the National Tuberculosis Association has on more than one occasion passed resolutions that adequate organized local health services were indispensable to the most effective operation of local tuberculosis control programs. Its program development has found numerous ways of passing the intent of these resolutions on to state and local affiliates.

That the Massachusetts Tuberculosis and Health League is in full accord with its parent organization is indicated by the April issue of its organ, *The Massachusetts Health Journal.* This issue is devoted mainly to consideration of local health units as a means of bringing better public health to Massachusetts. It has a message from the Governor urging the union of towns, the report of Hugh R. Leavell, M.D., Chairman of the Technical Committee on Local Health Units of the Special Commission on Public Health, which outlines a plan for local health units in Massachusetts, articles by both Dr. Vlado A. Getting, the Health Commissioner, and Dr. Robert E. Archibald, Director of Local Health Administration, and by C. W. Kammeier, the Executive Director of the Massachusetts Tuberculosis and Health League. Nor are rural health problems neglected, for a solution such as is reported by the Nashoba Associated Boards of Health, is fully described. Although geared to the Massachusetts situation, the articles have a good deal of relevance for other states as well. Massachusetts Tuberculosis and Health League, 1148 Little Building. Boston 16.

TAKING RESOLUTIONS SERIOUSLY

The *Crusader* of the Wisconsin Anti-

tuberculosis Association has been giving tangible reality to the resolutions of its parent organization, the National Tuberculosis Association, that local and state health departments are indispensable to most effective tuberculosis control activities.

The March issue described the State Board of Health and some of its chief activities. The April issue was devoted to the work of local health departments. It included a map of the state showing the 71 counties districted into 37 proposed health units, 15 made up of single counties, and 22 of two, three, or five counties. The *Crusader* has a mailing list of about 20,000 Wisconsin citizens who have thus had "a sampler of what the state's official health agency is doing."

FACING ACCIDENT FIGURES FRANKLY

The Oregon State Health Department has studied its accident figures. It has published them, not in a handsome printing job with extensive statistical tables. Rather, it has used one page of its weekly *Health Bulletin* for an article entitled "1948 Accident Record Among Nation's Worst." The article reports that only 6 states had worse accidental death rates, that motor vehicle accidents were the most frequent, and that at least 50 per cent of the accidents could have been prevented. Included in bold type are a few simple safety measures recommended by the State Health Officer, Harold M. Erickson, M.D. Also in bold type is a summary of January, 1949, figures indicating a more favorable situation than the previous year. This type of treatment has its advantages—and its economies—over the more extensive handsomely produced report.

CANCER LEGISLATION IN STATES

Cancer News for February, 1949 (Vol. 3, No. 2), in "Thirty States Have Cancer Legislation" gives a brief history of state cancer legislation. The first was an item in the supply bill in New York in 1898, "for the medical department of the University of Buffalo for the equipment and maintenance of a laboratory to be devoted to an investigation into the causes, nature, mortality rate, and treatment of cancer, and the salaries and officials of the same, ten thousand dollars." Massachusetts followed in 1919, since when 28 other states, the District of Columbia, and Puerto Rico have made some official provision for the control of cancer. In 12 states these laws provide for some type of permanent cancer control program in the state health department, in some there is provision for such a program under the auspices of the state university. Five states make cancer a reportable disease by law, 21 others by health department regulation. *Cancer News* is published by the American Cancer Society, 4 Beaver St., New York 4.

A DRAMATIC DEMONSTRATION

The Shelby-Effingham Bicounty Health Department in Illinois is hardly more than a year old. But it had an opportunity to dramatize its value to the community following the St. Anthony's Hospital fire in Effingham in April. Not only were there 75 deaths but there was a general disruption of medical, obstetric, and surgical services within the area. Following requests for home nursing aid in child birth cases that had been scheduled for the destroyed hospital, the health department nursing services were put on an emergency basis. Within 24 hours three home deliveries had received health department nursing aid.

Out of this grew an interim plan of home nursing delivery service with three additional nurses employed by the county and a number of others put on to be paid on a fee basis. A state grant-in-aid has made this program possible. The news release distributed by the director of the health department, Fred O. Tonney, M.D., says, "This incident

gives us a new conception of what a local health department can mean to a community over and above the presently accepted routine services—a matter which deserves thoughtful consideration for the future planning of the national public health program."

SAFETY MATERIALS

The business of making the public, particularly the younger generation, safety conscious does not slacken its pace. The National Commission on Safety Education of the National Education Association has a quartet of recent publications. They are:

1948 Annual Report which includes a 1948 bibliography of the Commission's Safety publications, and their prices.

Highway Safety: A Challenge to Youth—Designed to help teachers of upper elementary grade integrate traffic safety with social studies program, 30¢.

Minimum Standards for School Buses, 1948 Revised Edition and Standards, 35 cents, and *Training Programs for School Bus Drivers,* 30 cents. Both Bulletins were developed by the October, 1948, National Conference on School Transportation at which 44 state departments of education were represented. For all three publications there is a reduction up to one-third for quantity orders. National Education Association, 1201 Sixteenth St., N.W., Washington 6.

Also out is the *Program Package for Home Safety* of the National Safety Council's Home Safety Conference. This contains instructions and a variety of material for the organization of community home safety programs. The kit is $1, but if ordered with two other dollar items, annual subscription to the *Newsletter* and another to the *Home Safety Review,* all three can be had for $2. National Safety Council, 20 N. Wacker Drive, Chicago 6.

HOW ACCIDENTS HAPPEN

A detailed, interesting, and revealing analysis of home accidental injuries and deaths in Atlanta during 1948 was written by Charles Gaddis of the Atlanta Chapter of American Red Cross. He had the help of Atlanta's hospitals and The Bureau of Vital Statistics in its preparation. Among its significant findings is, "Children up to four years of age were the most frequently injured, suffering more falls than any other group."

The study is to be found in *Home Safety Review,* Apr.-May, 1949, published by the National Safety Council, 20 N. Wacker Drive, Chicago 6.

UTAH'S MERIT SYSTEM

The habit of reporting on Merit Systems grows. The report of Utah's Merit System for the year ending June 30, 1948, with illustrations and simple language, tells of the advantages of the Merit System and implies that all workers should be under it instead of only the one-fifth of the nearly 5,000 total state employees who are in the four departments covered—health, public welfare, employment security, and highway patrol. Merit System Council, 428 Atlas Bldg., Salt Lake City.

WORTH ACQUIRING

My Story is a 38 page magazine-like publication that looks like one of the popular women's magazines. Its several love stories of the confession type, as well as the advertisements, cross word puzzles and other facilities, have a VD message woven into them. And, of course, they all have a happy ending. It is intended particularly for widespread distribution in industry, clubs, and lounging rooms.

The magazine was prepared in coöperation with the U. S. Public Health Service by Health Publications Institute, 216 North Dawson St., Raleigh, N. C., from whom it is available at $25 per 100; $200 per 1,000, with an additional 10 and 25 per cent discount respectively for 5.000 or 10,000 copies.

The Nurse and Planned Parenthood, written by four nurses is a brief discussion of the factors in family planning. The aims and importance of Planned Parenthood are intepreted for the nurse to aid her in taking her full share of responsibility in carrying out the program under appropriate medical supervision. Planned Parenthood Federation of America, 501 Madison Avenue, New York 22, 10 cents or $6 per 100.

Boys Want to Know is the fourth in a series of pamphlets dealing with questions and problems of boys and girls of various ages. Published by the New York Tuberculosis and Health Association, 386 Fourth Ave., New York 16, to whom queries should be addressed.

You Will Want to Know is a brief 8 page summary, with pictures and in color, telling of the activities of the 63 year old Public Health Laboratory of the Kansas State Board of Health. It is geared to the theme "Why We Need a Building." Kansas State Board of Health, Topeka.

Discipline is the newest in the Parent-Teacher Series being edited by Ruth Cunningham for the Columbia University Teacher's College Bureau of Publications. Its subtitle might well be "Comfortable Discipline." It has many hints for maintaining discipline without at the same time creating mental hygiene problems, 60 cents.

ANNUAL REPORTS

The 1947–48 report of the Richmond, Virginia, Health Department is called "The Future is Now." It is an excellent illustration of making what are often dull facts come alive for the average reader. Simple line drawings, sometimes a bit humorous, a minimum of wordage and some real accomplishments to report, and a reminder of the need for citizen support—these are the elements in a simple job, expertly done. The report, incidentally, was introduced to a public outside the state at the recent meeting of the Southern Branch of the A.P.H.A.

Kay County's Health: Then and Now is a very short annual report of this Oklahoma County's health service based on a comparison between two 4 year periods 1936–1940 and 1944–1948. Effective use is made of graphic material to tell the story and sandwich in a bit of health education besides.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted.

Fetal and Neonatal Death—*Revised and brought completely up to date, with new sections on the Rh factor and the effect of maternal German measles on the fetus*—*By Edith L. Potter, M.D., and Fred L. Adair, M.D. Chicago: University of Chicago Press,* 1949. 167 pp. Price, $3.75.

This edition like the first, reviews the present status of knowledge of development and organ structure of the normal fetus and new-born infant, the technique and scope of the post-mortem examination for the fetus and new-born infant, the principal causes of fetal and neonatal death, the special pathology of the various systems of the body in the fetus and new-born, and statistical data.

The most outstanding developments in knowledge during the nine years spanned between the two editions—the discovery of the Rh factor and its relationship to erythroblastosis in the fetus and new-born infant, and the gradual accumulation of evidence that virus infections occurring during the first few months of pregnancy may cause death or malformation of the embryo, are covered in this new edition.

During the same period there has been a significant decrease in fetal and neonatal mortality. This edition calls attention to the fact that between 1937 and 1945 the combined rates for stillbirths and neonatal deaths per 1,000 live births in the United States have dropped from 66 to 48, and that in certain obstetric hospitals the mortality today is below the hypothetical irreducible minimum of a few years ago. The statistical data in the last chapter give corroborating evidence of this fact as well as other interesting and significant data from the Chicago Lying-In Hospital. A discussion of maternal mortality not included in the first edition is incorporated in this edition, as is a discussion of the close interrelationship of the problems of maternal, fetal, and neonatal mortality. ELLA OPPENHEIMER

The Shame of the States—*By Albert Deutsch. New York: Harcourt, Brace,* 1948. 188 pp. Price, $3.00.

Deutsch attempts to rouse the conscience of the American people to the shocking conditions present in most of their state mental hospitals. He describes the overcrowding, understaffing, inadequate budgetary allotments, lack of adequate treatment facilities, etc., that exist in state mental hospitals throughout the country.

The history of the development of the state mental hospital is outlined, and responsibility for its present sad plight is attributed to the apathetic attitude of the average citizen. Deutsch has faith in the conscience of the American people and believes that, the facts being known, most Americans will press for needed changes and willingly tax themselves sufficiently, to eradicate this "Shame of the States."

Certainly, changes in the care of the mentally ill are long overdue. *Every general hospital* must enlarge its local function of giving comprehensive medical care by adding an acute *psychiatric service* with related outpatient clinic for the diagnosis and early treatment of behavior and maladjustment problems of adults and children. One wishes Deutsch had included and stressed this most important recommendation as a part of his plan to improve the care of the mentally ill in America.

This book should be required reading in our schools and colleges. Also, every public spirited legislator would more clearly see the urgent need to direct public funds into the field of preventive

mental health—if he took time to learn the shocking facts, briefly outlined in this small, well written volume.

S. BERNARD WORTIS

School Health Education—*By Delbert Oberteuffer. New York: Harper,* 1949. 393 pp. Price, $3.25.

School Health Education covers very adequately and systematically the current situation and problems in the school health field. It brings together under one cover a review of the various fundamental principles, beliefs, and trends concerning school health work; specific suggestions on programs and activities; and references to the facilities and resources available. It is a well organized, carefully thought through summary of school health problems and the various ways of approaching them, fitting them into their logical relationship to public health education and the practice of medicine.

The sections on classroom teaching, course organization and content and evaluation explain school health education in the light of basic principles of good education. These specific suggestions are based on the needs and interests of individual children, and are selected to affect the behavior and attitudes of the individual and to foster his well rounded and balanced growth. The material is fitted into its proper place in the curriculum, and is particularly helpful in the explanation and illustration of the integrated health teaching program and experience.

The business of health appraisal in schools is carefully outlined and should help to clarify the many questions raised with regard to what functions should be developed—how, why, and by whom. Specific programs relating to communicable disease control, mental hygiene, nutrition, dental health, vision, hearing, environment, physical education, the special problems of the handicapped, and emergency care are all clearly reviewed. Recognition of the importance of professional preparation is given but is reviewed in less detail; however, the many references are well selected and organized.

One full chapter is given over to the important interrelationships of school and community personnel. Without clarification of these administrative and personnel lines of endeavor and without coöperation action, no school health program can function adequately.

The objectives of school health education are clearly presented in this book and the outlines and suggestions will be of value to all students of school health in teaching, medical, nursing, or other related professional fields. Whether or not one agrees with the specifics within the book, the reader will obtain a splendid overall point of view of the purposes of school health programs and the various procedures required to fulfil them. This is done in a simple, clear manner with good definitions of both education and public health terms. Dr. Oberteuffer is a clear thinker and has prepared a sound reference book which makes a real contribution to the literature in the field.

GEORGE M. WHEATLEY

How to Tell Your Child About Sex—*Public Affairs Pamphlet No. 149 —By James L. Hymes, Jr. New York: Public Affairs Committee, Inc.,* 1949. 31 pp. Price, $0.20.

Mr. Hymes is Professor of Education and Coordinator of Early Childhood Education at the State Teachers College, New Paltz, N. Y. His article maintains the high standards that have characterized Public Affairs Committee, Inc., publications.

Among the many pamphlets intended to be of assistance to parents in answering children's questions about reproduction, this may be recommended as one of the best. The printed word ordinarily is not an effective means of communicating through the barriers of

already established attitudes that characterize parents' feelings about sex unless the author uses suitable devices for establishing good feeling and reassurance about the subject and avoids creating further emotional difficulties. This is not easy and the special value of this publication lies in the author's success in this respect. In addition to providing simple suggestions for answering children's questions, the pamphlet makes it clear that the important part of the child's "sex education" is derived from parental attitudes, feelings, and conduct. This reviewer feels satisfied with all the suggested answers except the explanation of menstruation. In essence it is suggested that to the child a satisfying explanation is that some accumulated blood containing food for a baby that did not materialize is discharged each month. Aside from the question of its accuracy, this explanation might harbor unsuspected meanings for a child. ADOLPH WEINZIRL

Mayo Clinic Diet Manual—*By the Committee on Dietetics of the Mayo Clinic. Philadelphia: Saunders,* 1949. 329 pp. Price, $4.00.

The tables and procedures presented in this book give a wide range of information which reflects current practices in therapeutic diets. The material was developed for use as well as for teaching purposes and represents "convergent trends but not unanimity of opinion" of the physicians of the Mayo Clinic.

The format, alternate blank pages for notes, should greatly enhance usefulness. Each diet is presented in a single table. These simple and legible tables should facilitate rapid referral and ready reference.

It is unfortunate that the book was in press when the 1948 revision of *Recommended Dietary Allowances* of the Food and Nutrition Board of the National Research Council was published, because all the diets are calculated to conform strictly to the 1945 recommended dietary allowances, and wherever there occurs a divergence from these allowances, the deviation is plainly stated. The authors feel that for practical purposes the dietary allowances were changed so little that this does not create a serious defect.

Many useful data are included: among them are tables of food high in cholesterol, sodium, oxalic acid, iron and calcium, age-height-weight tables, as well as a food nomogram. There is a detailed table of contents, but no index.

This book would be a valuable addition to the working library of dietitians, physicians, nutritionists, and nurses.

MARGARET C. MOORE

Safeguarding Motherhood—*By Sol T. DeLee, M.D. Philadelphia: Lippincott,* 1949. 123 pp. Price, $2.00.

Safeguarding Motherhood is a study in contradiction which, to say the least, would be confusing to the expectant mother for whom the book is intended. He tells the mother, "The prospective mother should take cheerfulness as her motto. Cheerfulness will work wonders for her, her baby, and her home. She should keep in mind the over-flowing happiness that a delightful, lively, rosy-cheeked baby will bring in a few months' time." But how can she be cheerful when the following pages are filled with such gloomy topics as nausea, vomiting, flatulence, cramps, piles, edema, mental unrest, chills and fever, toxemia, abortion, placenta previa, heart disease, thyroid disturbances and most of the other pathology known to medicine?

Dr. DeLee advises the mother to have confidence in herself, but the fears which are instilled can only make her cling more frantically to her doctor. He puts great stress upon the importance of the father-to-be, but then would ban him as a "visitor" from his wife during the latter stages of her labor.

He describes labor as "a perfectly natural function" and declares "It has been shown repeatedly that the well informed patient adopts the attitude that labor is not a horrifying experience but Nature's way of terminating the pregnancy. In the absence of fear this work can proceed more naturally and efficiently and with far less discomfort." Later on Dr. DeLee states that "Delivery is a surgical procedure."

Perhaps the central idea of the book is best epitomized by Dr. DeLee's selection of words. Most young women go to their doctor on the first prenatal visit hoping they are pregnant. But says DeLee, "In most cases the first prenatal visit paid to a doctor is one during which the patient expects to confirm her *suspicion* of pregnancy."

There is a crying need for a book on maternity and the relationship of the coming of a baby to the family, the doctor, nurse, hospital, and the community that emphasizes the importance of health, physical, mental and family health, and shows the way to achieve it.

HAZEL CORBIN

Social Medicine: Its Derivations and Objectives—*Edited by Iago Galdston, M.D. New York: Commonwealth Fund,* 1949. 293 pp. Price, $2.75.

Many of the 25 essays collected here are exceedingly interesting, although they are rather uneven and do not form an entirely consistent pattern. Subject matter varies from detailed contributions on nutrition to lofty philosophic discussion of "The World Scene."

Several lines of thought, however, thread through most of the papers: medicine must more and more consider the entire personality of the patient, especially his emotional and psychological life and his familial, occupational, and general social setting—indeed, his whole culture; more scientific studies are needed of all the factors, social and individual, that affect the health of a living population in its cultural pattern; preventive medicine should be the daily task of every physician—who will "spend his time keeping the fit fit rather than trying to make the unfit fit" (Lord Horder): physicians should be more active in efforts to improve such general conditions affecting health as nutrition, housing, family and social relationships; medical education must better prepare doctors to understand and alter emotional and social influences on health.

Several enthusiasts urge the naïve belief that social science, fully applied, can resolve the world's ills. Indeed, the book's major defect is that little attention is given to practical means for putting its admirable ideas into effect. Most would appear to require large-scale governmental action, yet this seems greatly feared by many of the authors.

DEAN A. CLARK

The Venereal Diseases—*By James Marshall. (2nd ed.) New York: Macmillan,* 1948. 369 pp. Price, $5.50.

This brief manual, described as "For Practitioners and Students" is chiefly interesting to Americans for the picture it provides of the British attitude toward developments of recent years in the therapy of the venereal diseases. The author is the Director of the Venereal Diseases Clinic of the Royal Northern Hospital in London, and has been Advisor in Venereology to the British War Office.

Of greatest interest is Dr. Marshall's advice that early syphilis be treated with daily injections of an arsenoxide over a 10 day period, in supplement to 2.4 million units of penicillin over a period of 7½ days. This distrust of penicillin alone in early syphilis is typical of the present British medical point of view, and depends, apparently, upon the experience in the British Army, where the failure rate with penicillin alone was held to be higher than in this country or the U. S. Army in Europe.

In various types of late syphilis, in pregnancy complicated by syphilis, and even in congenital syphilis, recommendations for the use of penicillin are qualified by the advice to supplement such therapy with the arsenicals and bismuth.

The author endorses the effectiveness of penicillin in gonorrhea, though he remains dubious concerning the effectiveness of the delayed absorption variety. There is a considerable discussion of the complications of this disease, and here the divergence from American practices is most evident. In stress upon use of sulfonamides, the passage of the urethral sound as a test of cure, potassium permanganate douches in salpingitis, and reliance upon the gonococcal complement-fixation test, the author presents views sharply different from those drawn in recent years on this side of the Atlantic.

Save as a source book for information on current British therapeutic practices in venereal disease, this manual would have little value to an American clinician or public health man. JAMES H. LADE

Rheumatic Fever: Nursing Care in Pictures—*By Sabra S. Sadler. Philadelphia: Lippincott,* 1949. 151 pp. Price, $3.50.

Occasionally a thoroughly practical, comprehensive, authoritative, clear, and simple set of instructions for nursing a special disease in the home appears. Mrs. Sadler has prepared such instructions in this book—practical even to the point of being bound to lie flat and cleanable with a damp cloth!

A description of rheumatic fever—its causes so far as we know them now, its symptoms, course and prognosis—precedes the nursing instructions, thus providing parents with an understanding of the reasons for giving care in a certain way. The book is written for parents, illustrated for parents, and contains so many procedures common to long-term sickness situations in the home that nurses will find it exceedingly useful for teaching purposes in a variety of conditions. The book ends on the cheerful note "Returning to Normal," and the final picture shows the recovered child keeping in touch with the doctor through periodic visits to his office.

This is altogether a highly satisfactory book to be recommended unreservedly to everyone having home contacts with rheumatic fever. Would there could be similar tools for the home care of such diseases as cancer, diabetes, and nephritis!

DOROTHY DEMING, R.N.

Maternity in Great Britain.—*Joint Committee of the Royal College of Obstetricians and Gynecologists, and the Population Investigation Committee. New York: Oxford University Press,* 1949. 252 pp. Price, $4.00.

This report of a survey of social and economic aspects of pregnancy and childbirth is probably more complete than any survey on this subject ever made before. It was undertaken and completed by the British Royal College of Obstetricians and Gynecologists, and the Population Investigation Committee, before the initiation of the new National Health Service. Major objectives were to study the extent to which existing maternity services, public and private, met the needs and desires of mothers, and to determine the costs of such services. Clinical aspects of maternity, although referred to, were secondary to the study of social and economic problems.

The study was based on personal interviews, eight weeks postpartum, by health visitors (most nearly comparable to our public health nurses), with 13,687 mothers delivered in England, Scotland, and Wales, during a given week in 1946. Interviews were satisfactorily completed for between 80 and 90 per cent of all deliveries occurring during this week. This was not too difficult, since 96 per

cent of the mothers in England receive postpartum visits by the health visitors.

The following are samples of the interesting data found in this study:

In 65 per cent of these homes, the number of occupants is greater than the number of rooms.

The stillbirth rate for the most prosperous family group was 24.0, and for the least prosperous group, 40.3.

The neonatal death rates for these two classes were, respectively, 18.9 and 30.1.

72 per cent of the mothers received antenatal care at the local public maternity centers, and visited the clinics on the average of eight times during the pregnancy.

Undesirable premises for many clinics, lack of appointment systems, and variations in the skills and interests of the attending physicians are described.

54 per cent of the deliveries occurred in hospitals, but priority for hospital care was not always given to those most in need of such services.

In spite of an acute shortage of beds, the hospital stay in England averaged 13 days, and in Scotland 10 days.

The main complaint of the mothers interviewed was, "No attempt was made to relieve labor pains."

Only 52 per cent of those delivered in hospitals were given any pain relief.

The survey reported that, "In all aspects of maternity care, well-to-do mothers get better attention than those who are poor." Factors underlying these social inequalities are discussed. Special mention is made of prematurity, infant feeding, problems of working mothers, and household help.

The study should have been extremely valuable to all of those in Great Britain concerned with development of the expanded National Health Service Act which became effective two years later. A similar study in the United States would undoubtedly result in producing a wealth of useful data in this important field. EDWIN F. DAILY

Social Surveys—*A Guide for Use in Local Planning. New York: Council of Jewish Federations and Welfare Funds,* 1949. 29 pp. Price, $.50.

The Council of Jewish Federations and Welfare Funds prepared this excellent short guide for a staff engaged in field surveys. It will be useful to communities considering such ventures. The approach to surveys as tools rather than as panaceas is well presented.

ROSCOE P. KANDLE

Trace Elements in Foods—*By G. W. Monier-Williams. New York: Wiley,* 1949. 511 pp. Price, $6.00.

From the title of this book one might expect to find merely extensive tables showing the distribution of trace elements in foods. On the contrary, it covers in a very interesting and complete manner the biochemistry, the nutritional significance, and the toxicology of over 30 trace elements. Of this group the author points out that six are essential for animal life and three more for plant life. A few others, such as selenium, occur spasmodically in plants and a good many gain access to food from industrial processing.

Each chapter is very complete with a selected group of important references. Much space (perhaps too much for many readers) is given to analytical methods for each of the elements. Emphasis is given to the public health aspects of many of the elements, especially copper. Less attention is given to selenium, probably because the problem is not so serious in England as it is in the United States.

The book is very valuable to workers in many fields and certainly everyone interested in public health should have the book available. As one would expect when a single author attempts to cover as extensive a field as trace elements, a few significant references are omitted and certain insignificant material is included. C. A. ELVEHJEM

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

Females and Infants Had the Best of It—If the death rate of 1940 had held in 1947, then 267,000 more people would have died than departed this world that year. All the leading causes of death, except cancer, played a part in the life saving. And the cancer increase was under 3 per cent, which may simply reflect better reporting. This study is something you will not want to miss.

ANON. The Fruits of Life Conservation. Stat. Bull. (Met. Life Ins. Co.) 30, 5:1 (May), 1949.

Broader-View Department—"Curiosity is often considered a bothersome trait which has got us into a great deal of trouble from the days of the Garden of Eden to Those of Hiroshima." "Against unfettered scientific curiosity there is now strong opposition." These two assertions should make you look up from your own little preoccupations long enough to read the whole paper.

BRONK, D. W. Science and Humanity. Science 109, 2837:477 (May 13), 1949.

Kippers, Pilchards, Swedes, *et al.*—What will men and women eat in 1960? asks this British researcher. Nobody knows because nobody has tried to find out! is his answer to his own question. Then he tells how he got some advance information by asking young workers, still in their teens, what they liked. Isn't there a nubbin of an idea there that may be worth importing?

CLARK, F. LE G. Food Ways of the Young Worker (two parts). M. Officer 81, 23:235 (June 4), 1949.

Cholesterol: Scientific Enigma—Does age 60 seem not too far away? Then this paper will tell you what you had better eat. Perhaps you will want to pass along the word to someone else nearer than you to old age. Mostly this paper is about calcium, iron, and protein, with a warning about cholesterol.

CRAMPTON, C. W. Dietary Aids and Dangers for the Aging. Pub. Health Nurs. 41, 6:320 (June), 1949.

Ominous Record—If you want to know where polio was most prevalent last year, here is the information. Both morbidity and mortality rates were highest in years. The west north central part of the country was hit hardest.

DAUER, C. C. Prevalence of Poliomyelitis in 1948. Pub. Health Rep. 64, 23:733 (June 10), 1949.

Despite Insufficient Funds and Nonexistent Personnel—Mental hygiene begins to take its place with other functions of a comprehensive health program in this Maryland County. The clinics will serve as centers of inservice training in the principles of mental health for *all* the departmental staffers.

DAVENS, E., AND LEMKAU, P. Birth of a Community Mental Health Clinic. Pub. Health Rep. 64, 21:657 (May 27), 1949.

News Item—Two manuals, one for public health nurses and the other for health officers, are in course of preparation by the National Cancer Institute and the New York State Department of Health. Watch for them! Lay pamphlets will soon be available too.

DEIBERT, A. V., *et al.* Professional Education for Cancer Control (and four related papers). Pub. Health Rep. 64, 24:749 (June 17), 1949.

Did You Know?—To sanitize means, "to apply measures to food handling equipment, eating and drinking

utensils, and the like, so as to reduce the bacterial count to safe levels . . ." I still think it a clumsy word.

DU BOIS, A. S. Meaning of the word "Sanitization." Mod. Sanitation. 1, 2:31 (June), 1949.

Anent Mental Impenetrability—Before and after a county-wide chest x-ray project, people were asked to tell what they knew about tuberculosis. As an educational medium the x-ray activity proved to be small potatoes. Some—mostly the younger ones—learned quite a little but the overall educational results were slim.

GALIHER, C. B., AND WRIGHT, J. E. What Does a Roentgenographic Survey Teach the Public? Am. Rev. Tuberc. 59, 5:494 (May), 1949.

It Can Be Done—In this case finding project every syphilis patient named at least one contact, most named two, one named eleven. Altogether 144 new cases were brought to light in a season's effort by three investigators.

GRAY, A. L., *et al.* Syphilis Contact Investigation in a Rural County in Mississippi. J. Ven. Dis. Inform. 30, 6:165 (June), 1949.

Noise vs. Hearing—Will noise drive you crazy? At least it menaces your health and destroys efficiency, says this subcommittee. It is a health hazard that no longer should be allowed to lie dormant, they insist.

GROVE, W. E. Will Noise Damage One's Hearing? J.A.M.A. 140, 8:674 (June 25), 1949.

From Aretaeus to Waksmann—Prize essays are frequently prize bores but this one isn't. Just to follow this (then) fourth-year-medical-student as she circumnavigates the entire sphere of preventive medicine, in six pages, is to be a witness to an epoch-making jet-plane flight.

MANNING, M. D. Preventive Medicine. New England J. Med. 240, 26:1047 (June 30), 1949.

Are These Your Questions, Too?—"Most of (the visitors') questions centered around the community relations of the (mental health) clinic—what agencies are worked with directly, both on a referral and a consultative basis; what were the extramural activities; what were the mechanisms of cooperation with the community agencies; . . . how can the interest and support of the community and local agencies be fostered?" Answers are given.

ROSS, M. Pilot Mental Health Clinic. Pub. Health Rep. 64, 25:799 (June 24), 1949.

Nation-wide Eradication Is Possible—Proof is here, if you need it, that community-wide vaccination of dogs is essential to canine rabies control: without it the other measures, no matter how strictly enforced, won't do the trick. There is a lot more to this paper about the Rabies Control Branch, V.P.H. Division.

STEELE, J. H., AND TIERKEL, E. S. Rabies Problems and Control. Pub. Health Rep. 64, 25:785 (June 24), 1949.

Neither by Itself Alone—Full-time, rural health services hold no threat to village V.N.S.'s. Each should strengthen the services of the other—in five ways that are discussed.

WINSLOW, A. R., AND WINSLOW, C.-E. A. District Health Unit and Voluntary Nursing Agency. Pub. Health Nurs. 41, 6:315 (June), 1949.

"Not a Cause for Complacency"—Whatever role diphtheria immunization may have played originally in reducing morbidity, it has precious little effect upon the immunity status of the present adult population, say these researchers. The current high percentage of Schick-positives among young men in the Navy is—see quotes above.

WORCESTER, J., AND CHEEVER, F. S. The Schick Status of 18,000 Young Male Adults. New England J. Med. 240, 24:954 (June 16), 1949.

Public Health in Foreign Periodicals

GEORGE ROSEN, M.D., PH.D.

CONCERN for the health of the industrial worker is no longer a matter merely of sentiment or humanitarianism. It has become a vital necessity in the calculations of any industrialized community. The relations of occupation and health have today been extended so that these include not alone patent disease states but all factors that have a bearing on the maintenance of industrial health.

PSYCHOMETRY AND THE PREVENTION OF OCCUPATIONAL ACCIDENTS

Bonnardel reports on the use of psychometric tests to determine accident prone workers.[1] In a previous communication he had pointed out the significance of a "concrete intelligence" factor in the occurrence of accidents among workers. The psychometric tests on which the present results are based were made when the workers were hired, and thus before accidents had taken place. Bonnardel believes that unquestionable importance must be attributed to such tests in any program designed to discover in advance a good proportion of those workers who are more prone to accidents.

The observations upon which these conclusions are based are as follows: In one group of workers who had three or more accidents in the course of 2½ years, 41 per cent of the work days lost (381 out of 934) were due to workers who had been classed in the lowest decile at the time of the preëmployment psychometric examination. The percentage of work days lost for persons in this group was six times higher than in the whole working population.

Out of 153 workers who had accidents during the first 6 months of their employment, 39 (25 per cent) had been classed in the lowest decile at the psychometric test.

Finally, Bonnardel reports the case of a group of North African workers employed in a foundry who had accidents during a 3 month period. Here the proportion between the number of accidents and the number of workers, for the different groups derived from the psychometric tests, ranged progressively from 14.4 per cent for the lowest group to 2.5 per cent for the highest groups.

SUPERVISION OF EMPLOYED MINORS IN STOCKHOLM

This paper presents results obtained from physical examinations of 1,477 employed minors in Stockholm.[2] These workers ranged from 13 to 18 years of age. The authors report that in the past 40 to 45 years the weight of workers in this group has increased by 10 to 15 kg. and their height by 10 to 15 cm. About 13 per cent of the group examined were found to have postural defects that required orthopedic treatment. Anomalies of refraction were found in some 7 per cent. The authors stress the great importance of finding and correcting refractive errors as a means of accident prevention. Hearing defects and dermatological findings were rare; and approximately 1 per cent were found to be suffering from cardiac conditions. Dental caries was present in almost everyone examined. In conclusion the authors stress the need for examinations oftener than once a year. The follow-up could be performed by a public health nurse.

SILICOSIS AMONG FERRO-SILICON AND FERRO-CHROMIUM WORKERS

Broch investigated the occurrence of

silicosis among workers in a plant where ferro-silicon was fused with ferro-chromium.[3] A considerable number of workers with silicosis was found. After 16 to 19 years of employment in the ferro-silicon furnace house, about half of 21 workers had definite silicosis. One worker who had worked for seven years at charging the ferro-silicon furnaces had silicosis, stage I. Broch points out that the workers who charge the ferro-silicon furnaces are especially exposed. Chemical analysis of dust from various spots in the ferro-silicon furnace house showed a silica content ranging from 48 per cent to more than 80 per cent. X-ray examination of the dust indicated that amorphous silica was the cause of silicosis. Investigations among the ferro-chromium workers showed no silicosis in those who had worked 10 to 13 years. Further studies are being made to substantiate these findings.

SANITARY DRAWBACKS IN SPRAY PAINTING AND PROPHYLAXIS

By means of a questionnaire, Erkkilä collected information from 210 workers employed in spray painting (175 men and 35 women) on the dangers to health in this type of work and the steps taken to prevent such dangers.[4] Almost all the workers reported some symptoms. Only 13 workers (6.2 per cent) reported no symptoms. While 157 (74.8 per cent) felt that the work was detrimental to health, 26 thought it quite safe. Twenty-seven workers were undecided on this point.

The following arrangements were used in different plants to prevent poisoning:

Ventilator and gas mask....63 cases (30.0%)
Ventilator .....39 cases (18.6%)
Gas mask .....61 cases (29.0%)

In 47 cases there were no safety arrangements of any kind. The author concludes that better arrangements should be made to safeguard the workers, and that they should be informed about the dangers associated with this work. Furthermore, he recommends that to rid the workshops of the heavy "paint dust" these be equipped with suction ventilators.

FLUOROGRAPHIC CONTROL OF TUBERCULOSIS AND SILICOSIS IN THE METAL INDUSTRY OF NORTHERN ITALY

Italian physicians since the time of Ramazzini have had a keen interest in problems of occupational medicine, and this interest is still active. Despite the difficulties of the post-war period, several journals devoted to this field have continued to appear. A number of items from recent issues of *Medicina del Lavoro* will illustrate this tendency.

Vigliani, Parmeggiani, and Zanetti report the results of a fluorographic survey from 1945 to 1948 among 25,253 workers in foundries and steel works of Northern Italy.[5] All these workers were insured against tuberculosis. Pneumoconiosis was observed in 2.20 per cent of the cases. These were divided into: reticulation and reticular fibrosis 1.45 per cent; nodular and massive silicosis and silico-tuberculosis 0.75 per cent. Dust alterations were found to be more frequent among workers in foundries and steel works (5 per cent), less frequent among those in cast iron and in nonferrous foundries, and fewer still among mechanical workers exposed to dust inhalation (0.92 per cent).

Tuberculosis (including primary complexes and healed foci) was revealed in 12.90 per cent of the workers. Cases of active tuberculosis, or such as were regarded as active were distributed as follows: steel foundries and plants 2.68 per cent; mechanical works 2.26 per cent; cast iron and nonferrous foundries 1.35 per cent. Tuberculosis was found to be more frequent in those industries where the silicosis danger is greater. The cases of active tuberculosis amounted to 1.90 per cent of the total.

The authors conclude that the fluorographic method is suitable for early

diagnosis and control of silicosis and tuberculosis in industry. Annual fluorographic examination reveals any progression of tuberculosis or silicotic lesions. A mobile fluorographic unit is more suitable for industrial establishments situated far from urban centers where fixed installations exist.

RADIOLOGICAL STUDIES OF THE LUNGS IN SILICOSIS

Zanetti made a radiological study of the hilar shadows of 1,026 silicotics.[6] A very high percentage of enlargements and thickening of the hili was observed, particularly in early forms. In more advanced nodular forms there is a tendency to a reduction of the previously enlarged hili. In massive or conglomerate silicosis the severe alterations of the parenchyma sometimes hide the hilar shadows to a considerable degree. In slowly advancing silicosis, the changes are often chiefly glandular, with considerable increase in the size of the shadows, especially noticeable in the case of the inferior parahilar glands.

EVOLUTION OF SILICOTIC LESIONS IN WORKERS NO LONGER EXPOSED TO DUST

What happens to the lesions of silicotics after removal from exposure to the deleterious dust? Montesano undertakes to throw light on this point.[7] He points out that there are three opinions on this matter: (1) That the lesions are arrested and in some degree undergo gradual resolution; (2) That the lesions continue to progress; (3) That they remain stationary.

Montesano has had experience with anthracite miners for several years, and has considered the problem from the medical, industrial, and medicolegal aspects. He began by studying and following 30 such cases, but as some dropped out later only 12 are reported in this paper. For 10 of the 12 workers, two x-ray photographs, taken 3 years apart are reproduced. The findings were quite similar in all the cases. The first x-ray examination showed a diffuse fibrosis, the second an "extensive massive silicosis."

Montesano was particularly impressed by the varying rates at which the lesions progressed. In some, the lesions after 6 months were at a stage which was not seen in others for years. The second point which he makes is that the lesions progressed whether or not the man was removed from his job. Third, the lesion progressed at the same rate no matter whether the workers stayed at their jobs or left. In the case of nine workers who had changed their occupation 3 to 5 years before, this did not change the development of the disease, provided that there was no associated tuberculosis. It should be mentioned that all these cases were not complicated by tuberculosis. The author recommends careful preëmployment examinations, frequent change of occupation, and adequate dust removal. He sums it up aphoristically: Don't remove the worker and leave the dust, but remove the dust and leave the worker.

THE PATHOLOGY OF WORKERS EMPLOYED IN THE PRODUCTION OF NITRO- AND DINITROBENZOL

Bellesini examined 22 workers engaged in the manufacture of nitrochlorobenzol and dinitrochlorobenzol.[8] Fifteen of these men who had been employed for less than a year complained of nothing but a slight dermatitis. The author points out that the workers are supposed to wear masks, gloves and special clothes, but as soon as supervision is relaxed masks and gloves are generally removed. The seven other men in the group had been employed for periods varying from 5 to 22 years. Chief complaints in this group were headache and cramp-like abdominal pains. Pruriginous dermatitis was common, but if the worker was removed from exposure for

a while this condition soon cleared up. The blood picture was characterized by a mild degree of hyperchromic anemia, with poikilocytosis, anisocytosis, and macrocytes. There was an increase in the reticulocytes. The white cell findings were quite variable. There was some hepatic enlargement. Bilirubin and to a lesser degree urobilin were increased in the blood, and the Takata-Ara reaction was positive.

The author points out that acute poisoning in the industry is rare, and that most of the workers have been employed for a long time. The compounds enter the body either through the skin or through the respiratory tract. Ordinary protective measures, if employed by the workers, seem to be adequate to prevent poisoning.

OCCUPATIONAL TUMORS OF THE LUNGS

Saita points out that pulmonary tumors have increased greatly during the past decades, and that many physicians feel that this development is due in part to increased industrial employment of irritant or toxic carcinogenic materials.[9] Consequently, he reviews clinical, statistical, and experimental data on tumors of the lungs caused by dust and substances used in industry. Saita concludes that only asbestos dust and coal tar derivatives have an unquestioned facility for producing tumors of the lungs. This is probably true also of certain radioactive substances and chrome derivatives. The percentage of workers affected with occupational pulmonary cancer is low. Consequently, strictly occupational cancers are responsible only in small part for the increase in pulmonary tumors in the last few decades.

BARRIER CREAMS IN THE PROPHYLAXIS OF OCCUPATIONAL DERMATOSES

Barrier creams as a method for the prevention of industrial dermatitis have not yet been introduced in Italy.[10] Puccinelli discusses the theoretical and practical principles involved, and how the creams may be used. He reports on the first encouraging results of experiments with such creams and expresses the hope that this protective device may soon be widely used in Italy.

OCCUPATIONAL PATHOLOGY OF GLASS THREADS

Cirla offers an interesting report on a group of 25 workers employed at covering electrical conductors with spun glass.[11] In this group symptoms were noted and these traced to the action of dust created from the glass fibers in various phases of the work. The symptoms affect chiefly the skin—persistent itching and needle-shaped areas of erythema, at times resembling scabies. Changes of lesser significance were noticed on the mucous membrane of the respiratory organs and the conjunctiva. The possibility of pulmonary damage from glass threads still lacks confirmation and further observation is needed. This also applies to the gastrointestinal tract. Protective measures recommended are the provision of showers for the workers, and measures for dust limitation and removal. Cirla concludes that the working of spun glass is exceedingly tiring, but not dangerous to any degree.

Maryland Observes an Anniversary

Maryland observed the 75th anniversary of the establishment of its State Board of Health on May 27, in connection with the 29th annual conference of the State Department of Health. In 1874 the General Assembly of Maryland became the sixth state legislature in this country to establish a board with statewide authority in matters pertaining to public health and prevention of disease.

Robert H. Riley, M.D., Director of the State Department of Health, points out that the forward looking step taken by Maryland three-quarters of a century ago was an expression of a national trend toward greater awareness of public health needs. At the time of its establishment the State Board of Health as summarized in the April issue of the *Maryland Health Bulletin* limited its interest largely to the prevention of epidemics, improvement of unfavorable sanitary conditions, and reporting of deaths. Personal hygiene entered the program in 1922 with the inauguration of preventive and educational services for expectant mothers, which were soon followed by school health work, a dental program and concern for industrial health problems. By 1934 each county in the state had full-time health service, reportedly the first state to achieve 100 per cent coverage. The organization of a medical care program for indigent and medically indigent residents of Maryland's counties in 1945 marked the extension of the health program into the curative field. Administration of chronic disease hospitals and state tuberculosis hospitals have followed. Mental health, cancer and heart programs have been the latest additions. In general the growth of Maryland's health program during the 75 years of existence reflects the advance of medical knowledge and the development of public health theory and practice in the United States and throughout the world.

Dr. Riley has been State Health Officer since 1928, in length of service the fourth oldest state health officer in the United States.

ASSOCIATION NEWS

SEVENTY-SEVENTH ANNUAL MEETING
AMERICAN PUBLIC HEALTH ASSOCIATION
NEW YORK, N. Y., OCTOBER 24–28, 1949

POST-CONVENTION TOUR TO BERMUDA
Six Days — 2½ Days in the Islands

A recent *News Letter* to the members proposed as a possibility a post-convention tour to Bermuda under Association auspices at the close of the 77th Annual Meeting in New York City. Many interested persons have responded and the tour will take place.

The party will leave New York at 3:00 P.M. on October 29—the meeting closes Friday afternoon, October 28—on the luxurious "Queen of Bermuda." The trip will be a real "House Party" with congenial companions.

The Hotel Princess will be home during the 2½ days in Bermuda. It stands on a peninsula overlooking Hamilton Harbor. Every one of its rooms commands a breath-taking view.

Bermuda is intriguing, picturesque, irresistible. It is a land of cedars and blossoms, sloping green hillsides, charming bays and beaches, of white and pastel coral cottages, and it has a tempo that banishes time and care. The hibiscus, bougainvillea, Bermuda morning glories, the oleander, zephyrantes, Guernsey lilies and many other varieties of flowers will be in bloom in late October. The sight-seeing program planned as part of the tour will give the party the best of the islands.

The schedule is as follows:

October 29	Leave New York at 3.00 P.M See the upper and lower Bays, the famous skyline, have tea and dance, if you will.
October 30.	In the Gulf Stream. A lazy day at sea, with deck sports and dancing for the not so lazy.
October 31.	Arrive Five Fathom Hole at 7:00 A.M. and cruise along the colorful North Shore into Great Sound and Hamilton Harbor. Ashore about 9:00 A.M.
	Half day sight-seeing trip to the South Shore, the Devil's Hole, Crystal Cave, Perfume Factory, and Aquarium, returning by the North Shore.
November 1.	This is the day for your shopping, your bicycling and your own individual investigations of Bermuda's sights and sounds.
	Sail at 3:00 P.M.
November 2.	On board the "Queen."
November 3.	Arrive New York about 9.00 A.M.

A scientific program afloat and ashore is being worked out. On ship there will be opportunity to visit the ship kitchens; the hospital; hear the officers discuss ship sanitation, disposal of wastes, control of vermin and the ship doctor discuss shipboard diseases, accidents and hazards. On shore a trip to the unique horizontal wells which provide most of the drinking water for Hamilton will be arranged for those interested. It is hoped that Dr. Henry Wilkinson, Senior Medical Officer of the Bermuda Medical and Health Department, or a member of his staff will acquaint the party with Bermuda's health program.

The inclusive price of all this begins at $183.80 and advances by easy stages for those who want the choicer staterooms and hotel rooms. Prices include room with private bath and meals on ship; hotel room with twin beds, bath and meals at the Hotel Princess; sight-seeing; baggage transfers between boat and hotel, federal and Bermuda taxes and all admissions on sight-seeing trip.

Mr. Leon V. Arnold, Travel Consultant, and as familiar with Bermuda as he is with the back of his hand, is acting for the Association in making travel arrangements. If you wish to be included in the group the Association will take to Bermuda this fall, write him at once at 36 Washington Square West, New York 11, N. Y., or address your letter to the Association Office, 1790 Brodaway, New York 19, N. Y.

THE 77TH ANNUAL MEETING

New York, N. Y., October 24–28, 1949

Hotel Reservation Form

Hotels	*Rooms with Bath*	
	Singles	*Doubles*
Belmont Plaza	$4.00–$7.00	$6.00–$9.00
Governor Clinton	3.50– 5.75	5.50– 9.50
Henry Hudson	3.50– 5.00	6.00– 8.00
Lincoln	4.00– 7.00	6.00– 9.00
Martinique *	3.00– 5.50	5.00– 8.00
McAlpin *	4.00– 7.00	6.50–10.00
New Yorker	4.00–10.00	7.00–13.50
Roosevelt	3.50–10.00	8.00–14.00
Statler	4.50– 7.50	7.00–10.00
Taft *	3.75– 7.00	6.50– 9.00
Tudor	3.00– 5.00	5.00– 9.00
Wentworth *	4.00– 6.00	6.00– 8.00

* The starred hotels which are listed above also provide rooms without baths at the following rates:

	Singles	*Doubles*
Martinique	$2.00–$3.50	$4.00–$5.00
McAlpin	3.00– 3.50	5.00– 5.50
Taft	3.00– 3.50	5.00
Wentworth	3.00– 4.50	5.00– 6.00

RESERVATIONS WILL BE HELD UNTIL 6:00 P.M. ONLY, UNLESS THE HOTEL IS NOTIFIED OF LATE ARRIVALS

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

Simon Abrahams, M.D., School of Public Health. Univ. of Minnesota, Minneapolis 14, Minn.. Student

John J. Curtin, 23 Pearl St., Medford 55, Mass., Agent, Medford Board of Health

Frank M. Doughty, P. O. Box 786, Plainfield, N. J., Health Officer

Clemente S. Gatmaitan, M.D., M.P.H., 1006 No. 4 Tennessee, Malate, Manila, Philippines, Chief, Division of Sanitation and Preventive Diseases, Bureau of Health

Arthur B. Greig. M.D., 360 N. Dale St., St. Paul, Minn., Student, School of Public Health, Univ. of Minnesota

Henry W. Kumm, M.D., Dr.P.H., Caixa Postal 49, Rio de Janeiro, Brazil, S. A., Representative in Brazil of The Rockefeller Foundation and Director, Yellow Fever Laboratory

Thomas E. Morgan, M.D., M.P.H., 1050 Hendricks Ave., Jacksonville, Fla., Health Officer, Duval County Health Dept.

Boringuen Mussenden, M.D., Medical Center of Puerto Rico, Santurce, Puerto Rico, Director of Clinic

Dr. Kenneth Sinclair-Loutit, School of Hygiene, Univ. of Toronto, Ontario, Canada, Postgraduate Student, Industrial Health, Univ. of Toronto

G. Murray Smith, M.D., C.M., D.P.H., Albert St., Windsor, Nova Scotia, Divisional Medical Health Officer, Dept. of Health, Province of Nova Scotia

Francisco B. Vasquez, M.D., M.P.H., Calceta, Manabi, Ecuador, S. A., Provincial Director of The National Malaria Service

Jane Wilkinson, M.D., Marion County Health Dept., Columbia, Miss., Health Officer

Laboratory Section

Maurice L. Augenblick, 5722 Florence Ave., Philadelphia 43. Pa., Chief Chemist, Sun Ray Drug Co.

Ross S. Benham, Univ. of Chicago, Dept. of Medicine, Chicago 37, Ill., Instructor of Medicine

Amedeo Bondi, Jr., Ph.D., Hahnemann Medical College, Bacteriology Dept., 235 N. 15th St., Philadelphia 2, Pa., Professor

Harriet M. Boyd, M.S., 698 Huntington Ave., Boston 15, Mass., Student, Harvard School of Public Health

Harold W. Bretz, 2031 Kessler Blvd., N. Drive, Indianapolis 22, Ind., Bacteriologist, State Board of Health

Marion M. Brooke, Sc.D., Communicable Disease Center, 291 Peachtree St., Atlanta, Ga., Senior Scientist-in-charge, Parasitology Branch

Scott V. Covert, M.A., Albany Medical College, Albany, N. Y., Instructor, Microbiology, Univ. of Pennsylvania

Reynold B. Czarnecki, Ph.D., Michigan State College, Bacteriology · Department, East Lansing, Mich., Instructor

Raymond DeVos, M.A., 140 Summit Ave., West Trenton, N. J., Personnel Technician, Civil Service Dept., State of New Jersey

Thomas L. Dwyer, M.D., 119 East Love, Mexico, Mo., Private Laboratory

Paul R. Elliker, Ph.D., Oregon State College, Bacteriology Dept., Corvallis, Ore., Professor of Dairy Bacteriology

John T. Fitzgerald, Mercy Hospital, Portland 3, Maine, Laboratory Director

Edward L. Foubert, Jr., Ph.D., Gonzaga Univ., Biology Dept., Spokane 11, Wash., Assoc. Professor

Harry Frankel, 201 Eastern Parkway, Apt. 6F, Brooklyn 16, N. Y., Laboratory Asst., Medical Bacteriology, Queens General Hospital

Victorien Fredette, D.Sc., 3170 Maplewood Ave., Montreal 26, Canada, Assoc. Professor of Bacteriology, Univ. of Montreal

Isabelle Havens, 5723 Dorchester Ave., Chicago 37, Ill., Asst., Dept. of Medicine, Univ. of Chicago

Werner Henle, M.D., 1740 Bainbridge St., Philadelphia 46, Pa., Professor of Virology, Univ. of Pennsylvania Dept. of Public Health and Preventive Medicine

Andrew M. Hyma, Ph.D., The DePree Co., Holland, Mich., Laboratory Director

William W. Leathen, M.S., Mellon Institute of Industrial Research, Pittsburgh 13, Pa., Fellow, Bacteriologist

Kenneth M. Madison, Ph.D., Mellon Institute of Industrial Research, Pittsburgh 13, Pa., Senior Fellow, Effect of Minc Acid on Self-Purification of Sewage

Irene G. Melvin, 605 Volunteer Bldg., Atlanta, Ga., Chief Technician, Tuberculosis Evaluation Laboratory, U.S.P.H.S.

Melvin L. Morse, M.S., Oak Ridge National Laboratory, Biology Division, Oak Ridge, Tenn., Junior Biologist

Paul S. Nicholas, Ph.D., 330 S. 13th East St., Salt Lake City 2, Utah, Asst. Professor of Bacteriology, Univ. of Utah

Adrienne Oshinsky, 3249 Glennon Place, New York 61, N. Y., Junior Bacteriologist, Queens General Hospital

Josephine Osterhoudt, M.S., Loyola Univ., Stritch School of Medicine, Chicago, Ill., Instructor in Bacteriology and Immunology

Edward H. Pahl, Box 169, Route 2, Autryville, N. C., Supervisor of Chemistry, Bacteriology and Urinalysis Depts., Station Hospital 2, Fort Bragg

Virginia Perkins, State Dept. of Public Health Laboratory, Atlanta, Ga., Bacteriologist

Morris L. Rakieten, M.D., Ph.D., 148 Islip Ave., Islip, Long Island, N. Y., Director, South Shore Analytical and Research Laboratory, Inc.

Charles C. Randall, M.D., Dept. of Pathology, Vanderbilt Univ., School of Medicine, Nashville, Tenn., Pathologist

Charles J. Rosebrook, 802 Doctors Bldg., Cincinnati 2, Ohio, Director, Rosebrook Clinical Laboratory

Theodor Rosebury, D.D.S., 630 W. 168th St., New York 32, N. Y., Assoc. Professor of Bacteriology, College of Physicians and Surgeons, Columbia Univ.

Lewis H. Schwarz, 1260 Madison St., Brooklyn 21, N. Y., Bacteriologist (Research), Dr. Joseph A. Lazarus, New York City

Beecher L. Scutchfield, M.S., Hazard Clinic, Inc., Hazard, Ky., Bacteriologist, Serologist, and Medical Technician

Joseph E. Simmons, M.S., Oregon State College, Corvallis, Ore., Chairman, Dept. of Bacteriology

Subbarao Ananta Swamy, M.B.B.S., D.P.H., "Satsuma," 169 Fisweswerapuram, Bangalore City, South India, Bacteriologist Public Health Institute, Dept. of Public Health, Government of Mysore

Charles M. Weiss, Johns Hopkins Univ., Dept. of Sanitary Engineering, Baltimore 18, Md., Chemist-Biologist, Baltimore Harbor Project

Armine T. Wilson, M.D., Alfred I. duPont Institute, Wilmington 99, Dela., Chief of Bacteriology and Pediatrician

Paul E. Zimpfer, Ph.D., 779 S. Cassingham Road, Columbus 9, Ohio, Professor of Biology, Capital Univ.

Statistics Section

Gilbert W. Beebe, Ph.D., 2101 Constitution Ave., Washington 25, D. C., Statistician, Committee on Veterans Medical Problems, National Research Council

Lealon M. Lacy, Georgia Dept. of Public Health, Atlanta, Ga., Director, Vital Statistics

Robert Bruce Watson, M.P.H., P. O. Box 277, Mississippi State College, State College, Miss., Asst. Professor of Government and History

Engineering Section

James H. Crawford, M.S., 605 Volunteer Bldg., Atlanta, Ga., Asst. Chief, Training Division, U.S.P.H.S.

Walter N. Dashiell, 114 Marietta St., U.S.P.H.S., Atlanta, Ga., Senior Sanitary Engineer

Pittman M. Jackson, Jr., State Health Dept., State Office Bldg., Engineering Division, Atlanta, Ga., Food Sanitation Specialist

Francis Mau, M.S., 1840 F-Kahakai Drive, Honolulu, T. H., Engineer, Suburban Water System

Charles A. McLoughlin, C.E., 162 Park St., Buffalo, N. Y., Assoc. Public Health Engineer; Chief, Bureau of General Sanitation, Erie County Dept. of Health

George G. Permut, 1400 Rosemary St., Denver, Colo., Sanitarian, Denver Health Dept.

Richard A. Petit, 125 W. 9th Ave., Huntington 1, W. Va., President, Huntington Building and Construction Trades Council

Arthur F. Robotham, 1926 Mesa Way, Santa Rosa, Calif., Sanitarian, Sonoma County Health Dept.

Robert L. Stenburg, 20 Oleander Ave., Savannah, Ga., Asst. Sanitary Engineer, U.S.P.H.S.

Perry R. Summerlin, P. O. Box 300, Statesboro, Ga., Regional Supervisor, Typhus Control Service, U.S.P.H.S.

Charles H. Turnbull, Box 750, Alaska Dept. of Health, Fairbanks, Alaska, Sanitarian

Industrial Hygiene Section

Arthur W. Meyn, M.D., 4057 Waveland Ave., Chicago 41, Ill., Industrial Hygiene Physician, State Board of Health

Robert B. O'Connor, M.D., 175 Berkeley St., Boston, Mass., Medical Director, Liberty Mutual Insurance Co., Loss Prevention Dept., N. E. Division

Joseph W. Spiselman, 1166 E. 7th St., Brooklyn 30, N. Y., Director of Research and Development, Air Purification Service Inc.

Food and Nutrition Section

Miriam G. Eads, M.S., U.S.P.H.S., Nutrition Branch, Division of Chronic Disease, Washington, D. C., Nutrition Field Consultant

Willard J. Godkin, M.S., 221 Harrington St., Bergenfield, N. J., Research Bacteriologist, National Bakery Division, The Great Atlantic and Pacific Tea Co.

Wilbur P. Pierce, Ph.D., Franconia, N. H., Sanitarian, American Institute of Baking

Jean F. Webb, M.D., C.M., D.P.H., 317 Longwood Ave., Boston 15, Mass., Research Fellow, Harvard School of Public Health

Maternal and Child Health Section

Carl G. Ashley, M.D., 2455 N.W. Marshall St., Portland 10, Ore., Private Practice, Pediatrics

Philip F. Lustbader, M.D., 577 Eastern Parkway, Brooklyn 16, N. Y., Medical Inspector, New York City Dept. of Health, Mothers and Young Childrens Section

Geoffrey M. Martin, M.D., State Board of Health, Topeka, Kans., Pediatric Consultant

Herbert C. Miller, M.D., Univ. of Kansas Medical Center, Kansas City 3, Kans., Professor of Pediatrics

Alberta W. Parker, M.D., 339 Western Drive, Point Richmond, Calif., Director, Maternal and Child Health, City of Berkeley Health Dept.

Public Health Education Section

Sister Angelica Howell, St. Agnes Hospital, Wilkens and Caron Ave., Baltimore 29, Md., Administrator

R. Keith Montgomery, 100 8th St., East, Owen Sound, Ont., Canada, Senior Sanitary Inspector, Dept. of Health

Robert A. Lambert, M.D., Brick Springs Road, Greensboro, Ala., Consultant, Pan American Sanitary Bureau

John E. Olsen, 1929 2nd St., N.E., Minneapolis 18, Minn., Student, Univ. of Minnesota

Public Health Nursing Section

Ruth D. Buckley, 659 Crescent Ave., Buffalo 16, N. Y., Supervisor in Public Health Nursing, Erie County Dept. of Health

Lucile V. Howes, M.N., 26 E. 7th, Arcata, Calif., Staff Nurse, Humboldt-Del Norte Bi-County Health Dept.

M. Maxine Hurley, R.N., Division of Health, Jefferson City, Mo., Cancer Nursing Consultant, Division of Health of Missouri

Hilda Jensen, R.N., Box 855, Pahokee, Fla., Public Health Nurse, Palm Beach County Health Dept.

Regina Kelly, 132 E. 45th St., New York 17, N. Y., Student, New York Univ.

Sister Pacifica McKenna, 371 W. 4th St., Laboure Center, South Boston, Mass., Public Health Nursing

Epidemiology Section

Henry B. Bruyn, Jr., M.D., Univ. of California Medical School, San Francisco 22, Calif., Instructor in Pediatrics, Univ. of California, Medical Center

Pao-Jai Hsu, M.D., 290 Lare 396 Chung-Ching Rd., (Southern) Shanghai 25, China, Division Chief, Dept. of Communicable Disease Control, Bureau of Health

Lauri Luoto, D.V.M., M.P.H., Q Fever Laboratory, Hondo, Calif., S.A. Veterinarian (R), U.S.P.H.S., National Institutes of Health

Carl O. Mohr, Ph.D., 605 Volunteer Bldg., Atlanta 3, Ga., Scientist (R), Officer in Charge, Typhus Control, Communicable Disease Center, U.S.P.H.S., Branch of Engineering Division

Ladislao Molnar, M.D., 3 Blvd., La Tour, Maubourg, Paris, France, Tuberculosis Consultant, American Joint Distribution Committee, European Headquarters

Kenneth C. Smithburn, M.D., International Health Division Laboratories, 66th and York, New York 21, N. Y., Staff Member, The Rockefeller Foundation

Frederick R. Weaver, M.E., 463 Chestnut St., Nutley 10, N. J., President, Air Purification Service Inc.

School Health Section

Seymour Glasser, M.D., 1600 Ocean Parkway, Brooklyn 30, N. Y., Physician, New York City Board of Health

David Malachowsky, M.A., 369 Riverdale Ave., Brooklyn 12, N. Y., Teacher of Health, New York City Board of Education

David Steinberg, M.D., 2415 Davidson Ave., New York 53, N. Y., Physician-in-charge (School Health), New York City Dept. of Health

Dental Health Section

George K. Clarke, D.D.S., D.D.P.H., Health Dept., 48 Rideau St., Ottawa, Ont., Canada, Dental Health Officer, Corporation of the City of Ottawa

Louis R. Middleton, D.D.S., 453 W. 155th St., New York 32, N. Y., Dental Supervisor, New York City Dept. of Health

Leila H. Silva, 316 Wyllie St., Honolulu 3, T. H., Dental Hygienist, Dept. of Public Instruction

Medical Care Section

C. Charles Burlingame, M.D., 200 Retreat Ave., Hartford, Conn., President and Psychiatrist-in-Chief, The Institute of Living

Enoch Callaway, M.D., 301 Church St., LaGrange, Ga., Director, Cancer Clinic, City-County Hospital

Donald W. Cordes, M.A., 1200 Pleasant St., Des Moines, Ia., Administrator, Iowa Methodist Hospital

Benjamin G. Dinin, M.D., 600 Albany Ave., Brooklyn 3, N. Y., Deputy Medical Supt., Kingston Avenue Hospital

Helen Freeman, R.N., AJDC-IRO, Area 2 Sub-

Area Ulm, APO 154, Postmaster, New York, N. Y, Area Nurse, American Joint Distribution Committee

Morris A Jacobs, M D 1170 Manor Road, Port Richmond, S I, N Y, General Medical Supt, Dept of Hospitals

Henry W. Kolbe, M D, Harlem Hospital 137th and Lenox Ave, New York N Y, Medical Supt, City of New York Dept of Hospitals

Alexander W. Kruger. M D, 125 Worth St, Room 521, New York, N Y, General Medical Supt, City of New York Dept of Hospitals

Lucile Petry, R N, M A, 2700 Wisconsin Ave, N W, Washington, D C, Chief Division of Nursing, U S P H S

Dorothy L Petsch, R N, Worthington Hospital Assn, Worthington, Minn, Student Univ of Minnesota School of Public Health

A P Ulbrich, D O, 13535 Woodward, Detroit 3, Mich, Dermatologist

George A Van Gemert, 2300 Connecticut Ave, N W, Apt 811, Washington 9 D C, Administrative Assistant, UMWA Welfare and Retirement Fund

Waldemar J A Wickman, M D, M P H, 5011 Jamestown Road, Washington 16, D C, Chief of Outpatient Section Division of Hospitals, Bureau of Medical Services, U S P H S.

Unaffiliated

Florence Brugger, M A, Public Health and Welfare, GHQ, SCAP, APO 500, Postmaster, San Francisco, Calif, Chief, Social Work Training Branch

John Flannery, 8320 13th Ave, Brooklyn 28, N Y, Student, Columbia Univ, New York, N Y

V. Keith Giddings, 1135 Fullerton, Chicago, Ill, Inspector, American Institute of Baking

August W Koenig, 400 Beverly, P O Box 179, Tracy, Calif, Administrator, Tracy Community Memorial Hospital

Dwight H Murray, M D, Box 209, Napa, Calif, Private Practice

Martin L Norton, 2317 Tiebout Ave, New York 57, N Y, Inspection Officer, Foreign Quarantine Division, U S P H S, Federal Security Agency

Chester F Porterfield, 56 E 52nd St, New York 22, N Y, Vice-president, L W. Frohlich and Co, Inc

Joseph J Rodelli, 1148–64th St, Brooklyn 19, N Y, Health Inspector, New York City Dept of Health

Herbert S Stalker, M D, Tranquille. B C, Canada, Medical Supt, Tranquille Sanatorium, British Columbia Tuberculosis Division

Morris A Wolf, R N, 675 E 140th St, New York 54, N Y, Registered Nurse

THE ENGINEERING SECTION PROJECT

The Engineering Section Project completed two and a half years of activity on May 1. On the same date it lost its first field director in that William T. Ingram, formerly Engineering Field Associate of the Association staff, became Associate Professor of Public Health Engineering at the New York University College of Engineering. Important and noteworthy progress has been made through the activities of Mr. Ingram, other members of the staff, and of the Engineering Section during the first 30 months of the Project.

The purpose of the Engineering Section Project is to improve administrative practices, assist in training personnel, and guide qualified individuals into public health activities in environmental sanitation. Some of the highlights of activities undertaken so far should be of interest to the whole public health profession.

The problems which attend the execution of environmental health services have been explored and analyzed. Administrative problems including the planning of programs, the evaluation of positions, and the determination of work loads have been discussed with state and local sanitation and health officials throughout the country. Problems of training engineers and sanitarians have been discussed with the workers and their supervisors and with those who do the training. Communities, colleges. and field training units have been visited, and personnel needs investigated. Many engineers and sanitarians now employed can trace their present employment to a Project activity.

A research project has been established to bring together and continue work now being done by several associations, schools, and health departments in the United States. Included in the research will be studies to determine the validity of objective methods of evaluating sanitation administrative practice. The program will also study and compare the effectiveness of program, job and time evaluation methods.

The Project has contributed, through publications, to the development of new concepts concerning the training of both engineers and sanitarians and has, through groups such as the Association Committee on Professional Education, and the Sanitary Engineering Subcommittee of the American Society for Engineering Education, played a part in the modification of training facilities to meet the field requirements for trained personnel. In coöperation with the Association Committee on Professional Education, data have been obtained and published indicating the extent of training facilities for engineers and sanitarians and the numbers enrolled for such training. Training through short courses for water works operators, sewage works operators, food handlers, milk plant operators, and others have been considered and information presented to interested groups. A roster of all sanitary and public health engineers in the United States is now in preparation.

The American Public Health Association is the professional home of all personnel engaged in public health work. The Engineering Section Project is the staff operation which brings together many activities common to the Engineering Section, the Committee on Professional Education, and the Committee on Administrative Practice. The interests of these three are voiced through the Engineering Section Project Coördinating Committee, comprised of Ira V. Hiscock, *Chairman*, Harold A. Whittaker, Sol Pincus, and Roy Morton. The project is supported this year by funds contributed by the National Sanitation Foundation, the American Can Company, and Wallace & Tiernan, Inc. Research work of the project is being carried on under a grant from the U. S. Public Health Service, Division of Research Grants and Fellowships.

RESOLUTIONS COMMITTEE FOR NEW YORK MEETING

Appointment of the Resolutions Committee to serve at the Annual Meeting in New York is announced by Charles F. Wilinsky, M.D., *President*. The members appointed are:

Herman E. Hilleboe, M D., *Chairman*
Mary P. Connolly
Robert D. Defries, M D.
Alfred L. Frechette, M.D.
Ruth W. Hubbard, R.N.
Stanley H. Osborn, M.D.
W. G. Smillie, M.D.

Suggested resolutions can be sent to the committee, c/o the Association, now. As in the past, a resolutions box will be placed near the registration desk, Hotel Statler, New York City, at the time of the Annual Meeting. The time for closing the box, as determined by the Executive Board, will be announced at that time.

A.P.H.A. membership application blank on page XXVII

EMPLOYMENT SERVICE

The following pages present information for those seeking qualified public health personnel and for those seeking positions in public health.

This is a service of the Association conducted without expense to the employer or employee.

Address all correspondence to the Employment Service, A.P.H.A., 1790 Broadway, New York 19, N. Y., unless otherwise specified.

POSITIONS AVAILABLE

Director for Public Health Nurses; requirements: Graduation from an approved university or college with a bachelor's degree in nursing, arts or science which included or was supplemented by courses prescribed for an approved program of instruction of public health nursing experience, at least two years of which were under adequate nursing supervision and two years of which involved responsibility for supervision of public health nursing; or any combination of public health nursing experience and special training which in the opinion of the Public Health Council is equivalent. Salary $3,500 plus $280 cost of living bonus; retirement system, vacation, sick leave, 45 hour week. Write Douglas H. Fryer, M.D., Commissioner of Health, Columbia County Dept. of Health, Hudson, N. Y.

Director of Nursing—salary $4,320–$5,400; **Supervising Public Health Nurse**—salary $3,660–$4,572. Must have California Nursing license and meet the standards as set up by the California State Department of Public Health. Five and a half day week, vacation, sick leave and retirement plan. Write William F. Stein, M.D., County Health Officer, County of Fresno, Fresno, Calif.

Physician as Director of City-County Health Department. Rapidly expanding, soon to be multi-county unit. Starting salary minimum $6,500 plus $75 a month expense. Will pay to $8,000 for right man. Write: Board of Health, Defiance, Ohio.

Field Supervisor—background of community organization and voluntary agency experience (preferably tuberculosis) would be essential. Prefer man, age 30 to 40, however the qualifications are of first importance. Salary range $3,336 to $4,200 plus travel and maintenance in the field.

Executive Assistant—background of administration and experience in writing would be essential. Salary range $4,200–$5,000. For both above openings write to: Virginia Tuberculosis Association, Atlantic Life Bldg., Richmond 19, Va.

Health Officer and Director of the Topeka-Shawnee County Health Department. Salary $7,600 to $9,120 plus travel allowance. M.D. degree, graduate work in public health and experience required. Duties varied. Write: Mayor, City Bldg., Topeka, Kan.

Director, Division of Epidemiology of the Kansas State Board of Health. Salary $6,600 to $7,800 plus travel allowance. M.D. degree, experience in epidemiology and general public health. Write: F. C. Beelman, M.D., Executive Officer and Secretary, Kansas State Board of Health, Topeka, Kan.

Director, Local Health Administration of the Kansas State Board of Health. Salary $7,600 to $9,120 plus travel allowance. M.D. degree, administrative public health experience. Write: F. C. Beelman, M.D., Executive Officer and Secretary, Kansas State Board of Health, Topeka, Kan.

Director for two-county health department located in Upper Peninsula of Michigan. Population approximately 27,000. Public health training and experience desirable. Salary $7,200 for qualified person. Must furnish car; 6¢ per mile. Write: Health Department, Stambaugh, Mich.

District Nutritionist in Mississippi State Board of Health Beginning salary for nutritionist is $2,800; nutritionist consultant $2,800 to $3,400; M. S. degree in public health nutrition. Write: Nutrition Services, Mississippi State Board of Health, Jackson, Miss.

Assistant Director, M.D. (Maternal and Child Health) beginning salary $6,192 with the Los Angeles County Health Department. Two years' recent experience in the practice of medicine in a public health department is required. Six months of the experience must have been in MCH. Write: Los Angeles County Civil Service Commission, 501 North Main Street, Los Angeles 12, Calif.

Public Health Nurses: for staff positions in county health department. Program includes a special project in Maternal and Child Health and a unique working relationship in health education with a teacher training institution. Excellent offices in a small college town in Central Michigan. Salary for nurses with public health training and experience $3,000 plus 6¢ per mile.

Write: Director, Isabella County Health Department, Mt. Pleasant, Mich.

Director for Visiting Nurse Association in suburb of Chicago; degree in public health nursing and at least five years' experience required; retirement plan, 40 hour week, small staff, N.O.P.H.N. standards and salary schedule maintained. Write: Miss Marion Carpenter, 1318 Judson Avenue, Evanston, Ill.

Health Education Consultant for city-county health department. Requirements: master's degree in health education and one year full-time experience in a local health department or voluntary health organization involving community organization. Start at $275 per month, with sick leave and annual leave. Industrial population of 180,000. Write: Director of Health, State Department of Health, Charleston 5, W. Va.

Director Tuberculosis Control: Public Health or sanatorium trained physician to direct tuberculosis program. Duties include reading of x-rays, consultations with patients and nurses, also some pneumothorax work and sanatorium rounds. Excellent opportunity for rounded program. Salary $7,500—maintenance for single physician. Apply to Dr. Paul M. Golley, Director, Chattanooga-Hamilton County Health Department, Chattanooga, Tenn.

Public Health Physicians: for District Offices of State Health Dept.; starting salary about $7,000 with increases to $7,650; excellent civil service and retirement system; write Roland R. Cross, M.D., Director, State Dept. of Public Health, Springfield, Ill.

Public Health Training Center: Experienced personnel—3 public health nurses; 2 sanitary engineers; 1 health educator, needed for Training Center just being started. Good salary. Write Roland R. Cross, M.D., Director, State Dept. of Public Health, Springfield, Ill.

Dentist to serve as clinician in a school dental health program, operating a well equipped modern dental trailer, salary $5,000 per annum. Write to: S. D. Sturkie, M.D., Director, Joint Health Dept., Charlottesville, Va.

Health Educator—Master's degree in public health with experience in teaching school and experience in local health department desirable. Salary $4,000 per year plus travel compensation. Large midwest university community. Write **Box A-69**, Employment Service, A.P.H.A.

Announcement

United States Public Health Service

A competitive examination for appointment of Medical Officers and for Veterinarians in the Regular Corps of the U. S. Public Health Service will be held on October 3, 4, and 5, 1949. Applications must be received no later than September 5. Forms and additional information may be obtained by writing to the Surgeon General, U. S. Public Health Service, Washington 25, D. C.

POSITIONS WANTED

Health Educator—M.A. in health education (Teachers College, Columbia), 32, male, married. Two years' working experience in health education with official and voluntary agencies including teaching; five years army officer in charge of group and public relations work in Special Service Division. Interested in position with official or voluntary agency or teaching. Write **Box HE-7**, Employment Service, A.P.H.A.

Laboratory Assistant—B.A.; several years' experience in routine and research in public health laboratories; office procedures and patient contact; desires position in industry or public health. Write **Box L-9**, Employment Service, A.P.H.A.

Sanitary Engineer—B.E., M.S., in Sanitary Engineering; 18 years' general engineering experience. Desires position in Sanitary or Public Health Engineering field preferably in the Southwest, with industry or health department. Write **Box E-11**, Employment Service, A.P.H.A.

Bacteriologist—B.S., four years' experience in the Hospital Corps of the U. S. Navy, laboratory testing, use of biologicals and administrative duties. Desires position in public health or industry. Write **Box L-10**, Employment Service, A.P.H.A.

Bacteriologist—academic position as instructor or assistant professor—B.S. Zoology, M.A. Plant Physiology, Fellow Bacteriology and Public Health. Experience: 4 years teacher public school systems; 4 years civil service; 5 years bacteriologist including chief medical technologist clinical laboratories, research work, viruses, streptococci and histological techniques. Write **Box LD-4**, Employment Service, A.P.H.A.

Opportunities Wanted

Health educator; B.S. (Education), M.P.H.; four years, staff public health nurse; four years, director, cancer health education unit; past several years, director, program, industrial and school health; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Health educator; M.S. Public Health, eastern university; four years, health educator, county health department; three years, health coördinator, liberal arts college; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public Health dentist; M.P.H.; three years, director, dental department, public schools; six years, dental officer, state department, public health; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public health physician; degrees, eastern schools; M.S. (Public Health) Columbia; has held important administrative appointments in Public Health here and abroad; experience in teaching; member, American Board of Preventive Medicine and Public Health; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public health nursing administrator; B.S. (Nursing Education), M.P.H.; three years' rural nursing; four years, supervisor, city-county health unit; past several years on faculty, university school of public health nursing; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Sanitary engineer; B.S., Civil Engineering; several years, sanitary engineer, tropics; past four years, chief, engineering division, county department of health; for further information please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Statistician; M.S., Ph.D. degree; five years' teaching experience; past several years, director vital statistics, division city health department; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

NEWS FROM THE FIELD

SECOND WHO ASSEMBLY MEETS IN ROME

United States delegates to the 2nd World Health Assembly which met in Rome during the month of June were as follows:

Delegates:
Leonard A. Scheele, M.D., Chairman
Surgeon General, U. S. Public Health Service
Mrs. Quincy Wright, Director, Council on Foreign Relations
Edward S. Rogers, M.D., Dean, School of Public Health, University of California

Alternates:
James R. Miller, M.D., Board of Trustees, American Medical Association
H. Van Zile Hyde, M.D., U. S. Public Health Service
Howard B. Calderwood, State Department, Division of United Nations Economic and Social Affairs

Consultants:
Allen J. Ellender, Democratic Senator from Louisiana
Joseph L. Pfeifer, Democratic Representative from New York

Delegates and observers from 70 countries and territories attended the Assembly.

At the time of going to press, few of the Assembly's decisions had been made. Among the action to be taken was the election of 6 new members of the Executive Board, the United States being one of the 6 countries the term of whose representative expires.

The proposed total budget of WHO for 1950 is approximately $17,000,000, made up of nearly $8,000.000 of regular contributions from member nations and about $9,000,000 for technical assistance under President Truman's plan for aid to "backward areas."

During the early days of the Conference the Program Committee concerned itself with plans for expanding maternal and child health activity, education and training of public health personnel, and venereal disease control. It agreed upon a $1,000,000 program for maternal and child health including expert advice and demonstration teams subject to further action by the Committee on Administration and Finance. It also agreed upon $800,000 for expanding the work of venereal disease control. As to the world-wide shortage of medical and other public health personnel, the establishment of international medical schools under WHO sponsorship in the organization's regional offices was proposed. A total budget of $3,000,000 for overcoming personnel shortages was recommended. The Program Committee also recommended a $1,000,000 attack on poor sanitation as the basic cause of filth-borne, insect-borne, water-transmitted diseases that weaken an estimated three-quarters of the world's population.

A meeting of the Executive Board was held immediately after the close of the Assembly's sessions.

LIAISON BETWEEN A.P.H.A. AND A.A.P. CHILD HEALTH COMMITTEES

Recognizing that they have the same ultimate objective, the A.P.H.A. Committee on Child Health and the American Academy of Pediatrics Committee for the Improvement of Child Health have prepared a joint statement which defines the separate contributions and avenues of approach, as well as the areas of mutual concern of these two groups. A digest follows:

The A.P.H.A. Committee on Child Health was established at the 1947 annual meeting to act for the Association in the expanding relationships with other national organizations concerned with children. It has been charged with development of a statement of principles, policies, and standards in the maternal and child health field; with making

recommendations concerning education for professional and technical workers in this field; and with the investigation of administrative, organizational, and program matters in child health. Professional public health workers in the field of maternal and child health are chiefly concerned with community-wide provision of services for mothers and children, financed and administered by public and private agencies. Since many of the workers in these programs are members of the American Public Health Association, the Association is in a position to influence the quality of community maternal and child health services.

The American Academy of Pediatrics Committee for the Improvement of Child Health was created in February, 1947, in anticipation of the need for prompt and appropriate action arising out of the Academy's nation-wide study of child health services. The purpose of the committee is to study for the Academy all matters pertaining to child health and welfare; to collect and analyze data; to furnish source material to Academy committees; and to submit recommendations for action by the Academy's Executive Board. The American Academy of Pediatrics is primarily concerned with establishing and maintaining the highest possible standards for pediatric education, practice, and research, and thus to preserve the quality of the preventive and curative aspects of medical care for children. Through its membership the Academy can influence the quality of care by working with medical societies to reach individual practitioners, and with medical schools and pediatric services of hospitals to reach medical students and nurses.

The programs and objectives of these two committees are closely related although the professional groups and approaches differ. The efforts of both are needed to bring about improvement in the care of children. The coöperation between these two committees will help to avoid duplication of effort and provide a basis for joint action in areas of mutual concern.

COMMISSION ON CHRONIC ILLNESS BORN

A permanent Commission on Chronic Illness was organized at a series of conferences in Chicago, May 19-20. The Commission represents the culmination of more than two years' work in laying the groundwork for a concentrated attack for the first time on the various aspects of the problem of what has been called the "daily disaster" of chronic illness. Late in 1946 a Joint Committee on Chronic Illness was formed by the American Hospital Association, American Medical Association, American Public Health Association, and American Public Welfare Association. This committee was staffed by the A.P.H.A. through its Subcommittee on Medical Care and its Chairman was Ellen C. Potter, M.D., representing the American Public Welfare Association. In October, 1947, the Joint Statement of Recommendations on Planning for the Chronically Ill by the four agencies, as prepared by their Joint Committee, was published (*A.J.P.H.* 37:10 (Oct.), 1947, p. 1256).

Upon these recommendations were built the discussion and conclusions of the Section on the Chronically Ill of the May, 1948, National Health Assembly. In the fall of 1948 the Joint Committee became the Interim Commission on Chronic Illness, continuing under Dr. Potter's chairmanship.

At the recent meeting in Chicago, when the permanent Commission was created, the membership was broadened to 30 persons, including wide interest and geographical representation. The A.P.H.A. is represented by Dean W. Roberts, M.D., chief, Bureau of Medical Services, Maryland State Health Department, and Edward S. Rogers, M.D., Dean, University of California School

of Public Health. The objectives of the Commission will be definitely formulated and published shortly, on the basis of discussions at a closed session of the recent Chicago Conference. It is expected that they will be broadly similar to the goals of the Interim Commission which were:

1. to modify the prevailing attitude of society that chronic illness is hopeless; to substitute for the prevailing over-concentration on the provision of institutional care, a dynamic program designed as far as possible to prevent chronic illness, to minimize its disabling effects, and to restore its victims to a socially useful and economically productive place in the community;
2. to define the problems arising from chronic illness among all age groups, with full realization of its social as well as medical aspects;
3. to coördinate separate programs for specific diseases with a general program designed to meet more effectively the needs common to all chronically ill persons;
4. to clarify relationships among professional groups and agencies working in the field of chronic illness; and
5. to stimulate adoption in every state and community of a well-rounded plan for prevention and control of chronic illness and for the care and rehabilitation of the chronically ill.

The Commission is organized as a nonprofit corporation under the laws of Illinois and is appealing to foundations and other agencies for funds with which to carry on its work. The American Medical Association has appropriated $20,000 and is furnishing office space and equipment for five years. The National Society for Crippled Children and Adults and the New York Foundation have each provided $2,500 and the former is furnishing some staff service.

The Commission has 32 technical advisors, experts selected on the basis of their experience and achievements in the field of chronic illness. At the Chicago Conference they explored five areas of activity pertinent to the Commission's work: clinical problems, institutional care, non-institutional care, rehabilitation and convalescence, and community problems.

Between sessions of the Commission its work will be guided by a five member Executive Committee made up of Thomas Parran, M.D., dean, University of Pittsburgh Graduate School of Public Health, Mrs. Joseph T. Ryerson, active participant in Chicago civic affairs and the three officers as follows:

Chairman: Leonard W. Mayo, S.Sc.D., Vice President, Western Reserve University
Vice chairman: James R. Miller, M.D., Member, Board of Trustees, American Medical Association
Secretary: J. Douglas Colman, Executive Director, Maryland Hospital Service

The U. S. Public Health Service has assigned Mrs. Lucille M. Smith of its staff to serve as Executive Secretary pending the appointment of a staff director. At the Chicago meeting the Surgeon General, Dr. Leonard A. Scheele expressed the federal government's keen interest in the new Commission. Without any official connection, he expressed the Service's attitude as "What Can We Do To Help?"

NEW ASSISTANT SURGEONS GENERAL

The Public Health Service has three new Assistant Surgeons General, including the first woman ever to hold that office. She is Lucile Petry, Chief Nurse Officer of the Service. She was inducted in ceremonies in the Federal Security Building, Washington, on June 7. The other two new Assistant Surgeons General are Otis L. Anderson, M.D., and Vane M. Hoge, M.D., both of the Bureau of Medical Services. Dr. Hoge has been chief of the Division of Hospital Facilities since it was created in 1946.

Surgeon General Leonard A. Scheele has also announced the creation of two new divisions in the Service, the Division of States Grants, successor to the Division of States Relations, whose chief is Estella Ford Warner, M.D., the first woman to be commissioned in the Regular Corps; and the Division of

Chronic Diseases whose chief is Albert M. Chapman, M.D., formerly assistant chief of the States Relations Division.

NEBRASKA'S DR. PETTY RESIGNS

W. S. Petty, M.D., Health Officer of Nebraska since 1946, resigned as of August 1. He had been in the State Health Department since 1942. No successor has been selected. Dr. Petty has announced that he will take a refresher course in cancer diagnosis before taking a new position. He said that salary was one of the primary reasons for his resignations, the legislature having killed a bill designed to lift the ceiling of $5,500 annually for the job. Because of the low salaries and other unfavorable circumstances, Dr. Petty said he had but one physician in the department with six vacancies; five physicians have left the state service in the last four years to accept positions with higher salaries.

ILLINOIS MEDICAL HEALTH OFFICERS

The full-time medical health officers of Illinois, at the recent meeting of the State Public Health Association, revived the Illinois Association of Medical Health Officers which had been discontinued some years ago after it merged with the Illinois Public Health Association. All full-time medical health officers, school health physicians, professors of public health and preventive medicine, and other medical men engaged in full-time public health work are eligible for membership in the health officers association.

The following officers were elected:

President: W. H. Tucker, M D.
Vice-President: S. N. Mallison, M.D.
Secretary-Treasurer: Norman J. Rose, M.D.
Executive Committee: Arlington Ailes, M.D., A. C. Baxter, M.D., P. A. Steele, M.D.

AMERICAN REGIONAL OFFICE, WHO

On March 1, under a working arrangement between the two agencies, the Pan American Sanitary Bureau began to serve as WHO's regional office for the western hemisphere. It thus becomes WHO's third regional office. As a corollary, the New York City Office of WHO was closed on April 29 and the WHO Liaison Office moved to Lake Success.

The Pan American Bureau, organized in 1902, is the central coördinating health body for the 21 countries in the Pan American Union. It is currently sponsoring large-scale programs of yellow fever control in several South American countries. It has a regional office for South America in Lima, Peru, for Central America in Guatemala City, and a field office in El Paso, Tex.

PAN AMERICAN SANITARY ORGANIZATION

Among the recommendations made by the Executive Committee of the Pan American Sanitary Organization, meeting in Washington in May, were the following:

1. Recommendation to the Directing Council of a 1950 budget for the Pan American Sanitary Bureau of $2,000,000.
2. The issue by American countries of a commemorative educational and publicity stamp in 1952, the 50th anniversary of the founding of the Pan American Sanitary Bureau as the first international health organization.
3. A program of surveying medical education centers through staff provided by the Pan American Sanitary Bureau.
4. Coöperation of the American countries in a program designed to eradicate smallpox from the Western Hemisphere.

LEGISLATION IN NORTH CAROLINA

Greensboro and High Point in Guilford County, North Carolina, have populations respectively of about 60,000 and 40,000. There are about 150,000 persons in the entire county, the most populous in the state. Currently there are three health jurisdictions but an act of the recent state legislature established a single county health department to replace the three. This is one of the

earliest, if not the first instance, of mandatory legislation for city-county health department consolidations.

The appropriation for public health work for the next biennium was doubled with a large share of the additional money to be used for local health work. The amount for local health work was more than tripled, from $350,000, to $1,150,000 a year.

An act was also passed making cancer a reportable disease.

AMERICAN HEART ASSOCIATION MEETS

At the June meeting of the American Heart Association in Atlantic City, H. M. Marvin, M.D., Associate Clinical Professor of Medicine, Yale University School of Medicine, was elected President of the Association. Other officers are:

President-elect: Howard B. Sprague, M.D., Harvard Medical School
Vice-president: Edgar B. Allen, M.D., Rochester, Minn.
Treasurer: Grant Keehn, New York (re-elected)

Among the actions taken by this annual meeting were preliminary steps for making the American Foundation for High Blood Pressure the American Heart Association's Council for High Blood Pressure Research. Also organized at this meeting was the Staff Conference of Heart Associations comprising professional staff workers in state and local affiliates of the national organization. At a dinner meeting of this Conference, Professor Ira V. Hiscock, Chairman of the Department of Public Health, Yale University School of Medicine and the retiring president of the Association, Tinsley R. Harrison, M.D., each spoke, the former on "Community Organization for Health."

HOME CARE FOR CHICAGO CANCER CASES

Michael Reese Hospital, has received a grant from the Illinois Division of the American Cancer Society, to supply free home care for indigent cancer patients on an experimental basis. The program supplements one already in operation for heart patients. The service is also being expanded to include patients with arthritis, diabetes, and neurologic disease.

OFFICERS, MONTANA ASSOCIATION

The Montana Public Health Association at its recent annual convention in Glendive elected the following officers:

President: B. C. Farrand, M.D., practising physician, Jordan
Vice-president: K. Elizabeth Anderson, Director of Health Education, State Health Department
Secretary: B. K. Kilbourne, M.D., State Health Officer

RED CROSS INITIATES INTERNATIONAL HEALTH BULLETIN

The League of Red Cross Societies, made up of the National Red Cross Societies of 66 countries, inaugurated a new quarterly bulletin in January, 1949. It has two purposes: "to give a summary of the most recent and most original projects undertaken by the National Societies and to report on any important developments in medical science which might interest the Red Cross."

Vol. 1, No. 1, January-March 1949, has four sections; one a general section of signed articles by Drs. Brock Chisholm and René Sand, among others; one on Red Cross Throughout the World with brief news notes on the international tuberculosis campaign, the Swiss Red Cross blood program and BCG Vaccination in Greece, and others; and one on Medical News, one item of which deals with the risks and drawbacks in the use of certain new drugs such as penicillin, streptomycin, vitamins, urethan, and hormones; and the fourth on International Medical Life.

The *International Health Bulletin of the League of Red Cross Societies,* issued in both French and English, is edited by Drs. G. Alsted and Z. S. Hantchef at 8, rue Munier-Romilly,

Geneva. Its annual subscription is 6 Swiss francs or $1.50. Subscriptions should be arranged through the National Red Cross.

PLUMBING CODE ACCEPTED BY NEW YORK

The New York State Department of Health has accepted the recently published *American Standard Plumbing Code* and is recommending its adoption by municipalities in New York State. The *Code* was prepared by a committee sponsored jointly by the American Society of Mechanical Engineers and the A.P.H.A. Copies may be obtained from the A.S.M.E., 33 West 39 Street, New York. $2.50.

ARIZONA PUBLIC HEALTH ASSOCIATION

The 19th annual meeting of the Arizona Public Health Association in Prescott, May 12-13, replaced the lecture method previously used with a series of workshop sessions in which everyone had an opportunity to participate actively and to discuss problems dealing with his phase of public health work. A general forum followed section meetings of nurses, sanitarians, clerks and laboratory personnel.

Robert E. Rothermel, M.D., assistant field director, American Public Health Association, who was also moderator of the panel, "To Arizona's Future Health," spoke on health in Arizona, comparing expenditures of the "Baby State," which amount to approximately 24 cents per person, with the Hawaiian Islands where over $4 per person is spent annually.

The 1950 meeting is to be held in Safford and will again use the workshop technique.

Officers for the coming year are:

President: Mrs. Marion Sprague
President-elect: C. E. Reddick, M.D.
Vice-president: Margaret Eacrett
Secretary: Doris L. Rakop
Treasurer: Mary E. Peterson

Dr. Reddick and Mrs. Sprague are in the State Health Department, respectively as director of local health administration and administrative assistant.

COLORADO PUBLIC HEALTH ASSOCIATION

The annual meeting of the Colorado Public Health Association was held in Pueblo May 23-24 under the Presidency of Mrs. Mary H. Emberton, R.N., of Denver. The Secretary was Sara Lon Harrison and Chairman of the Program Committee was Norma Johannis, both of Denver. About 200 persons attended.

Out-of-state speakers included Fred T. Foard, M.D., Director of Health, U. S. Indian Service, Washington; Cyrus Maxwell, M.D., U. S. Office of Education, Washington; Fred Hein, M.D., American Medical Association, Chicago; Martin W. Fleck, Professor of Physiology, University of New Mexico, and Reginald M. Atwater, M.D., American Public Health Association, New York.

Symposia were held on state and local health councils, school health, veterinary medicine in public health, on industrial hygiene, mental health, and the interrelationships of preventive and curative services.

Officers elected at Pueblo include:

President: Roland H. Loder, M.D., Greeley
Vice President: Francis L. Candlin, D.V.M., Denver
Secretary: Mrs. Nevin Kilpatrick, Denver
Treasurer: Norma Johannis, Denver

GEORGIA PUBLIC HEALTH ASSOCIATION

The 20th annual meeting of the Georgia Public Health Association was held in Savannah, May 2–4, under the Presidency of Dr. C. A. Henderson, Health Officer of Savannah. Annie Taylor of the State Department of Health was Secretary.

Almost 500 persons registered for the three day meeting during which a series of general and special sessions were planned, representing a wide variety of public health interests. Special symposia

were held on stream pollution control, on medical nutrition surveys, on community organization, and on housing.

Out-of-state participants on the program were Russell M. Wilder, M.D., of the Mayo Clinic, Rochester, Minn.; Charles L. Williams, Sr., M.D., U. S. Public Health Service, Washington, D. C.; Professor and Mrs. C.-E. A. Winslow, New Haven, Conn.; Ruth E. Grout, Ph.D., University of Minnesota, Minn.; Warren T. Davis, Jr., U. S. Public Health Service, New Orleans, La.; M. R. Kinde, M.D., W. K. Kellogg Foundation, Battle Creek, Mich.; Emilie G. Sargent, R.N., Detroit Visiting Nurse Association, Detroit, Mich.; William P. Richardson, M.D., University of North Carolina, Chapel Hill, N. C.; and Reginald M. Atwater, M.D., A.P.H.A., New York.

New officers were elected as follows:

President: James A. Thrash, M.D
President-Elect: Charles D. Bowdoin, M.D.
Vice-President: Bessie F. Swan, R.N.
Secretary: C. S. Buchanan
Treasurer: Ernest B. Davis

NEW YORK STATE HOLDS 45TH ANNUAL HEALTH CONFERENCE

The 45th Annual Health Conference under the auspices of the New York State Department of Health was held at Lake Placid, N. Y., June 20–23. There was a large attendance representing health officers, public health nurses, sanitation personnel, school physicians, and others. Herman E. Hilleboe, M.D., M.P.H., Commissioner of Health, was Chairman.

Among the special sessions of the program were recent advances in the control of communicable diseases, how to get community participation for better health services, working for the establishment of basic local health services, water pollution control, nutrition in relation to dental health, international classification of diseases, injuries and causes of death, human relations in public health, local health records and their uses in administration and research, and other topics.

Out-of-State speakers included W. Palmer Dearing, M.D., Deputy Surgeon General, U. S. Public Health Service, Washington; Leroy E. Burney, M.D., Commissioner of the Indiana State Health Department, Indianapolis; A. L. Hoyne, M.D., Medical Superintendent of the Contagious Disease Hospital in Chicago; Emanuel B. Schoenbach, M.D., Department of Preventive Medicine, Johns Hopkins University, Baltimore; Joseph A. Bell, M.D., National Institutes of Health, Bethesda; Margaret Arnstein, R.N., M.P.H., Associate Director, Division of Nursing, U. S. Public Health Service, Washington; John W. Knutson, D.D.S., Chief, Dental Public Health Section, U. S. Public Health Service, Washington; Neal Chilton, D.D.S., Acting Chief, Section on Dental Diseases, New Jersey State Department of Health, Trenton; Adelia M. Beeuwkes, Assistant Professor, School of Public Health, University of Michigan, Ann Arbor; W. Thurber Fales, D.Sc., City Health Department, Baltimore, Md.; Thomas Parran, M.D., Dean, Graduate School of Public Health, Pittsburgh, Pa.; and Evelyn Flook, Chief of Records and Reports Section, Bureau of State Services, U. S. Public Health Service, Washington.

DDT INCORPORATED IN PAINT

Successful incorporation of DDT in oil-base paints, both flat and gloss, was reported by W. K. Lewis, Jr., and associates, before a meeting of the South Carolina Academy of Science in April, 1949. Tests of the toxicity of the paints carried on over a period of 3 years at the Crop Protection Institute, Durham, N. H., showed a high degree of effectiveness in paints applied at the beginning of the test period, according to the report. According to the authors, use of paint containing DDT should result

in cheaper control of insects plus less danger of possible harmful effects of DDT to man.

WESTERN BRANCH AMERICAN PUBLIC HEALTH ASSOCIATION

The 1949 meeting of the Western Branch American Public Health Association was held in Los Angeles May 30–June 1, under the presidency of George M. Uhl, M.D., M.P.H., the Health Officer of Los Angeles.

Nearly 1,200 persons registered during the three days and participated actively in programs built around dental health, poliomyelitis, Q fever, viral diseases, public medical care, atmospheric pollution, mental illness, the public health laboratory, public health nursing, pending federal legislation, geriatrics, tuberculosis control, training of public health personnel and sanitation. A large exhibit was a feature of the meeting and included the "Take an Examination" booth of the A.P.H.A. Merit System Service.

Among the participants from outside the area of the Western Branch were Ellis Tisdale, Engineer Director, U. S. Public Health Service, Atlanta, Ga.; Ernest B. Howard, M.D., American Medical Association, Chicago; R. A. Jensen, M.D., Minneapolis, Minn.; K. F. Maxcy, M.D., Johns Hopkins University, Baltimore; Edward G. McGavran, M.D., School of Public Health, Chapel Hill, N. C.; Seward E. Miller, M.D., U. S. Public Health Service, Atlanta, Ga.; Russell I. Pierce, M.D., U. S. Public Health Service, Washington, D. C.; B. Lees Read, Guy's Hospital, London, England; and Reginald M. Atwater, M.D., American Public Health Association, New York.

The Program Committee was under the chairmanship of Charles M. Carpenter, M.D., Los Angeles. Walter S. Mangold was Secretary and Treasurer.

The new officers of the Western Branch include the following:

President—Arthur L. Ringle, M.D., Asst. Chief, Tuberculosis Section, Area Office, Veterans Administration, San Francisco, Calif.

President-Elect—Wilton L. Halverson, M.D., State Director of Public Health, San Francisco, Calif.

1st Vice-President—L. S. Goerke, M.D., Director, Bureau of Medical Services, Los Angeles City Health Department, Los Angeles, Calif.

2nd Vice-President—Portia Irick, R.N., Director, Public Health Nursing, State Health Department, Santa Fe, N. M.

3rd Vice-President—Robert A. Downs, D.D.S., Director of Dental Health, State Department of Health, Denver, Colo.

Secretary-Treasurer—Walter S. Mangold, Associate Professor of Public Health, University of California, Berkeley, Calif.

UNIVERSITY OF PITTSBURGH FACULTY APPOINTMENTS

Thomas Parran, M.D., Dean of the University of Pittsburgh Graduate School of Public Health, has announced the following faculty appointments:

Antonio Ciocco, D.Sc., Deputy Chief, Division of Public Health Methods, U. S. Public Health Service—Head, Department of Biostatistics.

James A. Crabtree, M.D., Dr.P.H., Director, Medical Division, National Security Resources Board—Head, Department of Public Health Practice.

Paul M. Densen, D.Sc., Chief, Medical Research Statistics Division, Department of Medicine and Surgery, Veterans Administration—Associate Professor of Biostatistics.

Theodore F. Hatch, Resident Director, Industrial Hygiene Foundation, Pittsburgh—Professor of Industrial Health Engineering.

TWO NEW LASKER AWARDS

The Albert and Mary Lasker Foundation recently announced two new awards in its purpose "to acknowledge and publicly recognize efforts made by individuals or groups to combat the major causes of disease and death." The new awards for distinguished journalism will be given to writers of articles or a series of articles published in (1) an American daily or weekly newspaper, and (2) an American magazine, pertaining to the improvement of health or the prolongation of life through

medical research or other relevant means.

The awards of $500 each and a statuette replica of the Winged Victory of Samothrace, are being administered by the Nieman Foundation for Journalism, 44 Holyoke House, Cambridge 38, Mass., to whom all inquiries and requests for entry blanks should be made. Entries must be mailed not later than February 1, 1950, and must carry a 1949 publication date. Articles published in commercial house organs, technical medical and other limited professional journals are ineligible.

TREND OR ISOLATED INSTANCE?

In its May issue, the last before giving up publication because of "budget tightening," the *Health Commentator* of the Washington State Department of Health, reports a 16 per cent reduction in operating funds available to the department. Among the activities curtailed as a result is the closing on June 10 of the rapid-treatment center for syphilis, thus returning the treatment of low-income syphilis patients to local health departments. The state's mobile x-ray unit will be discontinued by the end of 1949; funds for the handicapped children's program have been cut by 17 per cent; more than two dozen state department workers have been dismissed; new sponsorship is being sought for a member of activities—the Seattle Guidance Clinic, the health film library, the tumor registry, among them.

PERSONALS

LEWIS W. ANDREWS, M.P.H., for the past 3 years, Director of Community Health Education, Kansas State Board of Health, has resigned to become director of public health education, Wichita-Sedgwick County Public Health Department.

REGINALD M. ATWATER, M.D., DR. P.H.,* of New York received the honorary degree of Doctor of Laws at the June Commencement of Colorado College, Colorado Springs, where he gave the commencement address.

ROBERT L. BOGLE is now sanitarian of Woodruff, Cross, and Prairie Counties, Arkansas, with headquarters at Augusta.

BERNARD M. BLUM, M.D., M.P.H.,* who has been District Health Officer of the Washington Heights-Riverside Districts, New York City Department of Health, and Assistant Professor in the Columbia University School of Public Health since 1941 has resigned to become Medical Director of the Fife-Hamill Memorial Health Center, Philadelphia, and Professor of Preventive Medicine and Public Health, Jefferson Medical College.

MARTHA BRANSCOMBE, PH.D., who has been Assistant Chief of the U. S. Children's Bureau, Washington, has resigned to join the staff of the Elizabeth McCormick Memorial Fund, Chicago, succeeding MARY MURPHY, deceased.

GLIDDEN L. BROOKS, M.D.,† has been appointed an Associate Director of the American Academy of Pediatrics' Committee for the Improvement of Child Health, Philadelphia. He will aid in developing an action program for the nation-wide improvement of child health.

DAVID D. CARR, M.D., M.P.H.,* has resigned his position as Director of the Topeka City-Shawnee County Health Department to accept a position as County Health Officer of Las Vegas, Nev.

HOLLAND M. CARTER, M.D.,† Director of the Madison and Taylor Counties Health unit in Florida has accepted a position with the South Carolina State Board of Health.

ALTA ELIZABETH DINES,* recently retired as Director of the Department

---

* Fellow A.P.H.A.
† Member A.P.H.A.

of Educational Nursing of the Community Service Society, New York, and MARY M. ROBERTS, recently retired as editor of the *American Journal of Nursing*, on June 28 were awarded the Florence Nightingale Medal this year for "distinguished service and great devotion to the sick and wounded in time of war and in time of peace," at the American Red Cross national convention in Atlantic City.

CLIFTON O. DUMMETT, D.D.S.,† Professor of Dentistry and Dean of the School of Dentistry, Meharry Medical College, Nashville, has been appointed Chief of the Dental Service at the Tuskegee, Ala., Veterans Administration Hospital effective August 1.

ALEXANDER M. EARLE, M.D., formerly with the Pediatric Service of Bellevue Hospital, New York, is now pediatrician of the Virgin Islands Department of Health.

C. A. ELVEHJEM, PH.D., of the University of Wisconsin, at the recent annual meeting of the National Live Stock and Meat Board, was presented an award in recognition of his contribution to the science of biochemistry and his leadership in the field of nutrition.

JOHN E. FARRELL, SC.D.,* Executive Secretary of the Providence Medical Association, the Rhode Island Medical Society, and the Council of the New England State Medical Societies, was reëlected the secretary-treasurer of the Conference of Presidents and Other Officers of State Medical Associations at the 5th annual meeting of that organization at Atlantic City, on June 5.

FLOYD M. FELDMANN, M.D., DR.P.H.,* present Medical Director, Central Coordination and Analysis Office and Executive Secretary, Tuberculosis Study Section, U. S. Public Health Service, has joined the staff of the National Tuberculosis Association as Assistant to the Managing Director, JAMES E. PERKINS, M.D.*

WILLIAM H. GAUB, PH.D.,* has resigned as head of the Laboratory Section, Washington State Health Department, to be in charge of the U. S. Public Health Service Bacteriological and Parasitological Laboratories at Anchorage, Alaska. His duties will be assumed by W. R. BIEDT, M.D.,* Epidemiologist of the department.

JAMES B. HALL, M.D., who has just obtained his degree of Master of Public Health at the University of California, has succeeded H. A. SAUBERLI, M.D.,† as Director of the Leon County Health Department, Florida.

JOHN W. HART,† Director of the new products division, Sterling-Winthrop Research Institute, has been named a commander of the Order of Carlos Finlay by decree of President Prio of Cuba and action by the Cuban Congress. He will be presented the grand cross of the Order by the Cuban President in a presentation ceremony in Havana on December 3.

JOHN M. HENDERSON,* Professor of Sanitary Science, Columbia University School of Public Health, is on a 3 month assignment as consultant in malaria control with the World Health Organization, assigned to the training center in malaria control for southeast Asia, at New Delhi, India.

RAFAEL HERNANDEZ, PH.D., a former Meharry Medical School professor, has been added to the Virgin Islands Health Department staff, as a psychiatrist.

JOHN T. HERRON* has returned from the Harvard School of Public Health, with the Degree of Master of Public Health, to his duties as Assistant State Health Officer and Director of the Bureau of Local Health Services, Arkansas State Board of Health.

LOUISE JAMES,† who has been taking

* Fellow A.P.H.A.
† Member A.P.H.A.

advance work in pediatric nursing, in June resumed her duties as Maternal and Child Health Consultant in the Public Health Nursing Service, Arkansas State Health Department.

RALPH J. JOHNSON,† Sanitary Engineer, U. S. Public Health Service, and Consultant of the Service in the Hygiene of Housing has been appointed a member of the Joint Committee on Housing and Health of the National Organization of Housing Officials and the American Public Health Association of which BLEECKER MARQUETTE * of Cincinnati, Ohio, is Chairman.

EMANUEL KAPLAN, Sc.D.,* Chief, Division of Chemistry Bureau of Laboratories, Baltimore City Health Department, was recently elected President of the Central Atlantic States Association of Food and Drug Officials for the year 1949–1950.

GLEN KELLOGG, who has completed his work for a Degree of Master of Public Health in Sanitation at the University of North Carolina School of Public Health, has returned to the Arkansas Health Department as Sanitary Engineer in the Bureau of Sanitary Engineering.

LAWRENCE KOLB, M.D., has resigned as Director of Research Projects for the National Institute of Mental Health to become Consultant in Psychiatry at the Mayo Clinic, Rochester, Minn. JOHN EBERHART, M.D., Chief Psychologist of the Training and Standards Branch, succeeds Dr. Kolb.

H. M. C. LUYKX, D.Sc.,* Associate Professor of Preventive Medicine, New York University College of Medicine, has a 2 year appointment as Biometrician for the Atomic Bomb Casualty Commission in Japan, stationed in Kure. The Commission sponsored by the Atomic Energy Commission operates under the Committee on Atomic Casualties of the National Research Council.

ETHEL AUSTIN MARTIN,* Director of Nutrition Service, National Dairy Council, Chicago, is among the United States delegation to the 12th International Dairy Congress, being held at Stockholm, Sweden, August 15–19.

MARY ELIZABETH MCCONNELL, formerly connected with the Rochester, Minn., Health Department, working with Drs. Aldrich and Spock in the child health project, on May 15 became supervising nurse of the Division of Public Health Nursing, Ulster County (New York) Health Department.

MABEL OLSON, for the past 4 years public health nursing consultant in maternal and child health, Arizona State Department of Health, has resigned to return to her home in Cedar, Minn.

CLARENCE OVERCASH,† who received a Master of Public Health in Industrial Engineering at Michigan University has returned to his position as industrial engineer in the Industrial Hygiene Division, Arkansas State Health Department.

JAMES ELMER PETERMAN, M.D.,† has been appointed Assistant Health Officer in the Baltimore (Maryland) County Health Department succeeding ELIZABETH L. LANGELUTTIG, M.D., resigned. Dr. Peterman served for 5 years in the U. S. Army, 2 of them in the Division of Medical Statistics, Office of the Surgeon General, and nearly 2 in the Preventive Medicine Division, Office of the Chief Surgeon, Southwest Pacific Theatre.

ELIZABETH REED, R.N.,† who served as Acting Director of the Division for several months prior to completing work for the bachelor of science degree at Columbia University, has been appointed Director, Division of Health Information, Florida State Board of Health.

H. A. SAUBERLI, M.D., M.P.H.,† who has been Health Officer of Leon County, Tallahassee, Fla., since 1947,

has resigned to become Director of Local Health Services in the Colorado State Department of Public Health, Denver.

WILLIAM H. SHEETS, is the new field agent in the Bureau of Vital Statistics, Arkansas State Health Department.

JAMES C. THOMSON, PH.D.,† Professor of Nutrition, Nanking University, China, who for the past 2 years has been Visiting Professor of Nutrition in the West China Union University, Chengtu, is now lecturing at the Dr. Sun Yat-Sen Memorial Medical College, Lingnan University, Canton, in nutrition and during the summer will give a similar course at the Cheeloo Medical College, now temporarily located in Foochow.

WINSTON H. TUCKER, M.D.,* Health Commissioner, Evanston, received double honors at the recent annual meeting of the Illinois Public Health Association. He was elected President of the Illinois Association of Medical Health Officers, and made President-elect of the Illinois Public Health Association.

E. GIFFORD UPJOHN, M.D.,† Vice President, the Upjohn Company, Kalamazoo, Mich., was elected President of the National Vitamin Foundation for 1949 at the annual meeting of foundation members in New York, succeeding BASIL O'CONNOR,† President of the American Red Cross, who was named to the newly created position of honorary chairman of the Board of Governors.

HARRY F. WILSON, M.D.,* Director of the Division of Industrial Health, South Carolina State Board of Health, has been made Director of the Division of Laboratories as well.

THE FOLLOWING ARE NEW COUNTY HEALTH OFFICERS IN FLORIDA:

JOSEPH M. BISTOWICH, M.D.,† Leon County.

ROBERT RUSSELL, M.D.,† Jefferson County

JAMES L. WARDLAW, M.D., Madison-Taylor Counties.

MARYLAND PUBLIC HEALTH:

W. ROSS CAMERON, M.D.,* has been appointed Director of the new heart program which will be financed by a grant from the Public Health Service under the National Heart Act.

CARROLL E. L. EASTERDAY, M.D., was appointed Deputy State and County Health Officer of Frederick County, effective May 1, 1949.

LUCILLE A. WALLIS,† formerly public health nursing consultant in venereal diseases, became Assistant Chief of the Division of Public Health Nursing on April 1.

DEATHS

WILLIAM B. BORDEN, M.D., DR.P.H. (Col. (MC) Retd.),† Assistant Superintendent, Pinehurst State School, Wayne, Pa., died May 15, 1949 (Vital Statistics Section).

WILLIAM J. BUTLER, D.V.S.,† State Veterinary Surgeon and Executive Officer, Montana Livestock Sanitary Board, Helena (Unaffiliated).

W. E. DOYLE, M.D.,* Medical Director in the U. S. Public Health Service, died suddenly April 11. He had been stationed at the medical center of the National Cancer Institute since December 1, 1948 (Industrial Hygiene Section).

EDWIN BRUCE GODFREY, M.D.,† Director, Webster Parish Health Unit, Minden, La. (Health Officers Section).

WILLIAM F. HIGBY,* Executive Secretary, California Tuberculosis and Health Association, San Francisco, died June 24 (Public Health Education Section).

* Fellow A.P.H.A.
† Member A.P.H.A.

DWIGHT FENN JOHNSON, M.D., health officer of the town of Arcadia, Wayne County, N. Y., since 1912, died recently at the age of 70.

ERNEST C. MCCULLOCH, D.V.M., PH.D.,† Professor of Bacteriology, State College of Washington, Pullman, Wash. (Laboratory Section).

SIR GEORGE NEWMAN,* Ministry of Health, Whitehall, S.W.I., London, England (Unaffiliated).

RAY LYMAN WILBUR, M.D., formerly Fellow of the Association died June 26 at the age of 74.

35 YEAR INDEX

OF

American Journal of Public Health

Volumes 1 to 35 for the Years 1911 to 1945

All of the literature published on a given subject in the Journal during the years 1911 through 1945 will be found in one place. A complete Author's index is also included. The *Index* makes available a vast storehouse of valuable information contained in the fifty thousand pages published during this period. The tremendous task of preparing the *Index* was done by Louise Pickens Tanner, Ph.D., and Fred W. Tanner, Ph.D.

340 Pages — 6¾ x 9¾ — Bound in Buckram

Price $7.00

DOES YOUR CITY KNOW ITS HOUSING PROBLEM?

Just where and how big are the slums? How substandard are they, and in what ways?

Can part of the problem be solved by enforcement of reasonable housing codes?

What families need new housing, and how much can they pay for it?

These and other basic questions of housing policy can be answered with data from

AN APPRAISAL METHOD FOR MEASURING THE QUALITY OF HOUSING:

A Yardstick for Health Officers, Housing Officials and Planners

This is the survey technique, developed by the American Public Health Association's Committee on the Hygiene of Housing, of which Abel Wolman has said:*

> "It is one of the major contributions to translating opinion into objective measurement in one of the most difficult fields of appraisal."

Officially adopted by health departments in cities ranging from Battle Creek and Brookline to Milwaukee, St. Louis and Los Angeles, this method is now being promoted by the U. S. Public Health Service.

The Method is Completely Described in the Following Publications:

Part I. NATURE AND USES OF THE METHOD $1.00
This introductory volume is written for the policy-making official. In 53 readable pages, with many illustrations, it tells how practical housing programs can be shaped from an objective survey.

Part II. APPRAISAL OF DWELLING CONDITIONS $5.00
Three separate manuals give step-by-step instructions to the local survey director, the field crew and the office staff of a dwelling survey.

Part III. APPRAISAL OF NEIGHBORHOOD ENVIRONMENT In Press
Similar instructions are given for measuring the physical adequacy of neighborhoods.

Announcing the publication of

DIAGNOSTIC PROCEDURES IN VIRUS AND RICKETTSIAL DISEASES

This handbook, prepared by the Committee on Virus and Rickettsial Diseases of the Laboratory Section and edited by the Chairman of the Committee, Thomas F. Francis, Jr., M.D., details procedures which can be employed and interpreted by laboratory workers in the diagnosis of sixteen virus diseases. The diseases selected are essentially those of man for which procedures are available for use in a diagnostic laboratory.

Each of the sixteen sections has been written by an authority in the field. Much of the experience of each author has been contributed to his chapter and as a result the entire volume constitutes a compilation of methods proved by actual experience.

The volume has grown out of a recognized need for a publication of collected methods and has developed from a round table presentation at the Annual Meeting of the American Public Health Association in 1946. The methods are not presented as standards but are those most currently useful.

Members of the committee who have contributed and their subjects are as follows:

Psittacosis
K. F. Meyer, Ph.D., M.D. and B. Eddie, Dr.P.H.

Lymphogranuloma Venereum
Geoffrey Rake, M.B.

Trachoma and Inclusion Blennorrhea
Phillips Thygeson, M.D.

Meat . . . and the Newer Approach to Obesity

The management of obesity, frequently termed the most prevalent form of malnutrition, has undergone marked change in recent years. Formerly treated by means of severe dietary curtailment, the unattractiveness of which usually defeated its intended purpose, overweight today is combated by means of a dietary characterized by its liberality.

In a recently reported study,[1] a group of obese patients were placed on a diet extremely high in protein and low in fat and carbohydrate. Food quantities were not measured, and patients were allowed to partake *ad libitum* of the specified foods. A mainstay of the diet was lean meat—two servings daily each of twice normal size—and other sources of protein such as fish, fowl, skim milk, and eggs. Weight reductions in excess of 100 pounds were recorded. The author emphasizes that blood pressure elevation due to the diet was not noted, and in some cases the blood pressure fell.

Similar results are reported in another study[2] in which the diet provided liberal amounts of meat as the source of protein. Meat is universally specified in the sound weight reduction program for the following reasons: (1) It contributes generous amounts of biologically complete protein; (2) Properly prepared, it can be served with a minimum of fat; (3) It makes a generous contribution of B-complex vitamins;[3] (4) It ranks high in satiety value, an extremely important consideration; (5) It provides endless variety to the diet, thus reducing the hardship and encouraging faithfulness.

DIFCO

DETECTION OF THE GONOCOCCUS

The superiority of the cultural method over the usual microscopic technique for detection of gonococcal infections has repeatedly been demonstrated. The cultural method is especially indicated in chronic and treated cases and for determining the release of patients. The use of the following standardized materials has simplified the diagnosis of gonorrhoea by the cultural method.

BACTO-G C MEDIUM BASE
enriched with Bacto-Hemoglobin and Bacto-Supplement A or Bacto-Supplement B is the most suitable medium available for cultural detection of *Neisseria gonorrhoeae* from all types of gonococcal infections. This new medium requires only 24 hours incubation. Upon this medium gonococcus colonies may be detected even when the organisms are present in the exudate in such small numbers that they may be missed upon microscopic examination.

BACTO-PROTEOSE NO. 3 AGAR
enriched with Bacto-Hemoglobin is the original medium developed by Difco for isolation of the gonococcus and has been widely used for many years.

BACTO-SUPPLEMENT A
BACTO-SUPPLEMENT B
were developed as enrichments for chocolate agar prepared from Bacto-G C Medium Base or Bacto-Proteose No. 3 Agar with Bacto-Hemoglobin to furnish the essential growth factors required by some strains of *Neisseria gonorrhoeae.*

PROTEOSE PEPTONE NO. 3
is the basic ingredient of Bacto-G C Medium Base and Bacto-Proteose No. 3 Agar. This peptone, in a saline solution, is also recommended as a diluent for suspending the exudate prior to inoculation on chocolate agar.

BACTO-HEMOGLOBIN
in a two per cent solution is the preferred enrichment for preparation of chocolate agar from Bacto-G C Medium Base or Bacto-Proteose No. 3 Agar. It is readily soluble in water and is sterilized in the autoclave.

BACTO-DEXTROSE STARCH AGAR
is a very useful medium for propagation of pure cultures of the gonococcus. The organism grows luxuriantly upon this medium without further enrichment. Bacto-Dextrose Starch Agar also supports excellent growth of many other pathogenic bacteria and when used in half strength it is well suited for maintaining stock cultures.

BACTO-PHENOL RED MEDIA
are particularly useful for determination of fermentative reactions of newly isolated strains of the gonococcus. A selected group of complete agar and broth media are available, as are also the basic media without carbohydrate.

Leaflet No. 121 "Diagnosis of Gonococcal Infections by the Cultural Method" available upon request.

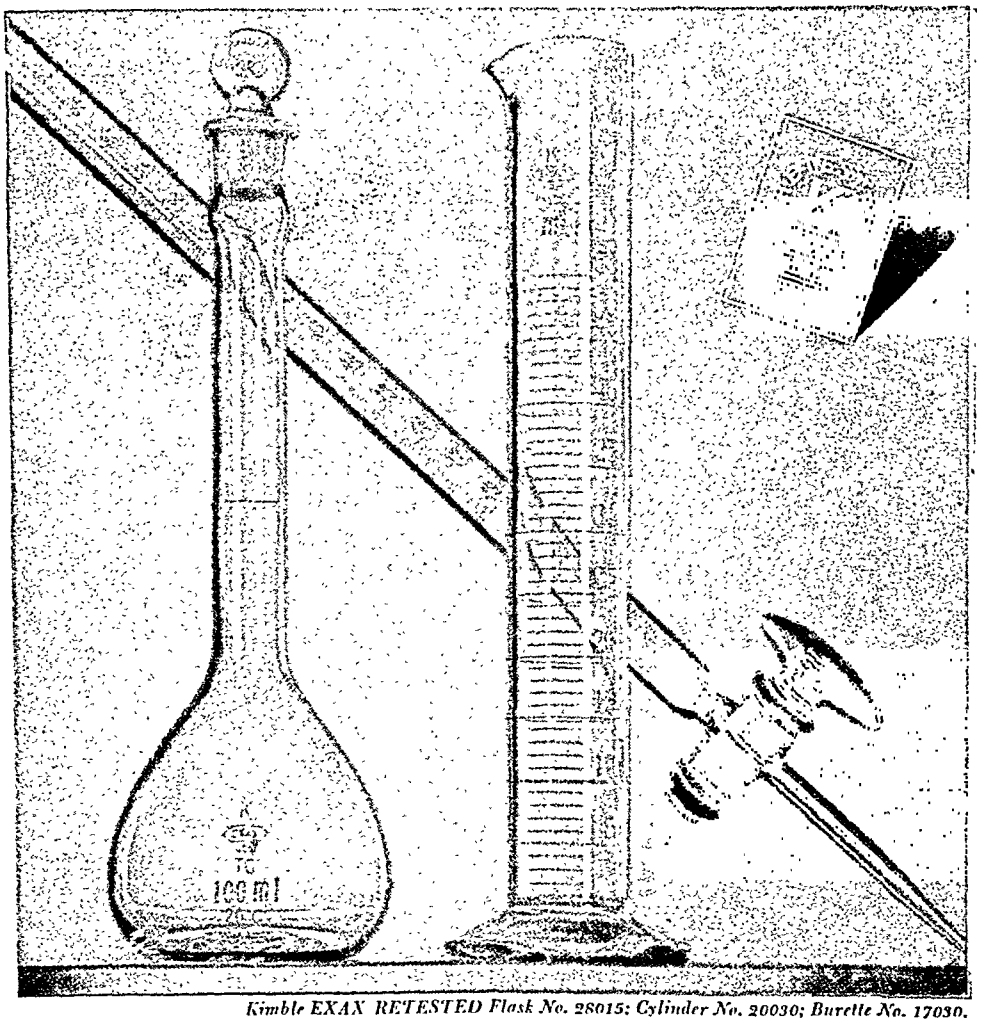
7 features to give you better performance



ADAMS 12-PLACE SAFEGUARD CENTRIFUGE

- ✓ **Sedimentation Rate**—Provides a faster sedimentation rate and more complete sedimentation with finely dispersed particles by utilizing the angle principle; tubes are suspended at a fixed 52° angle.
- ✓ **Housing**—Base and guard bowl are an integral aluminum casting which accommodates eight other types of angle and standard heads.
- ✓ **Heads**—Made of a special aluminum alloy, precision-machined for accurate balance. Can also be used for micro and semi-micro work by substituting the proper shields and tubes.
- ✓ **Speed**—Maximum speed, fully loaded, is 3170 RPM on AC, 4350 RPM on DC.
- ✓ **Speed Control**—Rheostat has an "off" position and allows for continuous speed control.
- ✓ **Mounting**—Rubber suction feet absorb vibration and keep the unit from creeping, even on glass. Tabs for permanent mounting are also available.
- ✓ **Finish**—Attractive gray hammertone.

CT-1230/D Adams Safeguard Angle-Head Centrifuge, 12 Place; complete with head and shields, but without glassware; for 110 volt AC-DC.....each $105.00
220 volt models, $3.00 additional

Write for Circular 309 PH, describing our complete line of centrifuges.

Kimble EXAX RETESTED Flask No. 28015; Cylinder No. 20030; Burette No. 17030.

There's no substitute for EXAX RETESTED quality

EXAX RETESTED is America's No. 1 choice for accurate laboratory determinations simply because it is made and intended for that purpose. EXAX won't bounce, but it is thoroughly annealed for toughness . . . will stand everyday handling and usage.

The great value of EXAX RETESTED lies in certain exclusive advantages. It is a special formula of glass, precision-made by specialty craftsmen. The fine deep graduations are of a type which readily accepts the permanent fused-in blue filler. *And* . . . all calibrations are marked and checked and *retested* with standards of highest precision.

So remember, if accuracy and fitness for the job are important, there is no substitute for EXAX RETESTED glassware.

Look for the Kimble "K", the visible guarantee of invisible quality.

Delayed release...

Just as a great dam stores and releases water only as fast as the fertile lands below can utilize it, so does Alhydrox* adsorb antigens and release them *slowly* from tissue after injection. This gives the effect of continuous small doses.

Alhydrox is a Cutter exclusive—developed and used by Cutter for its vaccines and toxoids. It supplements the physician's skill by producing these immunizing advantages:

1. *Alhydrox selectivity controls the absorption of antigens, reducing dosage volume while building a high antibody concentration.*

2. *Alhydrox, because of its favorable pH, lessens pain on injection and reduces side reactions to a minimum.*

3. *Alhydrox adsorbed antigens are released slowly from tissue, giving the effect of small repeated doses.*

** Trade name for Aluminum Hydroxide Adsorbed*

Specify these Cutter **Alhydrox** *Vaccines:*

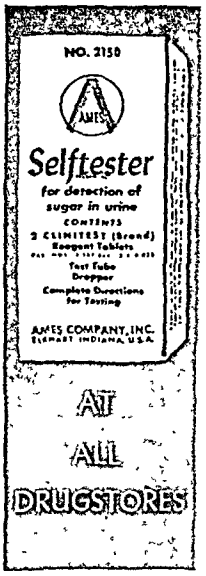
delayed diagnosis

is enemy number one of

DIABETICS

A million or more diabetics are undetected and untreated.† But only about 55,000 new cases are being discovered each year in the course of insurance examinations and routine checkups. Early diagnosis and prompt treatment give the physician his best opportunity to ameliorate the disease and to avert or delay its complications.



An urgent problem

How shall the unknown diabetic be detected and directed to the doctor's office for diagnosis and proper treatment?

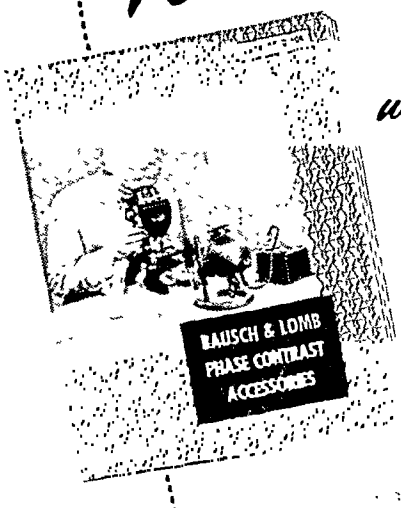
An important answer

AMES *Selftester*©

a quick home screening test that brings those with glycosuria to you for diagnosis

The Ames Selftester for detection of sugar in urine is approved by the Council of the American Diabetes Association. It is a simple, reliable screening test to establish the presence or absence of urine-sugar and "refer" those with glycosuria to you for diagnosis.

The directions state:



1. **The Selftester does not diagnose diabetes or any other disease.** Its sole function is the detection of sugar (glucose) or sugar-like substances
2. **If reaction is positive, see your doctor at once.** Sugar in your urine does not necessarily mean you have diabetes (nor does a negative result definitely exclude the presence of disease). But only your doctor, by medical examination and by additional laboratory tests, can tell you why you show sugar.

SO WONDERFULLY CONVENIENT!

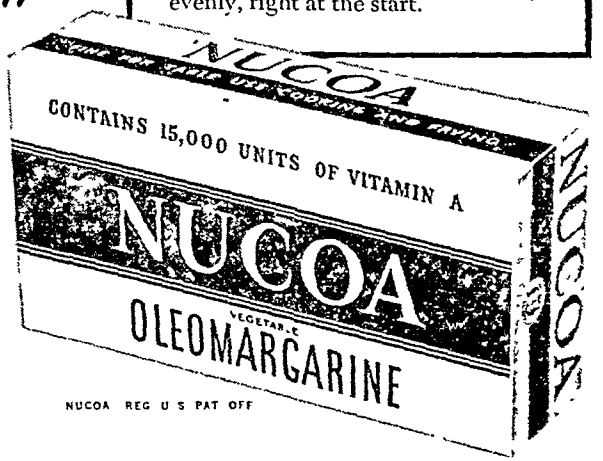
NUCOA

in the NEW Measure-Pak

EASY MEASURING GUIDE

1 print = ½ cup

½ print = ¼ cup



¼ print = 2 TABLE-SPOONS

Short Cut to "bowl-mixing"!

A two-pound bowl-mix is easier than ever—thanks to the new Measure-Pak. You don't have to soften a *solid* block before you begin, it reaches the right mixing temperature faster and more evenly, and it's easier to distribute the pure color wafer evenly, right at the start.

NEWEST REASON YET FOR COOKING WITH NUCOA

Measure-Pak Nucoa in ¼-lb. prints does away with slow, bothersome spoon-and-cup measuring for good. Just use Nucoa quarters as a scale, and get the exact amount your recipe calls for. A favorite with nutritionists for over 30 years, delicious, churn-fresh Nucoa margarine is enriched with 15,000 units of Vitamin A per pound.

ONLY NUCOA — AMERICA'S LARGEST-SELLING MARGARINE

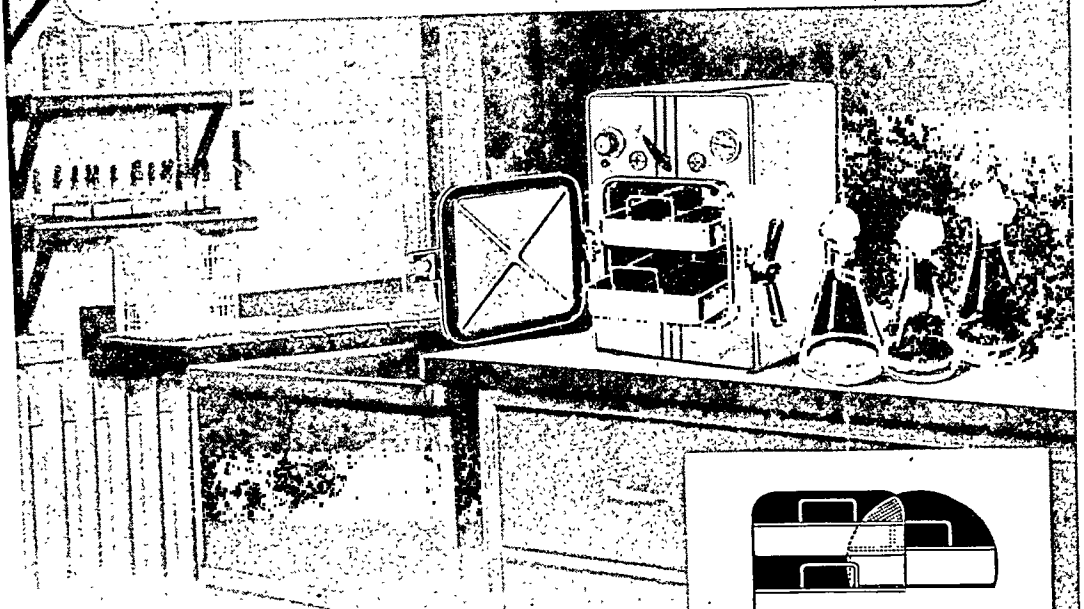
● There are several good reasons why OWD Ritespoons are solving sanitation problems in countless food service operations.

● The OWD Ritespoon meets a far wider range of requirement than all other single service eating utensils combined. More food vendors can employ it.

● OWD Ritespoon is a true single service spoon—it does not invite repeated use after a superficial cleansing. It is used once only and thrown away.



● Made of Northern hardwood in the true shape and with the full bowl capacity of metal ware OWD Ritespoons give equally good service in both hot and cold foods and drinks. Strong, rigid, smooth. Tasteless and odorless. 4 sizes and OWD Ritefork We will gladly send samples.

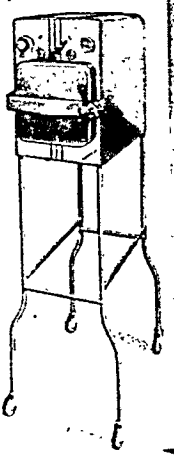
Ideal for the laboratory!

The "American" Model 8816
All-purpose JUNIOR AUTOCLAVE



Provides 100% Greater Load Capacity

Comparison of conventional cylindrical chamber with new rectangular type illustrates increased capacity for accommodation of 2 instrument trays instead of one.

- PORTABLE . . . simply insert plug in convenient electrical outlet and operate . . . no piping or waste connections are required.
- The unit is fully automatic . . . plus automatic "Burn-out-proof" safety.
- Trays may be readily removed for accommodation of flasks and full chamber capacity loads.
- Unit may be conveyed from room to room and placed on any flat surface for operation at actual place of work.

Important to the laboratory technician—

The need for a supplementary autoclave of small size is answered by the Model 8816 for the sterilization of instruments, bacteriologic media, wrapped supplies and allied loads.

Mobile Stand . . . saves steps. Move autoclave to point of work in the laboratory!

Warburg Apparatus

TEMPERATURE CONTROL: The constant temperature water bath has a temperature range from room temperature to 60° C., with a guaranteed sensitivity ± 0.02° C. An adjustable thermo regulator in conjunction with a sealed relay mounted in control box, and a 1/30 H. P. stirrer insure uniform and accurate temperature throughout the bath. The adjustable thermo regulator permits the operator to change temperature at will, and will respond to temperature changes of less than ± .01° C. Double wall construction of the bath reduces radiation losses and decreases fluctuations due to changing ambient conditions. Guaranteed uniformity of temperature through the bath is ± .02° C.

SHAKING MECHANISM: This apparatus incorporates an improved noiseless shaking mechanism for the manometers and reaction vessels. The 5 arms are pivoted on rubber hinges, eliminating all metal joints and lubricating problems. Each arm carrying two dovetail sockets to hold two manometers. A ¼ H.P. motor is used for driving the reciprocating mechanism.

EASE OF READING: Manometers are always in focus and can be easily read while being shaken; or, if desired, each pair of manometers can be stopped at will while others are operating.

MANOMETER HOLDERS: All manometer holders are made of stainless steel, properly re-inforced to provide rigid supports for the glass manometers. They have a built-in guard which prevents breakage while manometers are operating. Each manometer holder has 1 clamp for adjusting the liquid level.

The new "Precision" 10-unit Barcroft-Warburg apparatus is designed to provide laboratories engaged in Barcroft-Warburg work with an accurate time saving and space saving apparatus that will aid technicians in obtaining the best possible results in the shortest period of time.

USES

1. The apparatus is used for measuring respiratory exchange in yeast, bacteria spores, plant and animal tissues and for the measurement of lactic acid production by normal and tumor tissues.
2. For reactions in which acid or alkali is produced or consumed in bicarbonate solutions in equilibrium with CO_2 gas mixtures.
3. For the measurement of blood gases and for investigating the reactions of hemoglobin and other blood pigments.

CAPACITY: The "Precision" Warburg Apparatus is a rectangular unit and will accommodate 10 standard Warburg manometers or 5 Summerson differential manometers on the front panel.

ADJUSTMENT: Amplitude of shaking of manometers is adjustable from 0 to 4 cm.; the speed is adjustable from 50 to 150 oscillations per minute by an external knob operating a silent, variable speed "V" belt drive.

CONSTRUCTION: The interior and exterior of the Warburg bath is made of stainless steel and is of double wall construction, insulated throughout. Manometer holders are made of stainless steel with white plastic strips to facilitate reading. Heating of the bath is provided by immersion heaters, one connected to a quick heat switch, and the other connected to the thermo-regulator and relay.

Mounted on top of the bath is a ½" transite insulating panel, enclosing approximately ½ of the top area of the bath, which reduces radiation losses, improves temperature control, and also acts as a support for the thermo-regulator, control box, electric heater, special thermometer and stirrer. All wiring is fully enclosed.

Mounted on the metal base is the complete operating mechanism.

STANDARD EQUIPMENT: Bath with stainless interior and exterior; immersion heaters; 1/30 H.P. Stirrer; ¼ H.P. variable "V" belt drive motor; thermo-regulator; relay in control box; line switch; special thermometer, 25° to 40° C. in 1/10th divisions stainless steel Warburg manometer supports and one 10 unit stand for supporting manometers.

OVERALL DIMENSIONS: 17" deep, 32" high, 38" long.

WORKING CHAMBER DIMENSIONS: 9" deep, 11" high, 36" long.

Cat. No.	DATA FOR ORDERING	PRICE

Smith-Gray, Jen-Cel-Lite and The 1949 A.P.H.A. Convention

Smith-Gray is proud to invite Public Health Officials. Public Health Nurses. and all those interested in the Public Health Nursing field who may be in attendance at the 77th Annual Meeting of the American Public Health Association, to visit Display Booth 140 on the Second Mezzanine of the Hotel Statler.

We will introduce to you, for your use and comfort, the most outstanding development in the uniform industry—a remarkable lining called Jen-Cel-Lite. Although light as a feather, Jen-Cel-Lite insulates the coat so completely that a lighter weight material may be used for the coat and still provide perfect 'Warmth Without Weight'.

Smith-Gray has the exclusive rights to Jen-Cel-Lite for the Uniform Industry. ONLY Smith-Gray can make you a coat with a Jen-Cel-Lite lining. This lining has a center insulation and is faced on both sides with windproof taffeta. This scientific discovery has outmoded all coat linings used heretofore. The Jen-Cel-Lite lining for your Smith-Gray coat may be made permanent or zip-in.

Jen-Cel-Lite provides 'Air-Cell Insulation', which spells 'Comfort in Any Climate'. Smith-Gray coats with Jen-Cel-Lite linings will enable Public Health Nurses to enjoy perfect 'Warmth Without Weight' next winter for the *first time!*

Please write us for an order-measure form if you desire to place an order before the Annual Convention. All Smith-Gray garments are skillfully custom-tailored to individual measurements. Four weeks delivery.

Now there are TWO Dacro P-38 Caps...

An air-tight seal as well as a cover cap. Because it is made of steel, this cap is exceptionally strong and durable. It is also tamper-proof. Easily removed in the home with the special Dacro Opener. Makes a perfect re-seal, which may be snapped back on the bottle as often as needed.

An air-tight seal as well as a cover cap. Because aluminum is somewhat softer than steel, this cap may be removed by hand, thus eliminating the need for an opener in distribution to stores and schools. Makes an excellent re-seal which may be snapped back on the bottle as often as needed.

BOTH CAPS give dependable protection for the purity of bottled milk. Both caps provide the marked operating efficiency and economy which has created such an overwhelming demand for the Dacro P-38 Cap and Capping System.

Treat Filariasis Easily and Quickly with

HETRAZAN®

DIETHYLCARBAMAZINE

Lederle

The treatment of so large a portion of the population that is affected by a disease as filariasis requires a drug that is easy to administer. HETRAZAN Diethylcarbamazine *Lederle* is such a drug. It is provided in tablet form that may be given orally after meals.

The low toxicity of HETRAZAN and its high specificity for *Wuchereria bancrofti* and *Onchocerca volvulus*, its freedom from any toxic heavy metals, and its stability under varied heat and moisture conditions, make HETRAZAN Diethylcarbamazine *Lederle* the drug of choice in the treatment of filarial disease.

International

Centrifuges of Proven Performance

Size 2

When selecting your new Centrifuge—consider:

Size 1 Type SB

1 **The reliability of the electric motor that drives it.**
The motors of International Size 1 and Size 2 Centrifuges are specially designed to provide the best possible drive for a Laboratory Centrifuge. They are manufactured entirely in our own shops, thus eliminating the possibility of obsolescence through discontinuance by an "outside" manufacturer.

2 **The range of its application.**
Interchangeable accessories designed specifically for International Centrifuges are available in wide variety, making the machines adaptable to practically every laboratory application. Your future requirements as well as your present needs should be considered.

3 **The relation of first cost to total cost.**
Expensive repairs can make a low first cost a high cost in the long run. International Centrifuges are famous for their ability to give years of trouble-free service.

4. **The reputation of the manufacturer.**
International's fifty years of specialization in the manufacture of Laboratory Centrifuges is your guarantee of unequalled performance.

NOW READY . . .

LENGTH OF LIFE—A Study of the Life Table

By Louis I. Dublin, Alfred J. Lotka, and Mortimer Spiegelman, *Metropolitan Life Insurance Co.*

REVISED EDITION. This book traces and interprets the progress in health and longevity from earliest times to the present, with emphasis on the social and scientific influences that have brought about this progress. The authors have used the facilities of one of the outstanding statistical offices in the insurance business to digest the basic contributions in vital statistics, public health, and medical science as they bear on longevity.

Here is a wide range of material on the relation between longevity and family history, biological influences, body build, physical condition, medical history, and occupation. For vital statisticians, students of the social sciences, and health workers generally, there is a clearly worked-out example of a short method of computing a life table. And the volume includes the most extensive collection of life tables available in a single source.

This revised edition is virtually a new book, and brings up-to-date a work which, when it first appeared, was warmly received and widely quoted by professional workers in the social and medical sciences. *379 pages. 32 Charts. 94 tables.* $7.00

REHABILITATION OF THE HANDICAPPED

A Survey of Means and Methods

Edited by WILLIAM H. SODEN, *Executive Asst., Physical Medicine Rehabilitation Service, Veterans Administration Hospital, Northampton, Mass.*

Prepared by 45 Contributing Specialists *Foreword by Sidney Licht, M.D.*

THIS BOOK brings under one cover representative accounts, by specialists in the various phases of the rehabilitation process, of procedures in current use for the mental and physical rehabilitation of persons disabled by illness or injury. Its scope is wide, beginning with medical, surgical, and psychiatric techniques, and continuing with the vocational, social, educational, and psychological procedures which help to develop limited abilities. Among the many techniques described are those used with amputees, poliomyelitis cases, the aged and infirm, the arthritic, the psychoneurotic, alcoholics, and the blind. The authors are connected with institutions in which outstanding work is being done. The articles provide an authoritative, over-all view of latest accomplishments in the field. *399 pages.* $5.00

THE MONEY VALUE OF A MAN

By Louis I. Dublin and Alfred J. Lotka, in collaboration with Mortimer Spiegelman

DEVELOPED out of the authors' work in life insurance in determining the money value of persons at various ages according to their earnings. Of value to economists, health officers, and social workers interested in the costliness of disease and premature death; to every adult person concerned with the responsibility of family protection; to those charged with making fair awards for personal injury and incapacitation. Extensive recomputations have been made in the tables to conform to altered conditions, resulting largely from lowered interest rates and increased expectation of life of the American population. *Revised Edition. 8 Charts. 57 tables.* $6.00

WHY MANY LEADING NOSE AND THROAT SPECIALISTS SUGGEST

"change to PHILIP MORRIS"*

Where smoking is a factor in a throat condition, the physician may advise "Don't Smoke." But where the patient persists, many eminent specialists suggest "*Change to* PHILIP MORRIS"... the one cigarette proved definitely less irritating.** Perhaps you too will find it advantageous to "*Change to* PHILIP MORRIS." For *all* smokers, Philip Morris is by far the wisest choice.

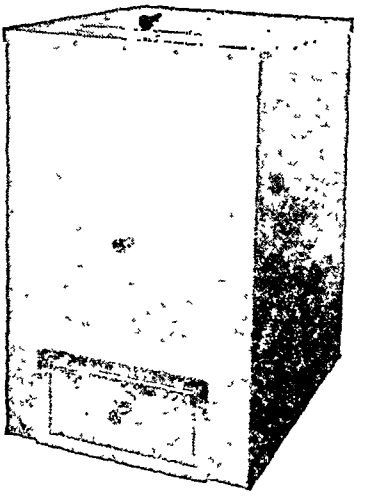
SALVAJOR EQUIPMENT

For Sanitation in Commercial Kitchens

SALVAJOR SCRAPPING & PRE-WASH MACHINE

Popular with large and small dishwashing departments. Speeds dishwashing. Saves silverware from loss in garbage. Cuts detergent costs. Helps get dishes cleaner.



WasteXit FOOD WASTE DISPOSER

Cuts and discharges all waste into sewage as flowing liquid. Eliminates garbage odor and need of refrigerated storage rooms. Helps solve fly and rat problems. In sizes and voltages to fit your needs.

New Dehydration Type WASTE DISPOSER The SALVAJOR "CONSUMALL"

An economical gas-fired unit that reduces all burnable waste to a fine powder. CONSUMALL silently dehydrates food waste, including bones, seeds, etc., with the gases created largely by the heated waste itself. Ideal for locations where grinder type garbage disposers are not yet permitted. Uses all types of gas. Single unit excellent for small operations. Double unit for larger operations. Also, units can combine for unlimited capacity.

As the Incidence of Scabies Rises

The specific, positive scabicidal properties of Kwell Ointment are employed to particular advantage during the warm summer months with their concurrent increase in the incidence of scabies. Kwell Ointment usually eradicates scabies infestation with a single application. Its action is prompt, and secondary dermatitis or skin irritation rarely follows its use. Its extreme blandness makes its application permissible even in the presence of secondary infection.

Kwell Ointment owes its scabicidal action to the gamma isomer of benzene hexachloride—0.5% in a vanishing cream base. This parasiticide is specifically lethal for Sarcoptes scabiei yet in the concentrations employed it is nontoxic to man. Available on prescription at all pharmacies in 2 oz. and 1 lb. jars.

The virtues of Kwell Ointment are discussed in the following articles:

1 Wooldridge, W E The Gamma Isomer of Hexachlorocyclohexane in the Treatment of Scabies, J Invest. Dermat *10* 363 (May) 1948

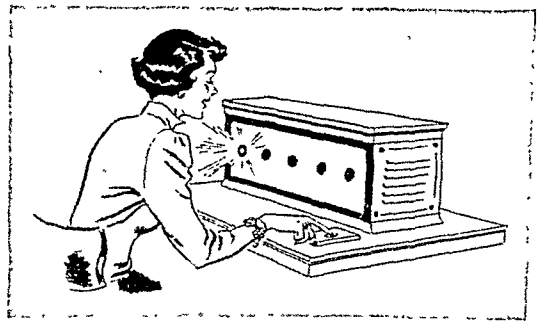
Adequate Breakfast Habits

AND MENTAL ACUITY

Recent physiologic research* conducted at the Departments of Physiology and Nutrition of an outstanding medical college has demonstrated a positive correlation between breakfast adequacy and mental acuity at the pre-noon hour. By inducing greater physiologic efficiency, breakfast routines providing 800 or 400 calories reduce the simple and choice reaction times to external stimuli whereas the habits of omitting breakfast or the taking of coffee only produce the opposite effect.

The effects of the four different breakfast practices were studied under strictly controlled conditions using six young women graduate students as subjects. Since reaction time is particularly sensitive to alterations in physiologic conditions, this test was adopted for detecting changes in the mental acuity states of the experimental subjects. The findings of the 800 calorie breakfast period were adopted as the standard base of reference.

Conclusions drawn from this important work are:



1. When no breakfast was the morning practice, a notable *increase* resulted in the duration of the simple and choice reaction times.

2. Habituation to coffee only induced a similar *increase* in reaction time.

3. When habituation to the 400 calorie breakfast was attained after the coffee only period, both simple and choice reaction times showed a noteworthy *decrease.*

This physiologic research, for the first time, presents directly derived experimental evidence supporting the recommendation long propounded by nutrition and health authorities for eating an adequate breakfast. For planning such nutritionally acceptable breakfasts the widely acclaimed basic breakfast pattern of fruit, cereal, milk, bread and butter serves as an excellent nutrient foundation.

Although not stated in the published report, the findings forcefully intimate that during the late morning greater mental acuity results from adequate breakfast practices than when omission of breakfast or coffee only is the morning habit.

The presence of this seal indicates that all nutritional statements herein have been found acceptable by the Council on Foods and Nutrition of the American Medical Association.

*Reprint of the research findings referred to will be sent on request.

More and more, research is revealing butter's nutritional role

Scientific investigation leads to new discoveries about the food value of butterfat

BUTTER, like the other members of the dairy products family, provides a combination of wholesome nutrients which contribute to the total food intake and help complete daily meals. It is one of our top providers of vitamin A, averaging 15,000 I.U. per pound, the year around, and well over 20,000 units per pound in summer Butter also is an ideal source of fat itself and contains the essential fatty acids.

In view of our present knowledge alone, butter is well established as an excellent food for young and old. But the importance of butter in the nutrition picture constantly is being expanded by research.* Scientific studies have uncovered additional nutritive properties of butter which are not yet fully defined

A New Growth Factor—One of the most significant of the current studies concerns butterfat's stimulating effect on the growth of experimental animals under certain conditions This factor is distinct from the known fat-soluble vitamins and essential fatty acids. It is peculiar to "summer" butter, but inasmuch as 65% of the butter consumed in this country is summer butter, this growth-promoting substance could well prove significant.

Vitamin Synthesis—Butterfat has been observed by several scientists to stimulate the synthesis of important vitamins by intestinal micro-organisms. Certain fractions of butterfat also have been noted to increase liver storage of vitamin A in experimental animals. The ability of certain fats and other factors to affect the dietary need for vitamins is a new and important phase of nutrition.

Further Studies Under Way—Tests are now in progress to determine the significance of butterfat itself in human nutrition. These studies will undoubtedly demonstrate whether butterfat's superior qualities are due to some essential, but still unidentified nutritional element, or to the unique and highly beneficial combination of fatty acids butter contains. We must await the results of future research for a thorough appreciation of butter's complex nutritional role.

Facts and Figures about Child Health in the United States*

A Critical Appraisal of the Academy of Pediatrics Study of Child Health Services and Pediatric Education †

KATHERINE BAIN, M.D., F.A.P.H.A., AND
HAROLD C. STUART, M.D., F.A.P.H.A.
Children's Bureau, Federal Security Agency, Washington, D. C.; and School of Public Health, Harvard University, Boston, Mass.

THE habit of seeking the postmortem room is fixed in the well trained physician. There, spread before him and his colleagues, he may see the confirmation of his theories, but also the errors of his judgment and skill. Now that the Academy study is complete it is well for those who were an integral part of its design and execution, as well as for those who can see it from outside the working circle, to review what was or was not accomplished by this vast undertaking.

If one were to generalize about the study, one would say that its chief contribution is documentation of earlier impressions. It turns opinions into facts which were anticipated. That many children have inadequate medical care, that maldistribution of doctors and hospitals exists, that many doctors who care for children are poorly trained in this care—all these were known in a general way to people who were well informed. Now these opinions are backed up by a wealth of data. Chapter and verse can be cited. The inadequacy of child health services has been taken out of the area of controversy and put in the realm of established fact.

RESUMÉ OF FINDINGS

The results of a 3 year nation-wide study, covering all physicians and dentists in private practice, all hospitals caring for children, and all community health services of certain categories, cannot be covered in a few brief paragraphs. Only the highlights are given here.

* Special Review Article, prepared at the request of the Editorial Board.

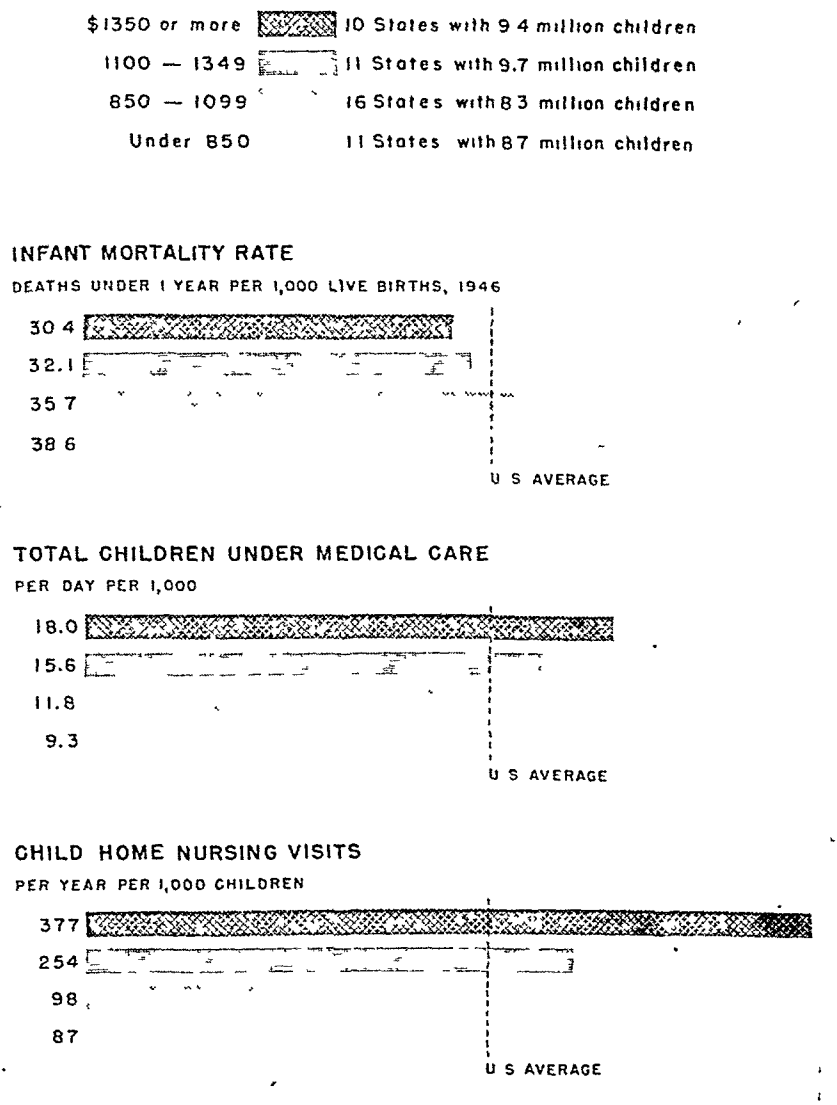
† As a basis for post-war planning, the American Academy of Pediatrics in 1945 undertook a nation-wide study of child health services, with the co-operation of the Public Health Service and the Children's Bureau of the Federal Security Agency. The study was completed in 1948, and the report published April, 1949, by the Commonwealth Fund.[1]

The study showed that children in or near cities receive far more medical care than children living away from cities, and that similar discrepancies exist among states and among the regions of the country. Not only is the city child at an advantage in amount of care, he is also at an advantage in kind of care. Available to him are relatively more specialists, more and better hospitals, more clinics. Since no area of the country appears to have too much medical care designed to meet the needs of children, these findings show clearly the need for more doctors, more hospitals, and more community health services for them.

In addition to the fact that there are not enough hospital beds for children, the study shows that much hospital care is of poor quality. A large part of the hospital care of children is given in hospitals where infants are not separated from older children and where there is no house staff. Often—in the case of one-fourth of the admissions—children are not even separated from adults. Large numbers of infants are born in hospitals which do not have staff and facilities to safeguard health. Thus, 61 per cent of hospital births are in hospitals that have no new-born nursery for sick infants separate from well infants, and 40 per cent in hospitals with no house staff.

To the city dweller, familiar with the hospital clinic, it is surprising to learn that for the total United States only 16 per cent of general hospitals have an outpatient department. In the small community such clinics are almost nonexistent.

One of the common beliefs—that community health services fill the gap for those unable to obtain private medical care—was shown to be groundless by this study. Only 1.7 per cent of the total volume of medical care rendered to children is given through community health services.



Well child conferences are often thought of as a major part of child health supervision. During the year of the study there were 160,000 sessions. Yet 2,000 counties, representing 31 per cent of the children under 5 years of age, had no well child conference. For the country as a whole, only 6 per cent of the children under 5 received service in well child conferences. Variations from state to state both in amount and in kind are tremendous.

School health services which are supposed to carry on where well child supervision leaves off were almost as inadequate. Using as evidence of a school medical service the very low criterion of any examinations (other than for athletic teams) done at the school by a physician, we find that over half the counties had not one public elementary school with such service. These counties represent 22 per cent of the children in the 5–14 age group.

For years, students of the question have been saying, without proof, that the pediatrician sees relatively few of the nation's children. The study adequately assesses the relative importance of the general practitioner and the pediatrician in terms of amount of care given children by each. Out of 100 visits to children, 75 are made by the general practitioner. He carries the bulk of well child supervision as well as sick care. In preparation for these tasks, his training is often inadequate; 17 per cent of the general practitioners had received no hospital training of any kind, and nearly half had had little or no hospital training in pediatrics.

If one has time to read only a small part of the report, we suggest Chapter 7, for here is the interpretation of the meaning of the study. The states have been divided into four groups by economic status and the major findings of the study portrayed graphically in relation to these groupings. The relationship between quantity and quality of

HEALTH SERVICES FOR CHILDREN IN RELATION TO THE ECONOMIC LEVEL OF THE STATES

Adopted from Chart 77 in "Child Health Services and Pediatric Education," Report of the Committee for the Study of Child Health Services, The American Academy of Pediatrics; published by The Commonwealth Fund.

care and economic status is so striking and so consistent that one cannot escape the implication. The three charts in Figure 1 portray this relationship more clearly than can be done by words. Full documentation is given by this chapter to one of the causes for lack of medical care to children as formulated by the Academy before the study, namely, "The parents are unable to pay for services."[2]

In addition to these general findings, many new pieces of information were produced by the study. Strangely enough, no prior data existed on the number of children cared for in hospitals, or on the days of care given to children. The fact, not appreciated before, that more days of care are now given by hospitals to new-borns than to sick children is an important item for planning. The Academy study gave us our first nation-wide figure on the incidence of breast feeding[3] and on the fatality rate in hospitals among infants born prematurely.[4] It gave the first comprehensive figure on average daily case load of general practitioners and of pediatricians throughout the total United States and by regions. For the general practitioner, the average number of patients seen in one day is 16.4. This average is not of his working days but of all days in the year—Sundays, holidays, vacations, and sick leave included. Many more than 16 patients must be seen on some days to counterbalance the days when no patients are seen. Twenty per cent of the general practitioners recorded more than 30 visits on the day of their report, and 5 per cent reported more than 50 visits. It is quite apparent that, if the volume of medical care is to be increased in this country without reduction in the present quality of care, more physicians must be produced. Hundreds of similar individual items could be listed about which data were obtained for the first time on a nation-wide scale.

UNIQUE TECHNICAL CONTRIBUTIONS OF THE STUDY

Technically there are many interesting aspects of this study. It was the first nation-wide study of health services for any segment of our population. The determination to make it a mass survey was taken on the grounds that in addition to gathering facts for national planning, it had among its purposes also the enlisting of wide professional and lay participation and the gathering of data for local planning. For the purpose of obtaining national data, a sample carefully selected and recorded by well trained workers would have yielded more accurate results. The state material, gathered as it was by people of widely varying competence, even though on standard forms and with standard directions, shows great variability. Some states did not collect all material, and others elected to get the data in their own unique way. On the whole, however, the volume of the material is such that variations and errors are lost in the mass.

The collection of a one day record from a large percentage of the practising physicians and dentists is a real achievement. Mail questionnaires requiring the recording of data usually yield a low percentage of returns. Due to the activity of pediatricians in local areas, coöperation of the doctors was excellent. Under the guidance of an expert statistical advisory committee, supplemental studies were set up to obtain seasonal and non-reporting coefficients which have made this material sound and usable.

Another unique contribution of the study to public health methods warrants special mention. Early in the undertaking it became apparent to the group responsible for the analysis of the material that some index would be needed to express quantity of care received by children. For this purpose the term "total volume of medical care" was

coined, representing the simple addition of number of physicians' visits, number of days of hospital care, and number of clinic visits. This index was expressed in terms of an average day and related to the child population for the nation, or for states, or for selected areas. Because the study obtained data on which total coverage was computed—visits by all physicians, and all hospital and clinic data—such a device was possible. This relatively simple technique, though admittedly weak from some standpoints, nevertheless, provided a basis for comparing the amount of care given in different states and areas and served the purpose of a yardstick in lieu of standards of care. Through this device deficiencies can be shown indirectly. For example, the rate of children under medical care on one day per 1,000 children in the population for New York was 21.9, for Mississippi 7.7. A similar device for dental care showed 7.2 children per 1,000 under dental care in one day in the state with the highest rate; only 0.9 at the other end of the scale.

The technique of organization and administration of the study has been dwelt on in many presentations, but is worth repeating here. Historically, this is the first mass venture in which private practitioners of medicine and government agencies coöperated. This was not, however, as some suppose, a *joint* undertaking between government and voluntary groups. This was the Academy's study, with the technical (and financial) coöperation of the Public Health Service and the Children's Bureau. In many ways it may have been better so, for this plan placed responsibility on the physicians of the country for finding answers to many of the perplexing questions of how to get more and better medical care to children. The element of coöperation in this fact finding venture may have served to develop a warmer and more trusting relationship between government and private medicine. Further benefits of the joining of hands of private enterprise and agencies responsible to the public should be explored.

Contrary to the practice in most large studies, this one has processed and made available all the usable material gathered. Volume I [1] published in April, 1949, and Volume II [5] to appear shortly thereafter contain all the pertinent material except a few special studies which have appeared or will appear soon as special papers. Most studies end with quantities of items on punch cards, which somebody plans sometime to do something about. With the close of this study, all the cards could be destroyed without loss to the public of any significant items. In addition, state material in considerable detail has all been returned to the states for local use and for the writing of state reports.* How useful this state material may be yet remains to be seen. Because all states followed in general the same pattern in the collection of data in order to produce the national picture, the material is less useful to some states than if it had been designed to meet their special needs. The "high level" states might have profited individually by concentrating on studies of special problems, but, had they done so, at the neglect of the basic material the total study for the country would have been less valuable.

PEDIATRIC EDUCATION

The section on pediatric education is less unique than the study of services, for it is not the first study of its kind. Yet it far outranks previous studies of medical education in its completeness and its focus on quality of teaching, though covering only one specialty. Unlike the rest of the Academy study, this part was carried out largely by one

* As of May 1, 1949, 9 state reports had been published, and at least 14 others were known to be in progress.

person. As in the rest of the study, yardsticks or criteria of adequacy were not developed. No attempt was made to describe what constitutes good pediatric teaching. A rating scheme was developed and the schools were ranked accordingly, though not identified. Each school has been informed of its rank and of the items which went into its making, so that the responsible persons may take steps to bring their schools in line with the top ranking ones. Much information was obtained of a subjective nature on the character of pediatric education, on new practices in teaching, and on student reactions. It is hoped that the Academy will make this available as the impressions of a competent observer even though not based on quantitative data.

WHAT THE STUDY DID NOT ACCOMPLISH

On the other side of the ledger, may be itemized some of the things the study did not do. On hearing the study described, one gathers the impression that some people think all the data necessary for future planning have been obtained. Vast as the undertaking was, it has but scratched the surface of what we need to know. There is, for example, very little material in it on quality of care except as it shows up in quantity. Attempts were made to gather data on this aspect but quality lends itself less readily to appraisal than does quantity. Techniques for determining quality of medical care need to be developed for use in studies of this kind. If doctors are to insure high quality of care in public programs, methods for appraising quality of care must be developed.

Perhaps the major lack in the report is the failure to employ standards of care as a point of reference. The Committee for the Study of Child Health Services decided not to attempt to say what constitutes good care. The study was intended to report what exists, not what the deficiencies are. For this reason the text was prepared somewhat in a vacuum. How many doctors there are per 1,000 children, or how many hospital beds, or how many public health nurses have less meaning than they would have, if measured against how many of each are necessary for good practice. Without benefit of standards, the group analyzing the material had to utilize the highest area, largest amount, or greatest number as yardsticks. To those who would like comparisons of the present state of child health services with a reasonable or possibly attainable optimum, the report is not very satisfying.

The study, as is only natural in such a comprehensive undertaking, has areas which are less valuable than others. The poorest section is undoubtedly that which deals with community health services. It has been said repeatedly that this is a study "of physicians by physicians." Naturally their greatest interests and emphases were private practice and hospital care. The community health services section completed the picture for total volume of care, but hardly goes beyond that. Each item in this section—school health services, public health nursing, mental hygiene, and so forth—needs to be the subject of a special study by the groups who are concerned with these programs. Readers of the report should bear in mind that the data gathered on these programs were for the purpose of rounding out the total picture and were in no way meant to represent comprehensive studies of these activities.

Data on nursing are almost completely lacking, as are those on health education. The Academy study was limited to services and facilities. One would hope for a companion study concerned with recipients of care.

RESULTS TO DATE

As an instrument for arousing public interest, the study has been extraordi-

narily effective. In all parts of the country, people, doctors, and laymen have looked at their health services for children and by the very act of appraisal have been moved to do something to improve them. No measure can ever be made of the extent of the changes in local communities. The questionnaires themselves, by the questions they asked about hospital techniques, are said to have produced changes in care. One state has used the information from the study effectively in securing legislation for a new children's hospital. State committees are making recommendations based on study findings for improving their services at the state and local level.

PLANS FOR THE FUTURE

This was a nation-wide study, and as such should be expected to produce national planning. State reports have given facts and, on the basis of these facts, have made recommendations. The national report was produced without recommendation, on the assumption that the Committee for the Improvement of Child Health * would take leadership in the field of planning.

The study is now complete and the country eagerly awaits the blue print for further action. The mere presentation of fact is one way of initiating progress, and the Academy of Pediatrics is to be congratulated on having furnished the facts. But someone must use these for constructive planning. It is clear that more doctors, better training for them, more equitable distribution of services and facilities are needed. But how? The Committee for the Improvement of Child Health will be called upon to do more than generalize. They will be expected to come out, and soon, with a long-range plan, with priorities of course for action. Their suggestion [6] that we need more doctors is a first step, but many other questions about the next steps will undoubtedly soon be asked by professional and citizen groups of all kinds who are interested in improving child health, and perhaps may even be asked by the taxpayer who in one way or another supported the study.

The plan for action must be broad in scope and have real substance if it is to accomplish its purposes fully: not merely to improve the health of children here and there as circumstances readily permit, but to assure that children generally are provided with all necessary health and medical services. Increasing the supply and improving the distribution of doctors well trained in child care appear to be the first and most basic steps to be taken, but concurrently provision must be made for overcoming economic, educational, and other barriers to better care for children. Any system devised to meet the deficiencies in "quantity" of services rendered to children, which merely succeeded in spreading mediocre "quality" services more evenly, would be of questionable benefit. A visit to a physician's office or a health conference may or may not be rewarding to mother or child. A harder task for those seeking action will be to assure that new services are good services and contain the seeds of self improvement so that they will go forward with advancing knowledge. Just as the original $10,000 provided for initiating the study of Child Health Services grew into more than $1,000,000 for carrying it to completion, so it must be anticipated that the groups now seeking action will require new recruits and expanding support.

* This committee was established by the Academy of Pediatrics with a full-time Executive Director and staff to make recommendations on the basis of the report and to help implement their recommendations.

Dr. Lombard States Major Cancer Control Problems

H. C. Lombard, M.D., Director of the Division of Cancer and other Chronic Diseases of the Massachusetts State Department of Health, at the recent Amherst meeting of the Massachusetts Public Health Association, listed the following major problems in the field of cancer control:

I. Lack of knowledge regarding the disease—
   1. What occupations subject the worker to carcinogenic agents?
   2. What other activities subject the individual to carcinogenic agents?
   3. Is there a constitutional factor in cancer etiology?
   4. Is the constitution of the individual a factor that will influence his response to therapy?
   5. Why does economic status influence the incidence of cancer and the results of treatment?
   6. Is the milk factor of importance in human cancer?
   7. Why does early marriage predispose to cancer of the cervix?
   8. What habits of the individual predispose him to cancer?
   9. What differences in incidence exist in various geographic areas?
   10. How much of a factor is heredity in the etiology of human cancer?

II. Attitudes of the public regarding the disease—
   1. Fear
   2. Superstitions

III. Sociological problems—
   1. Ignorance
   2. Poverty

IV. Administrative problems—
   1. Lack of qualified personnel
   2. Lack of sufficient funds
   3. Lack of accurate tests for the early detection of all cancers
   4. Lack of sufficient accurate data concerning incidence, end results, etc.
   5. Lack of general understanding that control necessitates the combined energies of clinicians, research workers, and public health personnel
   6. The failure of present methods of indoctrinating all physicians in the early detection of the disease.

The Nursing Home— A Medical Care Facility*

JOSEPH H. KINNAMAN, M.D., M.P.H., F.A.P.H.A.
Deputy Commissioner, Nassau County Department of Health, Mineola, N. Y.

SOCIAL workers know that the demands for medical, nursing, and custodial services outside the individual's own home are increasing.

Care of the chronically ill and aged infirm outside of a private home or a hospital is usually given in facilities that have been termed by Rogers as "nursing infirmaries," by Wagner as "between home and hospital facilities," and by Griffin as "commercial homes."

A nursing home should be a safe, sanitary private or public medical care facility, operating under health department licensure and having medical services affiliated with the staff of a secondary hospital center. Personnel of a nursing home should be prepared by training and experience to render, under medical supervision, preventive, medical, health, and social services based on the total needs of sick, infirm, or handicapped persons, not requiring hospitalization. The goal of nursing home care should be to make available to the patient the maximum opportunity for rehabilitation, and, whenever possible, resumption of a happy, economically useful life in his own home.

Few privately operated nursing homes in the metropolitan area of New York presently meet all of the requirements contained in that definition. Actually, they are rarely if ever adequate to meet the needs. All too frequently these homes provide a poor quality of care. Needs of the older persons in them are seldom the basis for service. The cost to the individual (and to the taxpayer, since public recipients are commonly placed in these homes) bears little if any relationship to the quantity and quality of care given. Nursing homes are almost invariably conducted in large buildings, usually constructed of wood or other combustible material, that were intended for some other use, especially as single family dwellings. Operators and employees are rarely required to be qualified through training and experience in meeting the medical-social problems of the chronically ill. Nurses of one kind or another usually operate nursing homes. Commonly such homes provide only shelter, board, and some nursing care.

Potter[1, 2] and Jarrett[3] have discussed other shortcomings of presently available facilities of this type, and they have also suggested remedies.

Widespread support is developing for several basic concepts regarding care for chronically ill persons who cannot or should not remain at home, and who do not require hospitalization. The total needs of long-term patients can be met only if homes for the aged, boarding, convalescent, and nursing homes are available to them. Both tax supported and privately owned facilities of these types are now generally insufficient to meet the demands for care outside the home and hospital. Some communities are now operating public nursing homes.

* Presented at a Conference of the Area Supervisors of Welfare Institutions, New York State Department of Social Welfare, New York, N. Y., December 9, 1948.

Many other cities and counties are planning such facilities. These planners should consider the effect of an aging population on the need for nursing home care. Barring wars, life expectancy is certain to lengthen appreciably in the future. This means that persons 45 years and over will comprise an increasingly larger proportion of the total population. The prevalence of chronic disease becomes greater as a population ages. The ratio of women to men in nursing homes is presently about 4 to 1. An older married woman is likely to live nearly 8 years longer than her husband.

To make an effective and necessary contribution to the general medical care program of a community, all types of "between the home and hospital" facilities should meet minimum standards, be regularly inspected, serve the total needs of the persons in them, and conserve the financial resources of patrons by basing charges on services actually required at a given time.

The Public Health Ordinance of Nassau County, New York, provides for the licensure of nursing homes. It became effective October 1, 1941. The provisions are essentially the same as those adopted previously by New York City. That ordinance falls short of being a model. So do most others having the same purpose. Whoever attempts to improve such ordinances should keep several general considerations in mind.

First, all types of facilities caring for the sick, infirm, handicapped, and aged, either for a consideration or at the expense of the taxpayer, should be subject to inspection and supervision by the health department.

Second, provision for probationary licensure of "care" homes is an essential inclusion in a licensure law. The health authorities in Nassau County, New York, agree with Potter and others that this is an effective method of raising standards.[1] The public, operators, and licensing agency benefit. This device reduces the number of illegal operators, makes more facilities available, enables the licensing agency to make education rather than enforcement the keynote of supervision, and helps to establish the important relationship between cost of care and quality of services.

Third, it is unrealistic and uneconomic to make the minimal standards, including fire and safety requirements, identical for supervised boarding homes for older persons and for nursing homes. The condition of the patients in them is the best criterion for regulations. The ordinance should make it a violation for an operator of a boarding home for older persons to accept or to keep any person who is unable to get about without help, or who has a demonstrable physical or mental disease, disability, or infirmity which, in medical opinion, constitutes an indication for attendant or nursing service. The ordinance should make it a violation for an operator of a nursing home to accept or to keep any person who, in medical opinion, requires hospitalization. These requirements take into account the fact that the condition of patients changes with time.

Fourth, all nursing homes require medical services affiliated with the staff of a secondary hospital center.[4] Additional benefits accrue to patients and facilities when both hospital and nursing homes have affiliations with supervised boarding homes for older persons. The advantages of affiliations between all types of "care" facilities show up best when one compares the total services now generally given with those available under that plan. An affiliation of a nursing home with a hospital makes possible the development of a smoothly operating mechanism for referral of patients from one facility to another. This two-way movement of patients between facilities helps to assure the chronically ill of services geared to need, and is an essential step in freeing hospital beds

now occupied by long-term patients, who do not require hospitalization.

Another advantage of affiliation is the opportunity which it affords for training all types of personnel giving care to chronically ill persons. If the community has a specialized chronic disease hospital, that institution has the major responsibility for organizing and conducting such a training program.

Under existing circumstances, the determining factor in the placement of patients in "care" facilities is the availability of a bed anywhere. Under an affiliation plan, welfare departments secure admission of public recipients to a hospital, or to its outpatient department. The medical staff of the hospital and the welfare department determine the total medical-social problems of the patient, outline a program based on those needs, then the welfare department recommends the placement of the patient accordingly. Periodically the medical staff of the hospital and welfare case workers reëxamine these persons in order to keep the regimen and placement in line with their changing conditions. Whenever an individual in a nursing home requires diagnostic and specialist services, full use is made of total available community resources. This arrangement makes possible optimal services to the patient at the lowest possible cost. The medical staff of the hospital having affiliation with a nursing home functions in that facility exactly as it does in the hospital situation. Private patients can have these same advantages.

This arrangement is advantageous to the nursing home because (1) it facilitates a two-way flow of patients between the hospital and nursing home; (2) it identifies and integrates such homes with the general medical care program of the community; (3) it provides a means for the training of attendant and nursing personnel of such homes, thus assuring the operators of an adequate supply of competent personnel; and (4) it improves the quality of the preventive, medical, and health services in such homes.

Since nursing homes are medical care facilities, the important consideration is the quality of the medical, preventive, and health services rather than the facility itself.

The majority of licensure laws now in effect do not set minimum standards for medical services in nursing homes. One exception, which merits study, is Ordinance No. 2467 of the City of Fort Worth, Tex.

Experience points to the need for covering all types of medical care facilities by licensure laws. New York State does not have such legislation. In 1946, 8 states had such legislation. In all of them, the health department is the licening agency.[5] Exemption of any "care" facility from the requirements of licensure by the health department is not in the public interest. Legislation governing "care" homes commonly exempts those that are publicly operated. This practice is unsound. The facts do not generally support the implied assumption that public facilities do not need supervision because they are already making an effective and necessary contribution to the total medical care program of the community.

Boarding homes for older persons and homes caring for less than three sick or infirm persons seldom have to meet the requirements of such legislation. Such exclusions from licensure increase the number of illegally operating nursing homes. This observation is true for Nassau County, New York, where the ordinance does not cover (specifically) boarding homes for older persons. There, unless the evidence is that three or more sick or infirm persons are given care for a consideration in a private home, the ordinance does not apply. Medical health officers face practical difficulties in determining whether or not older persons in such homes are infirm. Since

such individuals seldom have pre-admission and periodic medical examinations, the health official can form an opinion only on the basis of what is obvious on inspection. These limitations decrease the likelihood of successful prosecution of those whom the licensing agency charges with violation of the nursing home article of the public health ordinance. In Nassau County today, the number (not the capacity) of known so-called "boarding" homes for older persons and homes offering care to less than three patients exceeds that of licensed nursing homes. There, health officials frequently find that the "boarding" home is, in fact, an unlicensed, second-rate nursing home. Amendment of the Nassau County Public Health Ordinance in accordance with these principles is likely in the near future.

The discussion which follows shows the practical application of these principles of licensure. A person files an application for a license to operate a "care" home. The health department determines both the adaptability of the physical plant to such use and the fitness of the applicant to operate such a facility. After completing an investigation, the health department either denies the application, or issues a "care" home license for a probationary period if, from the evidence at hand, it appears highly probable that both the plant and the operator can, within a year, meet or exceed the minimum standards either of a supervised boarding home for older persons or of a licensed nursing home. A statement accompanies this license. This tells the operator exactly what he must do in accordance with a time schedule, if he is to qualify for a license to operate (1) a supervised boarding home for older persons, or (2) a licensed nursing home. If, at any time during the probationary period, the operator fails to meet the conditions of the license to operate a "care" home, the department gives notice and later revokes that license, and, if necessary, files an information. During the probationary period, the department gives a great deal of educational assistance to the operator. If prior to or at the end of that period, the facility meets the minimum standards either of a supervised boarding home for older persons or of a licensed nursing home, the department issues a license accordingly.

Some things have been done in Nassau County that seem to warrant application elsewhere.

Through conferences with zoning, building, and fire officials, the county department of health has been able to secure a statement of minimum requirements for fire and building safety which every local inspector will enforce. As a result, the department has been able to give written notice to all nursing home operators a full year in advance of the effective date of any new requirements of fire and building authorities.

"Team" inspection has replaced those made independently by fire, building, health and welfare officials in order to impress sufficiently both officials and operators with the fact that these homes are medical care facilities. Inspection by a "team" is also advantageous because all persons responsible in any way for licensure have an opportunity to see the home under the same conditions and all recommendations can be agreed upon and summarized at the time of the inspection.

The purpose of supervision is to improve the quantity and quality of the total services rendered to the consumer. Much of the present-day emphasis in supervision is on safety from fire, sanitation of the environment, and adequate provision for the basic needs for creature comfort. All of them deserve attention. However, the important thing to remember is that the consumer, in such a facility, pays for and is entitled to receive quality attendant and nursing care under medical supervision. Consequently, un-

less supervision is concerned with the quality of medical, preventive, and health services, these facilities will not make an effective and necessary contribution to the total medical care program of a community. If the development of a "what is the use" attitude on the part of many older persons in these homes is to be prevented, supervision must be extended to include provision for a full social life according to the individual's physical and mental strength and capacity. Efforts to "add life to years, not merely years to life" have been amply rewarded according to Wagner [6] and Gorrie.[7]

The application of this philosophy of supervision requires that all the habits and thoughts of many people regarding "between the hospital and home facilities" be changed. Education is, therefore, a fundamental part of supervision. Medical practitioners, operators, and staffs of nursing homes and related facilities, members of the inspectional force responsible for supervision, appropriating and other officials, and the consumer public—all must be moved to assume their respective and collective responsibilities for supervision. The fact that a purposeful and well directed educational approach results in sustained improvements in services and in their extension has been amply demonstrated in connection with many other areas of medical-social service. Education is fundamental to integration of services and to the economic use of facilities.

Administrative problems encountered in connection with the regulation and supervision of nursing homes have resulted from (1) the number of governmental officials involved in licensure; (2) the habits of thought and action of public officials, some of whom are not directly concerned with licensure; (3) the language of the regulation, which frequently makes possible more than one interpretation of its intent; (4) the inability of operators to secure adequate and qualified personnel, especially nurses, and needed materials for structural improvement; (5) the acute shortage of beds in general hospitals and allied medical facilities; (6) the number of older persons suffering from mental changes of non-committable character; (7) the fact that the present provisions of the federal Social Security Act preclude payment of benefits to individuals in public institutions as a reimbursable item and, conversely, that in this state, care in a private nursing home is a reimbursable, medical item.

Administration has been made more effective through other uses of education. An institute on nutrition was offered to nursing home operators. Attendance was excellent. Public health nurses and medical personnel on the staff of the department periodically review medical and other records which are required of nursing home operators.

A consultative and advisory service has been initiated by the department. Such services are available to existing operators, to those who plan to open nursing homes, to public officials, and to the general public. One of the practical values of such services to prospective operators is protection against rental or purchase of a building which either is not zoned properly or cannot be economically converted for use as a nursing home. Those operators who plan to remodel or to extend their facilities are assisted with the practical planning for such changes.

Frequently information is made available to members of the medical profession and the general public regarding availability of beds in nursing homes. This information service has also been utilized by those in governmental agencies, notably welfare officials.

The Nassau County Department of Health requires the reporting of all accidents which happen in nursing homes, irrespective of evident injury therefrom. The department then investigates the

conditions under which these accidents occurred. Such vital data are generally not available in "Accident Facts." They are obviously a necessary basis for the formulation of a program for prevention of accidents in such medical care facilities.

During 1945 the Nassau County Department of Health, public welfare and fire prevention agencies, jointly considered existing nursing home facilities in relation to need, and filed recommendations with the Office of the County Executive. One of the recommendations was that consideration be given (1) to the full utilization of existing community resources, including public facilities, for the care of the sick, infirm, and handicapped older persons; (2) to the development and maintenance of additional public facilities, for example, a county nursing home; and (3) to the admission of paying patrons to such public institutions. County Executive, J. Russel Sprague, has recently announced that Meadowbrook, a county operated general hospital will be enlarged from 250 to 600 beds, and that the plans for expansion of that facility include a 150 bed chronic disease unit. Primarily because the state law does not now permit the state to reimburse local governments for their expenditures for the care of recipients of public assistance in tax supported institutions, no county nursing home or other medical domiciliary care facility is eventuating. This suggests the need for amending the New York State law, so as to encourage communities to provide adequate medical care facilities.

The simultaneous solution of the complex of interrelated problems under the head of "chronic illness," necessarily requires a coöperative program of the people in their own communities.

Since welfare workers have significantly contributed to a changing social order with its aging population; they cannot escape the responsibility for the medical-social problems that have resulted.

Area Supervisors of the State Department of Social Welfare have many opportunities to improve the lot of older persons—wherever they may live. The preventive approach offers the greatest hope of defeating chronic illness. Yet, today, only 12 of the 57 varieties of counties in upstate New York have a full-time department of health and thus provide their citizenry with the community health protection services which develop under such leadership.

Rusk [8] has stated that rehabilitation to the point of self-care, and even to full or limited employment, is possible for many of the chronically ill who have been hospitalized (or given custodial care elsewhere) over long periods.

The New York State Legislative Committee on Problems of the Aged stresses employment as a form of therapy and full utilization of older workers as an essential means of maintaining the present standards of living in this nation.

Social welfare and health workers generally need to review critically their administrative practices in the light of the extent and special character of the needs of older persons.

Improvement and extension of nursing home and related medical care facilities are urgent needs in a nation-wide, integrated approach to the medical-social problems of all older persons.

Licensure of all private and publicly operated "between the hospital and home facilities" by the State Department of Health is administratively practicable and desirable.

Education should keynote the administration of a licensure law. Supervision should be inclusive and cover medical, preventive, health, and social services.

Corrective legislation is indicated. Care in a public medical facility should be a reimbursable item of expense to local governments.

Care in a public institution should be available to all who need it. Payment for such services should be required according to ability to pay. Both privately and publicly operated medical care facilities should provide quality services geared to the needs of older persons.

Evidence is increasing that the public will soon insist that a nursing home be a safe, sanitary, private or public medical care facility, operating under health department licensure and having medical services affiliated with the staff of a secondary hospital center; that the personnel of a nursing home be prepared by training and experience to render, under medical supervision, preventive, medical, health, and social services based on the total needs of sick, infirm, or handicapped persons, not requiring hospitalization; and that the patient in such homes be provided the maximum opportunity for rehabilitation, and, whenever possible, resumption of a happy, economically useful life in his own home.

What Does Public Health Nursing Cost*

MABEL REID

Chairman, Working Committee of the National Organization for Public Health Nursing Cost Study, New York, N. Y.

THERE is a familiar quotation to the effect that public health can be purchased. Research and experience have demonstrated how to achieve a high level of health if a communtiy is willing to spend the necessary money. Tax-conscious citizens want to know "How much does it cost?"

We have been hearing today how to increase the expertness of the public health nurse. If a community is to have expert public health nursing service, and if on-the-job training programs are to be maintained, there must be funds to finance such services and programs. The budget-minded administrator has to think in terms of dollars and cents.

This need to think in terms of cost was felt by visiting nurse associations more than twenty years ago when they entered into contracts with large insurance companies to furnish home nursing service on a fee basis. At that time, the National Organization for Public Health Nursing met an urgent need by developing a standard method for computing the cost of a home nursing visit. This method has been in widespread practice ever since and, as a result, perhaps more than any other branch of the great health and welfare enterprise in this country, visiting nurse associations have been accurately informed concerning the cost of at least one of the services they render.

Official public health nursing agencies have not had the same interest in the cost of a home nursing visit. Since their budgets come largely from tax funds, their concern with respect to cost is likely to center around a service program such as maternity for which funds may be available from state or federal appropriations.

Two years ago, the N.O.P.H.N. undertook to develop a new method for computing costs in public health nursing which would adequately meet current needs, particularly those of the official agencies. Two gifts made the initiation of such a project possible. The U. S. Public Health Service loaned Margaret Arnstein to serve as director of the study for one year and the Metropolitan Life Insurance Company contributed $10,000. Subsequently, additional funds were obtained from the Public Health Service through its division of Research Grants and Fellowships, and other individuals and firms have been generous with time and service.

Miss Arnstein and cost accountants from the Trundle Engineering Company, skilled in analyzing and solving cost problems for all types of business and industrial firms, began by visiting four sample agencies to explore the types of cost problems which might be encountered in public health nursing—a city health department, a county health de-

* Presented before the Public Health Nursing Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

partment, a visiting nurse association, and an organization combining the functions of an official and a voluntary agency. Together, they devised a single method of cost accounting which could be used in all the situations they had observed. In the past year, this method has been tested in nine agencies of varying size with different types of administration. It has undergone certain modifications, and a manual of instructions outlining the method has been written, revised, rewritten, and rearranged, as actual experimentation suggested improvement.

The manual is not yet in its final version but the committee guiding the project is ready to recommend the method, convinced that it is the soundest and best procedure for public health nursing at the present time.

We understand that there is no one right method of cost accounting; but the advantages of a single standard method for public health nursing agencies are obvious if there is to be any comparison of results or if the resulting costs are to be used as a basis for negotiating contracts with a common consumer, such as the large insurance companies have been in the past and as state and federal agencies may become in the future.

We understand too that the nursing division is only a part of a health department, but public health nurses have never been averse to pioneering. Perhaps, if a satisfactory method for computing costs in the nursing division is available, health officers may become so enthusiastic about the possibilities and results that they will see the advantages of extending such a study to cover all divisions in the health department. One such health officer is a member of the working committee guiding the study.

One of the virtues of the recommended procedure is its versatility and flexibility. Whereas agency A wants to know the total cost of its maternity program in order to apply for funds which may be available through state or federal appropriations, agency B is experimenting with different kinds of field experience for students and wishes to know the relative cost of each, while agency C, which combines the functions of a health department and a visiting nurse service, wants to determine how much of its budget should rightly come from tax funds and how much from the community chest. All three can apply the proposed method of cost accounting to obtain the information they seek. It can be used to compute the cost of a service program such as maternity or tuberculosis, the cost of a unit of service such as a clinic session or a home visit, or the cost of a unit of time such as an hour of school nursing or a student day.

The first step is to analyze the reasons for wanting cost information and to list the "cost centers" which will be needed to give the desired results. Cost center is the term used for any program, service, or activity for which costs are to be computed. In setting up cost centers, all of the functions of the agency should be recognized so that one service will not unwittingly be charged with costs that belong to another. Cost centers may be subdivided into as many categories as the agency desires, but it will be necessary to decide at the beginning of a fiscal year what subdivisions are needed in order to plan for a statistical count of service in the same breakdown. For example, if an agency wishes to develop separate costs for different types of visits, it must keep a record of the number of visits of each type made during the year.

Once the cost centers are determined, the problem becomes one of allocating the various expenses incurred during the year. Different kinds of expenses are allocating in different ways. There are (1) the salary cost of actual nursing service rendered, (2) the cost of super-

vising service performed by staff nurses, (3) transportation cost which includes the cost of operating cars owned by the agency, depreciation on these cars, money paid to nurses for the use of their cars, and carfare, (4) direct cost, items of expense peculiar to a single cost center which are kept separate on the agency's books, and (5) overhead expense which includes the cost of administration, clerical service, rent, office expenses, nursing supplies, insurance and all other expenses not already listed.

Direct costs are allocated immediately to the appropriate cost centers. Transportation costs are allocated according to the number of trips incurred in each cost center. All other expenses are allocated according to the number of trips incurred in each cost center. All other expenses are allocated on a time basis according to the number of hours spent in each cost center during the year. Sample time studies are made to determine the length of time required per unit in each cost center, e.g., the time per clinic session, the time per visit, the time per student day, etc. Then using the total number of units recorded during the year and the standard time for each unit, the total annual hours required during the year and the standard time for each unit, the total annual hours required for each cost center are computed.

Time studies need be made only for sample periods long enough and frequent enough to produce representative averages. In most agencies, it is suggested that two studies lasting two weeks each will be adequate. Once the standard time units have been calculated, annual cost studies may be made for the next two or three years without repeating the time study unless there is good reason to believe that the average time per unit has changed. Since the time study is the very heart of the cost procedure, considerable effort is justified to enlist the interest and coöperation of those who participate. It is strongly recommended that the time study used for cost accounting purposes never be used as a supervisory tool. The time records must reflect what actually happens, not what the staff nurse thinks the supervisor would like to see.

Now that the method has been standardized to the committee's satisfaction, the project has entered into a second phase. Elizabeth Stobo, who succeeded Miss Arnstein as nurse director of the study, is conducting a series of three day institutes throughout the country for the purpose of teaching the method to agencies and encouraging them to use it to compute their own costs. She is meeting an enthusiastic response everywhere. State directors of nursing are coöperating with her in selecting suitable locations for the institutes and in suggesting agencies and persons to whom invitations should be extended. In addition to nurse directors, chief clerks, and statisticians who have accepted the invitations, at least one health officer has asked to attend with a view to applying the method to other divisions in the department for which he is responsible.

It is understood that acceptance of an invitation to attend an institute carries with it an obligation to try out the procedure and submit the resulting cost data to the N.O.P.H.N. study committee. A copy of the manual of instructions in its present form and an adequate supply of time study forms and posting sheets are provided for each agency to undertake its own cost analysis.

Although the method is not difficult to understand in theory, the committee is aware that the task of tabulating time study data and of completing the necessary computations involved in allocating expense data to the different cost centers presents practical difficulties not to be minimized in the average agency

without personnel trained for such work.

In the tests which have been made of the method during the past year, it has been demonstrated that mechanical tabulation is preferable to hand posting for summarizing the time study data. In a large agency, where the volume of data is great, it is difficult to maintain accuracy when tabulating by hand. In a small agency, there is often no one to do the job. While posting sheets have been designed in considerable detail for organizations which wish to handle this part of the work themselves, plans are being worked out with International Business Machines so that agencies may send their time study worksheets to a central tabulating bureau to be punched on cards and summarized mechanically. Eventually, such facilities may be available through local and regional I.B.M. offices but, while the study is still in progress, it will be handled by the New York office through the N.O.P.H.N. so that the study staff can keep in close touch with the types of problems which will arise and see that they are handled consistently.

So much for the tabulation of time study data. As for the computations involved in the allocation of expense data to the various cost centers, it is expected that, while the study is in progress, members of the staff under Miss Stobo's direction will be able to take over this part of the work at a price which will be attractive to individual agencies.

Thus relieved of laborious, time-consuming computations, each agency may concentrate on a thoughtful plan for cost centers to meet its specific needs and a painstaking and accurate record of how individuals spend their time during a brief sample period.

Early in 1949 a statistician will be added to the study staff as the project enters a third and final stage. Material submitted by agencies which have attended the institutes and studied their own costs will be analyzed with two objectives in mind: (1) to see whether the proposed method is as practical and as valid as the committee believes it to be, and (2) to determine what public health nursing service under different types of administration in different parts of the country does cost. This final phase of the project is expected to be completed by the end of the year 1949.

If you are a public health nursing administrator faced with the task of preparing a budget and securing funds to carry out the kind of program you know is desirable, here is a tool you have been seeking. You can answer that question of tax-conscious citizens, "How much does public health nursing cost?"

Comparative Analysis of the Standard Methods Methylene Blue Stain and Advantages of the Polychrome and Acid-and-Water-Free Stains in the Direct Microscopic Examination of Milk

BENJAMIN S. LEVINE, PH.D., F.A.P.H.A., AND LUTHER A. BLACK, F.A.P.H.A.

Senior Bacteriologist and Principal Bacteriologist, Milk and Food Sanitation Laboratory, Environmental Health Center, Federal Security Agency, Public Health Service, Cincinnati, Ohio

IN this report a critical analysis of the Standard Methods' recommendations for staining milk films and the results of a comparative study of direct microscopic counts made on 75 milk specimens is presented. These specimens were collected during the week of March 9–14, 1948, from a Northern Illinois milk shed. The health department of the city receiving this supply of milk exercises strict laboratory control. For purposes of identification and differentiation in this and other reports, we refer to such a milk supply as a "graded" supply, and to others less strictly controlled, as "inspected" supplies.

PROCEDURE

Milk samples were collected early in the morning at the milk plants from cans, as they were delivered to the plants by the individual producers. No duplicate collections were made. The requirements in the Eighth and Ninth Editions of *Standard Methods for the Examination of Dairy Products* for the collection and delivery to the laboratory of milk samples,[1] were strictly followed. Four sets of 1 cm. sq. films were prepared as described in a previous paper.[2] Most of the staining procedures commonly used in the direct microscopic technic for determining the bacterial counts of milk were previously studied by us and a report of the results has been presented in another paper.[3] One set was stained by the carbolated methylene blue procedure, another set by the polychrome stain, and the remaining two sets by the acid-and-water-free stain, as described later in this report. This study was therefore limited, first, to an analysis of the stipulations set forth in the Eighth and Ninth Editions of Standard Methods for staining milk films, and second, to a comparison of the results obtained by two newly proposed staining procedures, with the results of the standard carbolated methylene blue slides which were, as recommended in Standard Methods, partially destained in alcohol prior to counting. One of the new stains developed in our laboratory and described in a previous paper[2] was designated by us as the acid-and-water-free stain, because it is free from *added* acid or water. The

other stain, a variety of the polychrome methylene blue, was described in a mimeographed sheet of instructions issued by the Rockford (Illinois) Health Department Laboratory, March 11, 1948.[4] The defatting agent and the polychrome dye solution used in this study were supplied to us by the authors of that staining procedure.

The process of staining was carried out in each instance as prescribed by Standard Methods or by the authors of the new procedure. The microscope was standardized to a factor of 300,000. The number of fields counted was never less than that required in Standard Methods and in many instances exceeded it.

STAINING SOLUTIONS AND PROCEDURES RECOMMENDED

In the Ninth Edition of Standard Methods under the item "Preparing Stains," the following is recommended: "To maintain sterile staining solutions, use carbolated methylene blue, prepared by adding 10 ml. of a saturated aqueous methylene blue solution to 90 ml. of a 2.5 per cent phenol solution. When assured of freedom from objectionable contaminants, optionally use a stain prepared by dissolving 0.3 gm. of certified methylene blue powder in 30 ml. of 95 per cent ethyl alcohol or suitable denatured alcohol, and then add to the alcoholic solution 100 ml. of distilled water." Since the use of the above described stains is optional, it is conceivable that where a batch of milk films may be divided between two workers, one may use the stain prepared by adding the 10 ml. of saturated aqueous to 90 ml. of carbolated water, while the other, due to personal preference, may use the optional staining solution. The films would then be counted and the results regarded as if obtained by one and the same standard procedure.

An analysis of the two staining solutions shows that such a technical procedure may not produce standard results. In the first place, since 10 ml. of an aqueous saturated solution of the dye contains 0.355 gm. of the dye,[5] and the solution is made up to 100 ml., the percentage of the dye content in this solution will be 0.355. In the second solution, where 0.3 gm. of the dye in 30 ml. of alcohol are added to 100 ml. of distilled water, thus making a final volume of 130 ml., the percentage of the dye will be only 0.23 per cent, or 36 per cent less than the dye concentration in the first staining solution.

In the first staining solution water alone is used as the solvent of the dye. Water has a surface tension of 72.23 dynes per sq. cm. under standard conditions of testing. In our experiments the addition of 2.5 per cent of phenol lowers this tension to 46.0 dynes per sq. cm.* In the second staining solution the solvent of the dye consists of 100 ml. of distilled water and 30 ml. of alcohol. Its surface tension was found to be 41.0 dynes per sq. cm. The pH of the solvent of the first staining solution was 5.4 and that of the second 4.4. The errors introduced into the pH values by the addition of alcohol, when plotted, follow a type of hyperbolic curve, and between the concentrations of 95 per cent and 25 per cent of alcohol have the limiting values of 0.025 and 0.001. We believe, therefore, that in determining the pH of the solvent which contains alcohol, we can use the readings without making any corrections. After the dye is added, the pH values of the two staining solutions under discussion become practically identical, as is shown in Table 1.

Table 1 shows that the two factors having the greater differences in values are the dye concentration, which, in the alcohol-containing solutions is 36 per cent less than in the carbolated staining solution, and the surface tension, which is 11 per cent higher in the carbolated

* Acknowledgment is made to Sanitarian (R) Francis I. Norris for surface tension measurements.

Alcohol Containing	41 0	4.4	41.0	3.7	0.230%

* In dynes per sq. cm.

solution than in the alcohol-containing solution. Our concept of the process of staining milk films with methylene blue hydrochloride is basically that of adsorption. This was discussed by us in another paper.[2] The final values in isothermic equations which express the equilibrium attained by any system of adsorption are largely controlled by the concentration of the solute, or the adsorbent, and by the surface tension of the solvent.[7, 8] There are, of course, other factors of influence, but for purposes of our present study only the two mentioned factors are considered. Adsorption is a very sensitive reaction and is highly responsive to changes in the magnitude of the major factors which influence it. This is especially true of the two factors mentioned which show considerable difference in Table 1. It would seem, therefore, that, unless a comparative study justifies the retention of the two staining solutions as equally standard, only one should be designated as such. On the basis of theoretical considerations, and some of our preliminary results, the alcohol-containing formula should perhaps be given preference.

EFFECT OF DECOLORIZING MILK FILMS STAINED BY THE CARBOLATED METHYLENE BLUE PROCEDURE

The recommendations for the actual staining of milk films are specified in the Ninth Edition of the Standard Methods, as follows: "Dip slides in staining solution *just long enough* (usually 10–15 sec.) to provide a contrasting background for the more deeply stained bacteria, but avoid overstaining. Rinse slides carefully in water and, if overstained, partially decolorize in alcohol." Such a specification can hardly be fitted into the concept of one supposed to be standard.

In the first place, the expression "*just* long enough" and "usually 10–15 sec." are worded in such nonspecific terms as to mean anything from 5 seconds to 30 seconds to different workers, since it is not readily feasible to determine whether or not a proper contrast has been attained before the slides have been examined under the microscope. In the second place, the expression "to provide a contrasting background for the more deeply stained bacteria" seems to presuppose that all bacteria found in all milks stain more deeply than the proteins of the milk. This, as we know now, is an erroneous supposition. Many bacteria stain to barely the same intensity with the background. They can be discerned and counted only by experienced workers, by recognizing their peripheral outlines. If the staining process is so carried out as to attain strong contrasts, such lightly staining bacteria will be completely lost from view. This is what was meant by the statement in one of our previous reports that "strong contrasts are attained at the expense of delicacy in color shades, which in turn results in the loss of visibility of numerous bacteria whose affinity for the dye is only slightly greater than that of the milk proteins forming the background of the smear."[3] And finally, since the in-

TABLE 2

Comparison of Microscopic Clump Counts of 75 Raw Milks Stained by Carbolated Methylene Blue

	Total Group Count	*Average Count*	*Highest Count*	*Lowest Count*
Before destaining	9,362,000	125,000	2,700,000	6,000
After destaining	11,750,000	157,000	2,400,000	30,000

tensity with which the contrasting background may be stained will vary with the preference of different workers, the number of bacteria missed in counting films made of the same milks may vary widely. Concomitant with this, the recommendation that overstained slides be partially decolorized in alcohol, will lead to additional wide variations in counts, since different workers, as well as the same workers at different times, may regard seemingly satisfactorily stained slides as overstained, and vice versa.

To determine the effect of partial decolorization in alcohol of milk films stained by the carbolated methylene blue procedure, the following experimental test series was carried out. A set of 75 milk films of the specimens collected were stained by the aqueous carbolated stain for as nearly 15 seconds as laboratory procedures of this kind permit. The films were counted and the results recorded. The stained slides were then decolorized by immersing them in 95 per cent ethanol for 15 to 20 seconds, and again counted. Comparison of results on a basis convenient for tabulation is presented in the next 4 tables.

If the effect of destaining on the bacterial counts of the groups of the 75 milk specimens is expressed in general terms of highest, lowest, and mean averages, it leaves the impression that the difference is very slight, as can be seen from Table 2.

However, when the data are analyzed in greater detail, as is done in Tables 3,

TABLE 3

Increase in Clump Counts of 32 Raw Milks Stained by Carbolated Methylene Blue

Specimen Number	*Count before Destaining*	*Counts after Destaining*	*Absolute Increase*	*Per cent Increase*
1	6,000	60,000	54,000	900

65	24,000	40,000	16,000	67
71	78,000	110,000	32,000	40
74	36,000	50,000	14,000	39

4, and 5, the difference in the counts obtained from the original and destained milk film appears to be of significance. Not only does the difference appear to be of importance from the viewpoint of general statistics, but it affects the number of milk specimens which might fall into Grade A.

In preparing Table 3, only those milk specimens in which the actual increase in bacterial counts, after partial destaining, was over 35 per cent of the original, were included. Even then, as may be seen from the table, in 32 specimens out of 75, or 43 per cent, the counts increased variably from 39 per cent to 900 per cent over the counts made prior to destaining. In 18 instances the counts after destaining were lower than the originals. In 9 of these, or 12 per cent (not tabulated), the actual decrease in counts was 10,000 or less. Such a differance was regarded by us as well within the experimental error. The remaining 9 counts, or 12 per cent, are listed in Table 4.

greater part of the bacteria will yield the adsorbed dye to the alcohol to a degree exceeding that of the milk proteins (and we know from experimental evidence that this oftentimes occurs), the number of bacteria visible under the microscope will become reduced after destaining. However, the frequency with which destaining of carbolated methylene blue stained milk films effects an increase in the bacterial counts, exceeds by far the frequency with which it effects a decrease in the counts. This is clearly shown by comparing the data presented in Tables 2 and 3. In Table 2, 32 specimens are listed, or 43 per cent of the entire set studied; the per cent of count increase varied from 35 as the lowest to 900 as the highest, with an average of 155 per cent. In Table 3, 9 specimens are listed, or 12 per cent of the entire group; the per cent of count decrease varied from 17 as the lowest to 46 as the highest, with an average of 34 per cent.

The effect which partial destaining of

TABLE 4

Decrease in Clump Counts of 9 Milks Stained by Carbolated Methylene Blue

Specimen Number	*Counts before Destaining*	*Counts after Destaining*	*Absolute Decrease*	*Per cent Decrease*
4	78,000	50,000	28,000	36
8	120,000	70,000	50,000	40
23	190,000	130,000	60,000	33
45	230,000	100,000	130,000	46
52	84,000	50,000	34,000	40
56	120,000	100,000	20,000	17
63	140,000	100,000	40,000	38
69	72,000	60,000	12,000	17
70	144,000	90,000	54,000	37

It is believed that the increase and decrease in bacterial counts, after milk films stained with carbolated methylene blue are partially destained in alcohol, are due to related factors. In instances where the milk proteins give up the excess dye to the alcohol to a degree greater than the larger part of the bacteria, the background will be lightened and more bacteria will become visible under the microscope. On the other hand, in those milk films where the

carbolated methylene blue stained milk films may have upon grade placement of the milks tested is brought out in Table 5. In this table are listed milk specimens the bacterial counts of which exceeded 200,000 in either the "undestained" or the destained, or in both types of milk films.

The data presented in Table 5 show that according to the "undestained" counts only 6 of the milks had counts exceeding 200,000, whereas by the

* Counts exceeding 200,000 are followed by asterisks.

counts of the destained slides 10 specimens had such counts. This represents an increase of 67 per cent. The reverse situation occurred in only one specimen, No. 45. If a similar comparison is made on the basis of the 400,000 count limit suggested[9] for milks held over before pasteurization, only 2 milk samples by the "undestained" (Nos. 19 and 62) and 3 samples by the destained procedures (Nos. 16, 19, and 62) would fall below grade A. While such numbers are inadequate for percentage interpretation, here also the destained procedure screened out a greater number of milks than did the "undestained" procedure.

In appraising the significance of the data just discussed, it must be emphasized that the counts were made on milks obtained from a "graded" supply, where generally the bacterial counts tend to stay considerably below the border lines. It is reasonable to suppose that if a similar survey were made in a milk shed constituting an "inspected" supply, where the sanitary control is not so strict, instances in which counts by the undestained procedure come close to the border line of 200,000 might be more numerous.

We have previously shown that the differences in the surface tension, the pH, and the dye concentration of the two staining solutions recommended as optional in the Ninth Edition of the Standard Methods are considerable. In the immediately preceding paragraphs we have shown that the differences in bacterial counts and their effect upon the grade placement of the milks in "undestained" and destained milk films are also of a significant magnitude. Therefore, the question arises whether the options permitted by Standard Methods are in accord with the concept and purpose of standard procedures. In our opinion, the concept and purpose of standard procedures precludes any alternatives or options, unless it can be proved to the satisfaction of those most concerned that the differences between the results secured by the alternative or optional procedures and those of the basic standard procedure, lie within the limits of experimental error.

COMPARISON OF BACTERIAL COUNTS OF MILKS STAINED BY THE CARBOLATED, THE POLYCHROME AND THE ACID-AND-WATER-FREE METHYLENE BLUE STAINS

An analysis of the data presented in the preceding section of this report appears to indicate that proper decolorization of a series of milk films stained by the carbolated methylene blue procedure results in a greater number of maximal counts, and concordantly in a greater number of counts which exceed the 200,000 limit of grade A milk. For this reason we have used counts obtained on the set of decolorized slides as our basis for comparison in the following study. As stated previously, these slides were prepared and stained on the days the milk samples had been brought into the laboratory. The staining with the poly-

TABLE 6

Comparison of Microscopic Clump Counts of 75 Raw Milks Stained with Methylene Blue

	Total Group Count	*Average Count*	*Highest Count*	*Lowest Count*
Carbolated Destained	11,750,000	160,000	2,400,000	30,000
Polychrome	9,000,000	120,000	1,800,000	6,000
Acid-and-Water-Free	15,900,000	210,000	3,600,000	50,000

chrome methylene blue was carried out following the instructions of Anderson, Moehring, and Gunderson,[10] using the defatting-fixing agent and the polychrome stain supplied by them. The staining of these slides was accomplished seven days after the milk films had been prepared and kept in dry condition. The acid-and-water-free stain was applied by us as outlined in a previous paper [2] using the two-dip procedure. This set of dried milk films were 14 days old when they were thus stained.

As shown in Table 6, the overall survey indicates that the highest counts were obtained from the milk films stained by the Acid-and-Water-Free procedure. This was followed by the Carbolated Methylene Blue, destained. The counts obtained by the polychrome methylene blue staining procedure appear to be the lowest. Comparing the data obtained for this polychrome stain with corresponding data for the carbolated methylene blue not destained, as shown in Table 1, it appears that the results of these two stains were similar. In a previous study,[2] where a different batch of the polychrome stain, also supplied by the originators was used, we reported considerably higher results for the polychrome stain. This might indicate that different batches of this stain may not be uniform and thus tend to yield varying results.

In Table 7 are presented results of bacterial counts which exceeded 200,000 by one or any combination of the staining procedures compared.

An analysis of Table 7 shows that of the 75 milk specimens studied, 10 specimens, or 13 per cent, gave bacterial counts exceeding 200,000 by the partially destained carbolated methylene blue stain; 9, or 12 per cent, by the polychrome stain; and 17, or 22 per cent, by the acid-and-water-free stain. In only two specimens (Nos. 16 and 20)

* Counts exceeding 200,000 are marked with asterisks.

did the carbolated methylene blue yield counts over 200,000, and the other two stains produce counts below that number. The acid-and-water-free stain yielded 7 such cases, while in the films stained by the polychrome methylene blue, there were none. This analysis verifies the impression gained from a study of Table 6, namely, that the polychrome staining solutions used produced counts not exceeding those obtained from counting "undestained" carbolated methylene blue films. The fact remains, however, that with another batch of this type of stain we were able to obtain counts considerably higher than with the destained carbolated methylene blue.[2] With either of the batches used no overstaining has occurred and the slides could be read with much greater ease than those stained with carbolated methylene blue. From this it appears that the polychrome stain has favorable possibilities, which improvement in the process of its preparation may bring out.

FOURTEEN AND NINETY DAY OLD FILMS STAINED BY THE ACID-AND-WATER-FREE PROCEDURE

There are reasons for which even a most carefully planned study cannot always be carried out as originally designed. Thus, as previously stated, only the carbolated methylene blue stain was applied to the milk films of the series here reported on the days the milk specimens were brought into the laboratory. The polychrome stain was applied 7 days, and the acid-and-water-free stain 14 days later. The sets of dried milk films held over were kept in slide boxes and in a dry atmosphere. It was assumed that in such a state the original staining properties of the slides would remain unaffected. However, in order to ascertain the correctness of our assumption, the first 50 slides of the remaining unstained set of the series of milks here studied were stained by the acid-and-water-free procedure 90 days after the last collection day. They are compared with the 14 day old slides in Table 8.

Even a cursory glance over the data presented in Table 8 indicates that their values are practically similar and that any difference between them lies well within the range of experimental error. An analysis of the data verifies this. Thus, the total of the counts made on the 14 day old films is 9,300,000, the average of the counts is 190,000, the highest 710,000 and the lowest 42,000. The total of the counts made on the 90 day old films was 10,400,000, the average 200,000, the highest 1,100,000 and the lowest 50,000. The number of milk specimens which exceeded the 200,000 count was 15 in the 14 day old set and 16 in the 90 day old set. It was noted, however, that specimen 29 gave a count of 210,000 on the 14 day old film and only 160,000 on the 90 day old film. Conversely, specimen 43 gave a count of 220,000 on the 90 day old film and only 200,000 on the 14 day old film. These differences lie within the range of experimental error. Similar comparative observations were made by us on limited sets of milk slides varying in age from 2 to 14 days, stained by the polychrome and acid-and-water-free stains.

It would seem from the study of Table 8 that from the viewpoint of individual counts, and consequently from the viewpoint of effect upon grade placement, dried milk films stored under satisfactory conditions may be stained and examined as long as 90 days after preparation, and possibly longer, and still yield reliable results. This is of importance when a survey of milk film counts by the same or different stains in a selected number of widely distributed milk laboratories is considered. In the light of these results, it would appear both practical and safe to have a number of sets of milk films prepared in a designated laboratory for distribution for survey purposes, by following a procedure similar to the one adopted

TABLE 8

Comparison of Clump Counts of Milk Films 14 and 90 Days Old, Using the Acid-and-Water-Free Stain

by the committee on the standardization of serologic procedures and laboratories.

SUMMARY AND CONCLUSIONS

Direct microscopic counts were made on 75 milks collected from a "graded" milk shed in Northern Illinois in March, 1948. The counts were made after milk films were stained in sets by the carbolated methylene blue, "undestained" and destained, the Anderson, Moehring, and Gunderson polychrome methylene blue, and the acid-and-water-free stain as developed in this laboratory. The carbolated methylene blue stain was applied to the milk films on the days the milk samples were brought into the laboratory and counted. The stained films were then partially destained in alcohol and again counted. The polychrome methylene blue and the acid-and-water-free stains were applied to two other sets of milk films 7 and 14 days respectively after their preparation. Another set of the first 50 milk films was held over for 90 days and then stained by the acid-and-water-free stain. All counts were studied in several combinations for comparative analyses, as shown in 7 tables and discussions indicated in the body of this report. The pertinent points of the study can be expressed in the following conclusions:

1. The surface tension, and the dye concentration of the two staining solutions recommended on an optional basis in the Ninth Edition of the Standard Methods differ. Reasons are indicated why such an optional recommendation may be regarded as contrary to the concept of standard procedure.

2. Counts of milk films stained by carbolated methylene blue were shown to differ considerably upon reëxamination after partially destaining them in alcohol, as suggested in Standard Methods. The differences were sufficiently great to be of significance not only from a general statistical viewpoint, but also significantly affected the number of specimens in their relation to Grade Placement.

3. The batch of polychrome methylene blue stain used in this study gave counts lower than either of the other two stains with which it was compared. However, the stain produced slides comfortably read under the microscope. With another batch of this stain previously used, significantly higher results had been ob-

tained. Therefore, it appears that the stain has favorable possibilities and merits further study, including attention to standardization of the procedure for the preparation of the dye and its final solution.

4. The acid-and-water-free stain gave the highest number of maximal counts for the series as a whole. The percentage of counts exceeding 200,000 was 22, as compared with 13 and 12 for the other two stains.

5. Bacterial counts of dried milk films stored under satisfactory conditions for as long as 90 days prior to staining with the acid-and-water-free stain were similar to those of preparations stored only 14 days.

6. It would appear that for the purpose of surveys of staining procedures by different milk laboratories, a number of sets of milk films could be prepared in a designated laboratory and distributed with pertinent instructions to widely scattered laboratories for staining and counting. The counts could then be collected by the central laboratory for statistical study and appraisal of results.

Health Congresses to Be Held in Argentina

The Government of Argentina and the Pan American Sanitary Bureau have announced their sponsorship of the First Inter-American Regional Congress and Second National Congress of Hygiene and Social Medicine to be held in Santa Fe, Argentina, October 21–25, 1949.

In sponsoring this congress, the Pan American Sanitary Bureau is acting in the spirit of the resolutions adopted by the XII Pan American Sanitary Conference, which set as the Bureau's principal objective the promotion of hygiene and public health in the entire Western Hemisphere, through the coördinated efforts of all the countries of the Hemisphere.

Since only a short time is available for making suitable preparations for a Pan American Congress on Hygiene, it was considered desirable to invite only the countries in the southern and eastern regions of South America (Bolivia, Brazil, Chile, Paraguay, Peru, and Uruguay), although invitations will be sent to other distinguished persons in the fields of public health and social medicine in the remaining countries.

Inactivation of Partially Purified Poliomyelitis Virus in Water by Chlorination

III. Experiments With Natural Waters

SERGE G. LENSEN, PH.D., MORRIS RHIAN, M.S., MAX R. STEBBINS, M.S., ROBERT C. BACKUS, M.S. * AND CARL E. PETERSON, B.S. †

Bureau of Laboratories, Michigan Department of Health, Lansing, Mich.

THE authors reported in previous publications [1, 2] the results of their investigation on the inactivation by chlorination of partially purified poliomyelitis virus (mouse-adapted Lansing strain) in distilled water. It was found that at a pH range from 6.85 to 7.4, the virus was inactivated within 10 minutes in all water samples with residuals consisting of free chlorine and chloramine. This result was obtained even with as little as 0.05 p.p.m. free chlorine. At a higher pH range (pH 8.95–9.25) the antiviral action of chlorine was decreased. On the other hand, in water samples with residuals consisting only of chloramine (no free chlorine) the virus was usually inactivated in less than 2 hours by 0.5–0.75 p.p.m. residual chloramine, while residual chloramine values of 0.2 p.p.m. or less failed to inactivate the virus.

The present paper is a report on further experiments along the same lines in which representative samples of different natural waters were used instead of distilled water.

MATERIAL AND TECHNIQUES

Water—In order to have a fairly wide variety of natural waters, three different lake waters, two river waters and one well water were used in our experiments. Samples of lake waters were taken from Lake St. Clair (Detroit, Mich.), Lake Michigan, and Baw Beese Lake, a small inland lake in Hillsdale, Mich. The river water samples were taken from Flint River, Flint, Mich., and from River Rouge, Rockford, Mich. In addition to these untreated waters lime-treated well water from the Lansing Water Conditioning Plant was used in order to investigate the effect of chlorination at a high pH.

In contrast to our previous experiments, in which the distilled water was sterilized by boiling, the natural waters were not sterilized. Instead, each sample of natural water was tested for safety by intracerebral inoculation into a few mice prior to the chlorination experiments. In addition, the water samples were examined bacteriologically, with results summarized in Table 1.

Virus—Mouse-adapted Lansing strain of poliomyelitis virus was used. Essentially the same virus purification procedure as that described in our previous publications was used,[1, 2] except that the sedimentation of the virus was carried out at 40,000 r.p.m. (approximately 117,000 g.) for 2 hours instead of 3 hours. Virus preparations purified

by one and two cycles of centrifugation contained, in the equivalent of a 10 per cent suspension, an average of 0.049 mg. N/ml. and 0.017 mg. N/ml., respectively.

Chlorination—As in our earlier work, 100 ml. portions of water were used, to which partially purified virus suspensions were added to make a 0.25 per cent or a 0.5 per cent dilution of virus. Chlorination was done by adding chlorine water. The samples were tested for virus content by intracerebral inoculation into white Swiss mice after contact periods of 10, 30, and 60 minutes. Simultaneously with mouse inoculations, residual free chlorine and chloramine were determined by means of the orthotolidine-arsenite test.[3, 4] Since, in some instances, active virus was not detectable after 10 minutes' contact, in spite of the absence of free chlorine (experiments of November 8 and 27 and December 5 and 12, 1946, Table 2), the test for free chlorine was carried out after 5, 10, 30, and 60 minutes in most of the subsequent experiments.

In order to stop the action of chlorine at the end of the contact period, 1–2 drops of a 10 per cent suspension of CNS tissue of normal mice were added to 2 ml. of sample just before injection.

Groups of 20 mice were used for each contact period. The following controls were included in each experiment: 20 mice were inoculated with a suspension of virus in the water used for the experiment, and 20 mice received the same amount of virus in buffered saline. All virus preparations were titrated in mice on the basis of 10 twofold dilutions in buffered saline, and the LD_{50} calculated by the method of Reed and Muench.[5]

EXPERIMENTAL

A. *Experiments with lake waters*

1. *Water from Lake St. Clair, Detroit, Mich.*

The temperature of the water samples used for the different chlorination experiments varied between 19.0°C. and 25.3°C. The pH of the water ranged between 7.90 and 8.14 before addition of virus and chlorine, and between 7.42 and 7.93 after addition of virus and chlorine.

As can be seen from Table 2, there was complete or almost complete inactivation of the virus in less than 10 minutes in all the samples having a residual of slightly less than 0.05 p.p.m. or more free chlorine after a contact period of 5 minutes. There was no difference in this respect in the outcome of the experiment between the water samples containing 0.25 per cent and those containing 0.5 per cent of virus. The corresponding residual free chlorine values after a 10 minute contact varied between traces and slightly less than 0.05 p.p.m.

The results of the experiments with samples containing only traces of residual free chlorine presented some variations. For example, in a water sample containing 0.5 per cent virus and traces of residual free chlorine after contact periods of 5 minutes and 10 minutes (experiment of February 27, 1947), there was complete inactivation of the virus

† Cycles of purification by fractional centrifugation

Plus sign (+) after a figure = slightly more than
Minus sign (—) after a figure = slightly less than

in less than 10 minutes, while in another sample with similar values of residual free chlorine and only 0.25 per cent virus (experiment of January 22, 1947), there was only partial inactivation of the virus even after a contact period of 1 hour. In other experiments with only traces of residual free chlorine after a contact of 5 minutes, there was either partial or no inactivation of the virus.

The residual chloramine values in these experiments were so low (0.05–0.15 p.p.m. in samples with 0.25 per cent virus and 0.2–0.3 p.p.m. in those with 0.5 per cent virus) that, on the basis of our previous work, they could not be expected to inactivate the virus.

2. *Water from Lake Michigan*

The temperature of the water samples varied between 19.0°C. and 22.0°C. The pH of the water ranged between 8.1 and 8.3 before addition of virus and chlorine, and between 7.60 and 7.85 after addition.

Table 3 shows that, in the samples containing 0.25 per cent virus, the virus was inactivated in less than 10 minutes in all the samples having 0.05 p.p.m. or more residual free chlorine after 5 minute contact. In most of these samples there was no residual free chlorine after a 10 minute contact. In one sample with traces of residual free chlorine after 5 minutes and with none after 10 minutes, there was only partial inactivation after 10 and 30 minutes, but almost complete inactivation after 1 hour (experiment of November 6, 1947).

In the experiments with 0.5 per cent virus, there was no inactivation of the virus even after 1 hour, in one sample with traces, and in another with slightly less than 0.05 p.p.m. residual free chlorine after 5 minutes contact. There was no residual free chlorine in either sample after 10 minutes (experiment of November 25, 1947). On the other hand, in the experiment of January 8, 1948, residual free chlorine values of 0.05 p.p.m. after 5 minutes and traces after 10 minutes, were sufficient for complete inactivation of the virus in less than 10 minutes. Amounts of residual chloramine were slightly higher with this water: 0.15–0.3 p.p.m. in samples with 0.25 per cent virus and 0.3–0.4 p.p.m. in those with 0.5 per cent.

3. *Water from Baw Beese Lake, Hillsdale, Mich.*

The temperature of the samples ranged from 19.0°C. to 23.0°C. The pH after addition of virus and chlorination varied from 7.82 to 8.25.

As shown in Table 4, 0.25 per cent virus was inactivated in less than 10 minutes in a sample with 0.05 p.p.m. residual free chlorine after 5 minutes contact and none after 10 minutes. In another sample, with traces of residual free chlorine after 5 minutes contact and with none after 10 minutes, there was no inactivation of the virus after 10 minutes and only partial inactivation after 1 hour.

In experiments with 0.5 per cent virus, the virus was inactivated in less than 10 minutes in samples with 0.05–0.1 p.p.m. and 0.1–0.15 p.p.m. residual free chlorine after 5 minutes contact, and with traces after a 10 minute contact.

The amounts of residual chloramine in these experiments varied between 0.5 and 1.0 p.p.m. and were higher than in the experiments with water samples from Lake St. Clair and Lake Michigan.

B. *Experiments with river waters*

1. *Water from Flint River*

The temperature of the water samples ranged between 23.0°C. and 25.0°C., the pH between 8.12 and 8.23 before and between 7.90 and 8.21 after addition of virus and chlorination. Only experiments with 0.25 per cent virus were carried out.

As shown in Table 5, there was complete or almost complete inactivation of the virus within 10 minutes after chlorination in the samples with a residual of 0.05 p.p.m. or more free chlorine

after a 5 minute contact period. The 10 minute readings ranged in these samples from traces to 0.05 p.p.m. residual free chlorine and from slightly more than 1.0 p.p.m. to slightly less than 1.4 p.p.m. residual chloramine.

The results with samples containing only traces of residual free chlorine after 5 minutes contact, were not consistent. For example, in a sample with traces of residual free chlorine after 5 and after 10 minutes contact (with 1.0 p.p.m. chloramine after 10 minutes contact), the virus was completely inactivated in less than 10 minutes (experiment of March 20, 1947). There was definite, but only partial inactivation of the virus after contact periods of 10 and 30 minutes in 2 other samples with traces of residual free chlorine after 5 and after 10 minutes contact (with slightly over 1.0 p.p.m. chloramine) in the experiments of April 3, and of April 18, 1947. In 2 other samples (experiments of April 3 and April 23, 1947) there was very little or no inactivation of the virus under similar conditions.

2. *Water from River Rouge, Rockford, Mich.*

The temperature of the water samples ranged from 20.0°C. to 21.0°C., the pH (after addition of virus, and chlorination) from 7.82 to 8.05.

Experiments with 4 samples containing 0.25 per cent and with 2 samples containing 0.5 per cent virus were carried out. As can be seen from Table 6, the results were particularly favorable in this series of experiments. There was either complete or almost complete inactivation of the virus in all the samples tested. There was no detectable virus after 10 minutes contact, even in a sample in which there was no residual free chlorine after 5 minutes, while 100 per cent of the control mice developed paralysis (experiment of December 30, 1947). There was only 0.3 p.p.m. residual chloramine after 10 minutes contact.

C. *Lime-treated well water from the Lansing Water Conditioning Plant, Lansing, Mich.*

As already pointed out, this lime-treated water was included in our experiments in order to investigate the effect of chlorination at a high pH range.

The temperature of the water samples in this series of experments ranged between 21.0°C. and 26.0°C. The pH range of the water before addition of virus and chlorine was from 10.0 to 11.25. After virus was added and chlorine applied, the pH ranged between 8.0 and 10.5.

As could be anticipated, the results obtained in this series of experiments were not as favorable as those reported in the foregoing sections.

a. *Experiments with 0.25 per cent virus.*

The data presented in Table 7 show that, in the experiment of March 18, 1948, there was no inactivation of the virus even after 1 hour in a sample with traces of residual free chlorine after a 5 minute contact and no residual free chlorine after 10 minutes contact, and only partial inactivaton in another sample with 0.05–0.1 p.p.m. residual free chlorine after 5 minutes and traces of free chlorine after 10 minutes contact. There was only partial inactivation of the virus after 30 minutes and complete inactivation after 1 hour in a sample with 0.05–0.1 p.p.m. residual free chlorine after 5 minutes contact and 0.05 p.p.m. after 10 minutes contact (experiment of April 8, 1948), and in another sample with slightly more than 0.1 p.p.m. residual chlorine after 5 minutes and slightly more than 0.05 p.p.m. after 10 minutes contact (experiment of April 22, 1948). The virus was almost completely inactivated within 10 minutes, and completely within 30 minutes in a sample with a residual of slightly more than 0.15 p.p.m. after 5 minutes and slightly more than 0.1 p.p.m. after 10 minutes contact (experi-

ment of April 22, 1948). Complete inactivation of the virus within 10 minutes was achieved with the following residual free chlorine values: Slightly more than 0.1 p.p.m. after 5 minutes contact and 0.1 p.p.m. after 10 minutes; slightly less than 0.2 p.p.m. after 5 minutes and 0.10–0.15 p.p.m. after 10 minutes contact (experiment of April 1, 1948); slightly less than 0.15 p.p.m. after 5 minutes and slightly more than 0.1 p.p.m. after 10 minutes (experiment of April 8, 1948). The residual chloramine amounts in all these experiments ranged between 0.75 and 1.0 p.p.m.

b. *Experiments with 0.5 per cent virus*

As shown in Table 7, in 2 of the water samples with residual free chlorine amounts of 0.3 p.p.m. after 5 minutes and 0.10–0.15 p.p.m. after 10 minutes in one case and slightly more than 0.15 p.p.m. after 5 minutes and 0.10–0.15 p.p.m. after 10 minutes in the other, there was no detectable virus after 30 minutes in either sample, and only very little after 10 minutes contact. In the 2 other samples, with residual free chlorine amounts of 0.15 p.p.m. and slightly more than 0.1 p.p.m. after 5 minutes, respectively, and slightly more than 0.05 p.p.m. after 10 minutes, complete or almost complete inactivation was achieved within 1 hour. The residual chloramine values in these experiments ranged between 0.75 p.p.m. and 1.25 p.p.m.

It seems worth mentioning that the alkalinity of these lime-treated water samples did not affect the virus. In a few additional controls the virus suspended in these water samples was exposed to the action of a high pH for as long as 4 hours without any decrease of the virus activity.

SUMMARY

The inactivation of partially purified poliomyelitis virus (mouse adapted Lansing strain) in natural waters was studied by chlorination of 100 ml. portions of water to which virus was added in final concentrations of 0.25 and 0.5 per cent. Samples of three different lake waters, two river waters, and one lime-treated well water were used for the experiments.

In samples of natural waters having a pH range of 7.9–8.3, the virus was consistently inactivated within 10 minutes in presence of 0.05 p.p.m. residual free chlorine at the end of this contact period. In many instances, but not always, the virus was inactivated by still smaller amounts of free residual chlorine.

In experiments at a higher pH range (pH 10.0–11.25), 0.1 to 0.15 p.p.m. residual free chlorine were necessary to achieve the same results.

Medical Care Activities of Full-time Health Departments

MILTON TERRIS, M.D., M.P.H., F.A.P.H.A., AND NATHAN A. KRAMER

Staff Director and Statistical Analyst, Subcommittee on Medical Care, Committee on Administrative Practice, American Public Health Association, Bethesda, Md.

THERE has long been a need for more adequate data concerning the medical care activities of full-time health departments. In response to many requests for information, the Subcommittee on Medical Care of the American Public Health Association instructed its staff to undertake an inquiry into the extent to which health departments provide therapeutic services in their specialized health programs, the degree to which they administer general medical care services and the type and extent of health department relationships with hospitals.*

A review of the functions of federal and state health agencies indicates that they have substantial responsibilities for the provision of medical care. The U. S. Public Health Service operates a network of 24 marine hospitals, 18 dispensaries, and 96 medical relief stations for merchant seamen, members of the U. S. Coast Guard and their dependents, federal employee compensation cases, and other beneficiaries. The Public Health Service also operates 2 hospitals for drug addicts and mental patients, provides medical service for 27 federal penal and correctional institutions, and is administratively responsible for Freedmen's Hospital in Washington, D. C.

In addition, the Public Health Service and the U. S. Children's Bureau adminster federal grants-in-aid to the states for specialized health programs, many of which include the provision of medical care to a greater or lesser degree.

Some indication of the extent of state health department responsibility for medical care is given in Table 1.†

In addition, 45 state and territorial health departments administer hospital survey and construction programs and 40 state and territorial health departments are responsible for hospital licensure.[1] The New York State Health Department administers subsidies to public general hospitals in small counties, while the Maryland State Department of Health operates several chronic disease hospitals and administers a general medical care program for the indigent and medically indigent.

No attempt was made to obtain further details concerning the therapeutic services provided by federal and state health agencies. A more intensive study, however, was made during 1947 of the medical care functions of local health departments (including state health districts) by means of a questionnaire addressed to every full-time local health department in the United States.

It is evident that the complex pattern of medical care activities of local health

* The authors are grateful to the Rockefeller Foundation for the grant of funds which made this study possible.

departments throughout the United States cannot be presented accurately and thoroughly on the basis of questionnaire responses. However, this study represents an initial attempt to obtain some picture, albeit fragmentary, of the medical care activities of full-time local health departments. On the basis of field studies currently under way, it is planned to describe at a later date and in considerably greater detail the general medical care programs administered by full-time local health departments, as well as the coördinated activities of hospitals and health departments that are jointly housed.

NATURE OF THE RESPONSE

All of the 1,385 full-time local health units in the United States were canvassed, and 50 per cent provided some information on the questionnaires. The percentage of response ranged from 44 per cent for city health units to 56 per cent for city-county units. A proportionately larger number of returns was received from the health departments serving large communities than from those serving the smaller communities. Thus, three-fifths of the health departments serving a population of 100,000 and over responded as compared with 46 per cent of health departments in

communities of less than 25,000 persons.

Returns were received from local health departments in all but 4 of the states. In 6 states with 20 or more full-time local health units the response was 65 per cent or better, while in 5 states less than 35 per cent provided returns. There were no returns received from Nevada, South Dakota, Wyoming, and Vermont, which together contain no more than 5 full-time local health units.

While the response was quite good, it should be noted that it is not a representative sample in the statistical sense. It is likely that health departments providing more extensive services reported more frequently than those whose activities were much more limited.

MEDICAL CARE IN SPECIALIZED HEALTH DEPARTMENT PROGRAMS

The precise role of the local health department in providing curative services in specialized health programs is difficult to determine. The dispersion of health functions among governmental agencies at the federal and state levels is compounded considerably at the local level where voluntary as well as local, state, and even federal public agencies either jointly or separately provide health services to the community.

Because of the broad dispersion of health functions and the numerous variations in the patterns of providing services to the community, it was not possible to obtain a truly accurate picture of the responsibility of local health departments in providing curative services in the specialized programs. Where services were administered directly by health departments there was no problem in reporting. However, in the many instances in which the health department's participation in a program was less direct, varying from the furnishing of auxiliary personnel or facilities to the authorization or referral of persons for care furnished by other agencies, there were some differences in interpretation by health officers as to the local health department's role in providing care. For example, local health departments frequently referred persons with venereal disease for care in rapid treatment centers administered by the state or federal agency; some health officers reported this activity as medical care provided by the local health department while others did not regard it as part of their local health department's services to the community.

The confusion evident in the reporting suggests that the data presented in Table 2 must be interpreted with caution and should only be considered as a rough

indication of the extent to which health departments either directly or indirectly furnish therapeutic services in these programs.

Table 2 summarizes the pattern of therapeutic services reported by health departments. Treatment includes services provided either in the office, home, clinic, or hospital, although the latter two were most frequently indicated. It is quite apparent that the health department's responsibility for providing treatment for venereal disease has been well established, in contrast with the relatively small amount of medical care reported in one of the oldest of health department activities — the control of acute communicable diseases. More than 80 per cent of the reporting health departments provided medical care for venereal disease, whereas major emphasis in the acute communicable disease programs was placed upon diagnostic services, with only 25 per cent of the reporting health departments providing treatment. The tuberculosis and crippled children's programs were characterized by a good deal of therapeutic care.

The recency of health department activities in the fields of cancer, heart disease, and mental hygiene is evidenced by the large proportion of health departments which failed to report such programs.

While information with regard to the population eligible for services was incompletely reported, in many instances diagnostic and treatment services were restricted to low income groups even in such programs as venereal disease and tuberculosis. Restrictions on the population receiving services varied with the type of care furnished. Thus, hospital care was apparently more sharply limited to low income groups than treatment in clinics, whereas diagnostic services were more frequently made available without limitations.

GENERAL MEDICAL CARE PROGRAMS

A total of 66 local health departments reported that they provided general medical care services of varied types. Only half of these health departments administered what might be considered to be fairly comprehensive programs, while the others reported limited curative services.

General medical care programs were reported in 25 states and the District of Columbia. However, apart from the state of Maryland in which all full-time local health departments administer a general medical care program, there was no major geographic concentration of programs.*

The relative frequency of general medical care programs was found to be associated to some extent with the size of the community served. The proportion of health departments providing general medical care varied from 7 per cent of the 129 reporting health units

* Only 9 of the 24 full-time local health units in Maryland replied to the questionnaire and were included in this report.

TABLE 3

Distribution of Full-time Local Health Departments Reporting General Medical Care Services by Population Served, 1947

Population Served	*Number of Health Departments Reporting*	*Health Departments Providing General Medical Care Services*	
		Number	*Per-cent*
Total	690	66	10
500,000 and over	12	3	25
100,000 – 500,000	127	17	13
50,000 – 100,000	175	17	10
25,000 – 50,000	247	20	8
Under 25,000	129	9	7

in areas with a population under 25,000, to 14 per cent of the 139 health departments serving a population of 100,000 and over (Table 3).

The programs varied considerably with respect to the scope of services provided, the precise role of the health department in administering medical care, the groups eligible for services, etc. Thus, in one instance the role of the health department in administering medical care was limited to the authorization of hospital services. On the other hand, a number of rather comprehensive programs were reported including physicians' services in home, office, or clinic, hospitalization, nursing, dental care, and drugs. Table 4 indicates the extent of the various services provided by health departments administering these programs.

TABLE 4

Number of Reporting Full-time Local Health Departments Providing General Medical Care by Type of Service, 1947

Type of Service	*Number of Health Departments*
Total health departments reporting	690
Total Programs	66
Physicians' Services	63
Office	32
Home	42
Clinic	42
General Hospitalization	20
Surgical Services	25
Other Specialist Services	29
Dental Care	22
Nursing Care	18
Drugs	47

Physicians' services were provided by various methods. In some instances the health officers actually rendered services, but generally they administered programs in which care was provided by full- or part-time salaried physicians, by private physicians paid on a fee-for-service basis, or by the staff of general hospitals operated by the health department.

Almost without exception, the medical care programs were restricted to the very lowest income groups, variously identified as indigent or medically indigent. These terms were not clearly defined by the reporting health officers. A few health departments also furnished medical care to persons in county institutions or jails. One city health department reported a rather large-scale emergency service while another provided treatment for injured city employees as well as indigent transients.

Physicians' services in home, office, or clinic were included in all but three of the programs. Physicians' services in the home were reported in about two-thirds of the 66 reported programs.

Twenty local health departments included general hospital care in their programs. However, the responsibilities of the health departments providing this service varied considerably. Five of the larger municipal health departments actually administered general hospitals,* 10 health units assumed financial responsibility for persons receiving hospitalization, while 5 health departments were responsible only for authorizing hospital care. The number of persons receiving hospital care during 1946 ranged from 20 in one county to approximately 25,000 persons in one of the larger cities.

Fairly extensive specialist services were available in the larger city programs, particularly those in which the hospitals were administered by the health department. However, few of the smaller programs reported such services. The specialist services reported included surgery, dermatology, cardiology, eye, ear, nose, and throat, gynecology, pediatrics, and psychiatry.

Dental and nursing services were available in about one-third of the reported programs. Few details were supplied with regard to dental and nursing care, but they did not appear to represent extensive services except in a few instances. About two-thirds of the 66 health departments which reported pro-

* Philadelphia, Pa., Washington, D. C., San Francisco, Calif., Kansas City, Mo., Louisville, Ky.

grams provided some drugs for authorized persons, either through clinic or hospital dispensaries or through arrangement with private pharmacies.

Laboratory services including blood chemistry, clinical bacteriology, urinalysis and x-rays were generally provided by the health departments, although it was not possible to differentiate between the services furnished in connection with the specialized and the general medical care programs. These services were provided by various agencies such as hospitals, branch state laboratories, and local health department laboratories.

HOSPITAL-HEALTH DEPARTMENT RELATIONSHIPS

Evidence of the character and extent of hospital-health department relationships is presented in Table 5. The performance of various health department functions in general hospitals was reported by a little over one-fourth of the health units reporting. Although reporting on specific activities was incomplete, the utilization of hospital facilities was most frequently noted in connection with the tuberculosis and venereal disease programs, with 92 health departments maintaining tuberculosis clinics or having chest x-rays performed in hospitals, and 60 health departments utilizing hospitals to provide diagnostic and treatment services for venereal disease. The housing of crippled children's clinics in hospitals was mentioned by 31 health departments, maternal health clinics by 23, child health clinics by 17 health departments and cancer clinics by 14 health departments. Only 4 health departments indicated the utilization of hospitals for dental clinics even though almost half of the reporting health units provided dental services as part of their public health program. A few health departments mentioned the use of hospital facilities for cardiac and mental hygiene clinics; these are relatively new health department activities and most of the reporting health units did not administer cardiac and mental hygiene programs.

Thirty health departments indicated that their laboratory services were performed in hospitals. Other health department activities conducted in hospitals included immunizations and tonsillectomies.

More than a third of all reporting health officers indicated that they were members of the medical staff of a general hospital. Appointment of health officers to general hospital staffs has been recommended in the recent policy statement on "Coördination of Hospitals and Health Departments" by the American Hospital Association and American Public Health Association.[2]

Only 8 health departments reported that they were housed in combination with a hospital, while 23 reported that they were housed adjacent to one. The American Hospital Association and the American Public Health Association have "strongly recommended that,

TABLE 5

* Few local health departments licensed hospitals; inspection was usually limited to maternity sections of hospitals and sanitary inspections of hospital facilities.

wherever circumstances justify and permit, there should be joint housing of hospitals and health departments, and, if possible, the offices of physicians and dentists. Although coördination of the activities of hospitals and health departments can be accomplished even if they are not closely integrated physically, it is most feasible when there is joint housing of the hospital and health department. The common use of laboratory and clinic facilities, which is difficult to achieve when the two institutions are physically separated, occurs readily when they are housed together. The planning of integrated programs is facilitated by joint housing and their administration is made smoother and more efficient."[3]

That there is now a trend toward joint housing of hospitals and health departments is indicated by the fact that of the 107 applications received by the U. S. Public Health Service up to December 31, 1948, for the construction of health centers, 25, or about one-fourth, contemplated a combined health department-hospital unit.[4]

Hospital licensure is fundamentally a state agency responsibility. Although hospital inspection and licensure was reported by approximately one-fourth of the local health units reporting, only a few of the larger health departments actually licensed hospitals. The activities more commonly reported were inspection of the maternity sections of hospitals and the sanitary inspection of hospital facilities. In a few areas state licensure of hospitals and convalescent homes is preceded by local health department inspection and approval.

SUMMARY

Data are presented on the substantial responsibilities of federal and state health agencies for the provision of medical care.

Information on the medical care activities of local health departments was obtained by means of a questionnaire sent to each of the 1,385 full-time local health units in the United States. Responses were received from 690 local health departments, or approximately one-half of the total.

Although it has not been possible, on the basis of questionnaire responses, to present a complete and accurate picture of the curative services furnished by full-time local health departments, the data obtained serve to confirm the fact that a considerable number of health departments have advanced beyond the stage of assuming responsibility for purely preventive services. In every one of the specialized health programs administered by local health departments, a substantial number of health units reported the provision of therapeutic as well as diagnostic services. Furthermore, a significant though relatively small number of local health departments reported that they were administering general medical care programs. Considerable variations were noted in the scope and content of these programs, ranging from minimum services to the provision of rather comprehensive general medical care.

While combined or adjacent housing of hospitals and health departments was infrequent, one-third of the reporting local health officers stated that they were members of the medical staff of general hospitals, and approximately one-fourth of the reporting health departments have achieved working relationships with general hospitals, utilizing their facilities for various health department programs and activities.

Histoplasmosis: Study of Reactors to Histoplasmin.

J. W. ARMSTRONG, M.D.

Berea College, Berea, Ky.

THIS study of the reactors to histoplasmin as compared to those reacting to tuberculin was carried out at Berea College, Berea, Ky., by the Student Health Service with coöperation of the State Department of Health of Kentucky.

Berea College is located on the border of the Southern Appalachian mountain area. Most of the students come from the mountain counties of 8 states—Kentucky, Tennessee, Virginia, West Virginia, North Carolina, South Carolina, Georgia and Alabama, mostly from rural homes. The largest group comes from Kentucky.

Histoplasma capsulatum infections have been found in part of this area. The Berea College Student Health Service has carried on a tuberculosis case finding study since 1931. Thousands of roentgenograms have been made. Many students were found with lung calcifications who had a negative tuberculin test. Some of these were rejected by Selective Service on the basis of roentgenograms.

The publication of the studies of Christie and Peterson [1, 2] and the report of Palmer [3] demonstrated by the means of skin tests the probability of benign histoplasmosis in part of this area. We questioned whether the lung calcifications in our students might have this histoplasmosis as an etiological factor. Previous reports by Darling [4–6] and Parsons [7] had suggested this condition as a fatal infection only rarely seen. After correspondence with Dr. Palmer and Dr. Christie concerning our situation and program, we instituted a special study in November, 1946.

Histoplasmin was obtained from the U. S. Public Health Service. It was used in 1:1,000 dilution; 0.1 ml. was injected in the forearm intradermally. Purified Protein Derivative of Tuberculin (Parke, Davis & Company) was used for the Mantoux test which was given at the same time. The dosage was 0.0001 mg. on advice of Dr. Palmer.[8]

All tests were read in 48 hours. Chest roentgenograms, using 14 x 17″ x-ray films, were made possible by the cooperation of the Tuberculosis Control Division of the Kentucky State Department of Health. Flat films were taken of about 1,200 students. On 1,004 of these we had complete data, and they are included in Table 1. Incomplete information was largely in the field of residence data.

The films were read by the writer and by Dr. E. N. Maxwell of the Kentucky State Department of Health. They were read independently and, also, together, to correlate results. Readings were made without knowledge of the skin test reactions. Data were obtained in regard to age, sex, and residence.

The tables show the results of analyzing the total data. If a person had moved about so that there was no one long continued residence, we left residence unclassified. No one knows how long a residence is required to become

a reactor. If all but four years had been in a home county or adjoining county, the residence was classified. In many cases the numbers from a given county were so small as to have little statistical significance. This is also true of some state groups. The figures are given for what they may be worth.

The majority of those tested fell in the age group between 16 and 24. The numbers in other age groups are too small for statistical purposes. They include faculty members and some faculty children. Data on some of the younger children, who have lived in Berea only, suggest that a long residence is not necessary to become sensitized to histoplasmin. The other age groups are included to complete the picture as we found it. Thirty-three per cent of those tested reacted to the Mantoux test, 41 per cent of the males and 25 per cent of the females. Fifty per cent of those tested reacted to histoplasmin, 58 per cent of the males and 44 per cent of the females. Some of the skin test results

were questionable. These are not recorded in the tables but they account for the differences in totals with Mantoux compared to totals with histoplasmin test. Table 1 presents a summary of the test results by sex and age. (Statistical data were compiled with the assistance of the State Department of Health.)

The summary of the results of tuberculin tests in 91 colleges this same year showed 22.6 per cent males and 9.4 per cent females as reactors, or 19 per cent of both.[9]

Table 2 classifies the reactors according to residence. It willl be noted that the highest percentage of reactors was found in those giving Kentucky and Tennessee as their residence. Because most of our students come from the mountain counties of the South we have separated the residence by mountain area and so-called plain area of those states. The number with residence out of the mountains and in other states is too low for statistical value but shows our findings.

Madison County of Kentucky, in which Berea is located, is on the border of the mountains and the Blue Grass area. Over 100 individuals living in the county were tested with 70 per cent reactors.

Table 3 emphasizes the importance of the tuberculin test if we are to find those who have been infected. Lung calcifications alone cannot be used in this area as evidence of primary tuberculosis. Fifty-one per cent of those found with lung calcification had negative Mantoux tests. Only 13 per cent of those positive to Mantoux and not to histoplasmin test showed lung calcification, while 22 per cent of those positive to both showed calcification. There were 71 individuals with x-ray findings identical with those usually called calcification due to tuberculosis who had no reaction to the Mantoux test but were positive to the histoplasmin test. Histoplasmosis must be considered in the future in the differential diagnosis of lung calcifications found on reontgen-ray examination along with tuberculosis, coccidioidomycosis and sarcoidosis.

Table 3, classification of the roentgen-ray findings, is self explanatory. The questionable cases and those with no films recorded are included to show their distribution in the skin tests.

Clinical signs and symptoms of fatal histoplasmosis were reported by Parsons and Zarafonetis,[7] McLeod, Emmons, Ross and Burke,[10] and Christie.[1, 2, 11] We are especially interested in the symptomatology of subclinical cases discov-

TABLE 3

Summary of Roentgen-Ray Findings

Classification	*Pos. Mant. Pos. Hist.*	*Pos. Mant. Neg Hist*	*Neg. Mant. Pos. Hist.*	*Neg. Mant. Neg. Hist.*
1. Negative	118	124	246	327
2. Definite hilar calcification	5	3	15	4
3. Probable hilar calcification	3	0	4	3
4. Definite parenchymal calcification (1–4 foci)	15	4	21	1
5. Probable parenchymal calcification (1–4 foci)	8	1	6	2
6. Parenchymal calcification (5 or more foci)	0	1	0	0
7. Definite hilar and parenchymal calcification	15	3	16	4
8. Probable hilar and parenchymal calcification	3	1	2	0
9. Definite hilar calcification, probable parenchymal	0	1	4	1
10. Probable hilar and definite parenchymal calcification	1	0	3	0
11. Questionable calcification	7	6	0	10
12. Parenchymal infiltration or cavitation	0	4	0	0
13. No x-ray	49	10	56	76
14. Other chest pathology	0	1	1	1
Total positive x-rays	50	18	71	15

Two previously unknown active cases of pulmonary tuberculosis were discovered in this survey.

ered by the skin test and roentgenogram studies. We have not that information now. Long-term studies should be carried out with children living in areas where the tests show a high percentage of reactors to histoplasmin. Careful clinical history recorded as the children grow older, plus repeated skin tests and roentgen examinations, may reveal a symptom complex. We know that children develop histoplasmin reactions early in life and show extensive pulmonary calcification as well. So these studies must be begun early in life.

Some question the validity of the assumption that we are really discovering subclinical cases of histoplasmosis in this way. Others question the specificity of the test. And there are those who disagree with the assumption that the lung calcification revealed in a study such as this may actually be due to histoplasmosis. But there does seem to be good circumstantial evidence, and thus far no other explanation has been found to fit the picture.

These studies emphasize the importance of the histoplasmin test in this area. They show that the tuberculin test continues to have importance since we cannot differentiate by films between the lung calcification of primary tuberculosis and this condition.

SUMMARY

1. Results of skin tests using tuberculin and histoplasmin in students at Berea College are shown in tables.

2. The finding of 50 per cent positive reactors to histoplasmin further confirms this area as one infected with the fungus.

3. The tables show the relationship between reactors to tuberculin and histoplasmin and the x-ray studies of the group.

4. A significant number of students with negative tuberculin tests but positive histoplasmin tests showed lung calcification.

5. The tuberculin test is still an important procedure in the diagnosis of tubercular lung calcification.

6. Emphasis is placed on the need for long continued studies of small children in this area to discover the symptomatology of subclinical histoplasmosis.

Needs and Future Prospects for Integrating Marriage and Divorce Data With Other Vital Statistics*

SAMUEL CLAYTON NEWMAN, PH.D.

Federal Security Agency, Public Health Service, National Office of Vital Statistics, Washington, D. C.

THERE is widespread and increasing recognition of the importance of family data for many aspects of public health. Examples of this recognition are not hard to find. Records on various types of diseases are kept on a *family* basis. Even in the formation of a family, about three-fourths of the states have provided by law that persons getting married must meet certain health standards. Not only the immediate physical implications in such matters as contagion, home care, etc., but also the broader health implications of the effects of family relationships on the person's physical and mental well-being are obvious, particularly for chronic diseases and for rehabilitation. Moreover, the growing emphasis on community and social welfare aspects of health makes family data indispensable for broader analysis.

Yet, in at least one important segment of our knowledge about the family, our data are sadly lacking. I refer to detailed information about marriage and divorce; the former has been termed "the birth of the family," while the latter may be thought of as "the death of the family"—not its exclusive type of mortality, but a growing type in recent decades. So we have this paradox: there is recognition everywhere of the health implications of the family—even registers are kept on a family basis—but our knowledge is deficient on such elementary matters as how many families are being formed and dissolved, and what are the characteristics of the people to whom these events are occurring.

Although the United States is in the forefront in the achievement of knowledge about many aspects of health and welfare, it lags behind many other nations in the matter of detailed vital statistics of marriages and divorces. Many people still do not realize how deficient this nation is in such data. Almost daily, requests are received by the National Office of Vital Statistics in the Public Health Service of the Federal Security Agency from health workers, sociological researchers, other investigators, public speakers, and writers, and people in all walks of life, for statistical details on marriages and divorces, such as they are accustomed to receive on the vital statistics of births and deaths; and many of them seem surprised when such data cannot be furnished. The present program of the National Office of Vital Statistics with respect to marriages and divorces provides only figures (in some cases, estimates only) on the numbers of occurrences with no detailed statistics of any

* Read before the Statistics Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

kind.[1] National statistics on age, place of residence including population-size group, rural-urban, etc., previous marital status, number of former marriages and how terminated, duration of marriage prior to divorce, divorces granted to parents and to childless couples, legal grounds ("causes") of divorce, and other items needed to throw light on many questions concerning family formation and family dissolution, are lacking.

As might be expected, where data are lacking, some people rush in with broad answers not based on facts. An outstanding example of this is the erroneous use of the ratio of divorces occurring in a single year to marriages occurring in that year as an indication of how many marriages do or do not end in divorce. We have all seen the widely quoted assertion that "one out of every three marriages is ending in divorce." This is based on a misinterpretation of 1945 figures. In that year, there was approximately one divorce granted for every three marriages performed; but most of those divorces were not granted to the people who got married that year, nor were one-third of all marriages ending in divorce that year! Only if such a ratio remained constant for years would this interpretation be valid. As a matter of fact, the ratio changed to approximately "one in four" in the two succeeding years, 1946 and 1947, but the publicists seemingly prefer to misuse the "one in three" ratio rather than the "one in four." In calling attention to this misuse, I am not overlooking the fact that the divorce rate has increased drastically in this nation during the 81 year period for which we have national estimates; but I am citing the misuse merely as one example of situations where adequate data are lacking from which interpretations could be made having obvious importance for health planning.

Not only is a nation-wide program of detailed marriage and divorce statistics lacking, but many states have no systems of centralized records of marriages and divorces which would pave the way for state and national statistics. Even in those states in which the original records are retained by the county officials, it would be possible to get *copies* centralized in the state health departments. In the absence of centralized records of marriages and divorces in each state vital statistics office, investigators seeking information about these occurrences, as well as individuals seeking copies of such records for legal and personal uses, are confronted with a maze of different record systems and with the sometimes hopeless task of searching among hundreds of county and other local offices.

The same situation once existed with respect to mortality and natality records and statistics in the United States. No national statistics were available, and many states had no central records of births and deaths. For several decades, coöperative state-federal efforts were devoted to building national registration areas for births and for deaths—admitting each state to these areas as it established adequate provisions for centralized records and attained a required degree of completeness in registration. The American Public Health Association played an important role in that development, including activities to support the passage by the United States Congress in 1903 of a Joint Resolution urging the states to coöperate with the Census Office (in which vital statistics work was then located).

Many individuals and organizations are now recognizing the need and requesting action to accomplish not only a program of detailed statistics of marriage and divorce but also state centralization of records on which such a program depends. The Association of State and Territorial Health Officers endorsed, in December, 1946, the central registration of marriage records and

certificates or official abstracts of divorce records in state health departments. The Council on Vital Records and Vital Statistics has shown an active interest in this area, and has a Committee on Marriage and Divorce working on various related problems. The American Association of Registration Executives directed its officers, in March, 1948, to seek a Joint Resolution by Congress urging state coöperation on marriage and divorce registration along the lines of the 1903 Joint Resolution on birth and death registration. The American Sociological Society, the Population Association of America, the Technical Advisory Committee on Population for the Seventeenth Decennial Census, are among the groups which have recently called for more adequate marriage and divorce statistics.

Such a marriage and divorce program would not be entirely new. Dr. Bernard M. Cohen, who was in charge of our marriage and divorce statistics around 1940, presented plans for a program of detailed marriage and divorce statistics, based on state centralization of records and on national registration areas, at the 1940 meeting of this Section, and his paper was later printed in the *Journal* of this Association.[2] At that time, an editorial in the *Journal* endorsed the idea, and stated:

> Marriage and divorce, therefore, in terms of potential births and in relation to fertility and fecundity, have definite biologic implications, and records of them constitute an important part of the broad subject of vital statistics. That such records should be available and utilizable, and utilized, as are birth and death certificates, is a goal properly to be sought in the interest of the public health.[3]

The proposed program was started, but these first steps were halted soon after the outbreak of World War II. Now, the National Office of Vital Statistics again plans to proceed with the development of registration areas, recommended procedures, minimum items, standard certificates, recommended tabulations by state offices, and other necessary steps. None of this can be done without the active, continuing assistance and advice of health interests and of everyone concerned. We are unable to predict when funds may become available for a full-scale program, but we propose to accomplish as much as possible in this development, in advance of a full-scale program.

It is encouraging that an increasing number of states have provided by law for integrating their marriage and divorce records and statistics with their other vital records and vital statistics in the state health departments. About three-fourths of the states now have central records for marriage, and about one-half for divorce. Not all of these have full-fledged systems from which the data we would need could be furnished. All of us are aware of the importance of continued efforts to the end that these systems be improved in states where they exist already, and that they be introduced in the remaining states which have no central marriage and divorce records. Again, it is encouraging that many of the vital statistics offices in state health departments, not having centralized records, have evidenced real interest in the problem, and have furnished invaluable assistance by obtaining state totals on numbers of occurrences.

Going beyond the immediate goals for developing the frameworks of state records and of state and national statistics, we may foresee a day when health workers and others will have adequate marriage and divorce data, as an essential segment of broadening human knowledge about family and community health and welfare. Such a broad picture is incomplete without marriage and divorce data; and, in turn, the marriage and divorce data themselves will become more meaningful as they are related to the whole pattern of health and well-

being of the family in the community, the state, and the nation.

Second Annual Psychiatric Aide Award

Roland J. Brand, attendant at the Milwaukee County Asylum, Wisconsin, recently received the second annual "Psychiatric Aide of the Year" Award for 1948. The award, given for his achievement in removing restraints from 32 male patients on the most disturbed ward at the Milwaukee institution, overnight, and in completely banishing the continued practice of restraints on his ward and thereby setting an example for the rest of his fellow employees, includes a cash prize of $500 and a citation.

In announcing the award, which is given by the National Mental Health Foundation, and in 1948 with the coöperation of Catherwood-Kirkbride Fund for Research in Psychiatry, Philadelphia, the foundation's president, Richard Hunter, told how Mr. Brand had removed all restraints from patients in his ward after visits to an Illinois State Hospital where restraints have been prohibited by law for many years.

The foundation created the annual award as "a valuable instrument in gaining public interest for its program of bettering the situation of the aide through adequate training, improved working conditions, and public appreciation for his role in the care of the mentally ill."

Five other candidate aides for the 1948 award received $50 awards and honorable mention for their exemplary performances in the care of the mentally ill. They are:

Elizabeth Guy, St. Elizabeths Hospital, Washington, D. C.

Zella Bauer, Chicago State Hospital, Chicago, Ill.

Joe Collins Hisle, Jr., Veterans Administration Hospital, Lexington, Ky.

John Robert Hull, Ypsilanti State Hospital, Ypsilanti, Mich.

Thomas R. Cobb, Jr., Veterans Administration Hospital, Roanoke, Va.

Plans for the 1950 Population Census*

A. ROSS ECKLER, PH.D.

Deputy Director, Bureau of the Census, Washington, D. C.

SEVENTEEN months from today will be Easter of 1950. By that date one third to one-half of the population should have been enumerated, but even under the most favorable conditions, it is unlikely that many of the staff associated with this gigantic undertaking will fully enjoy the peaceful tradition of the Easter season.

In preparation for the forthcoming Census of Population, the staff of the Census Bureau has been actively engaged in several types of preparatory work for the past year and a half. These have taken three major forms: (1) discussions of, and experimentation with, schedule content; (2) procuring and preparing the necessary maps, and making improvements in geographic classification, and (3) testing certain alternative field and office procedures. I shall refer briefly to some of the conflicts which we face in planning for the 1950 Census of Population. For example, in this census as in preceding ones, there are strong pressures being exerted in behalf of many new questions, but there is much evidence to indicate that we ought to reduce the size of the questionnaire rather than increase it. The costs of census operations have risen so sharply since 1940 that we must adopt all possible means of economy. Nevertheless we recognize urgent needs for a number of changes that would considerably improve the quality of the 1950 Census but would increase costs even above the levels resulting from price changes. We need to defend these improvements in quality at a time when the pressure upon governmental budgets is particularly great. I wish there were time to tell you about some of these improvements, for I believe the users of our figures have a real stake in any program that will improve the coverage and quality of census statistics.

I shall, however, confine myself to a brief discussion of several subjects which pertain more closely to the interests of this group. These include a brief consideration of the proposed schedule content of the 1950 Census of Population; discussion of the proposed new urban-rural classification of the population; the tentative plans for matching Population Census returns and birth records; and the program for the Hemisphere Census. It should be borne in mind, of course, that most of our plans are subject to revision in the light of the appropriations finally made available by the Congress some time next spring or summer.

SCHEDULE CONTENT

During the past year we have held a series of meetings of advisory committees in various subject fields in order to obtain recommendations regarding proposed questions and procedures for the next census. You will be glad to know that two staff members of the U. S. Public Health Service have served on the advisory committee concerned with demographic problems. We have stressed to the committees our belief

* Presented before the Statistics Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

that every effort should be made to limit the census to those questions most urgently needed. We have stressed this both because of the high costs of census taking and because of the fact that the burden on the enumerators should be held down as much as possible. Unfortunately, many of those suggesting additional work to be done often have a very inadequate idea of the difficulties attached to the job. The problem of recruiting more than 150,000 inexperienced enumerators, of acquainting them with dozens of forms, instructions, and schedules, of providing them with the maps and detailed boundary descriptions necessary to canvass an area of two billion acres, and of insuring that they visit over 40 million separate households would be very difficult, even if the organization for this purpose were in continuous operation. However, most of the large organization responsible for this job must be newly created and within a comparatively brief time must learn about the administrative and technical aspects of the undertaking. It is obvious that the addition of more and more questions, especially those of a complex nature, adds greatly to the task of training this newly recruited organization and exposes the Census Bureau to the very real danger that the training will be spread over so many complicated concepts that the enumerators and supervisors are not well equipped to meet their responsibilities. Furthermore, as the questionnaires are increased in length, there is always the danger that the respondents will become fatigued and annoyed, so that the quality of the information collected will be impaired.

The members of the several advisory committees have concurred with us in the belief that it is necessary to hold down the size of the census schedule and have supported a 1950 program that we hope will prove a little easier to carry out than the 1940 job. There are, of course, a number of changes of questions within this basic framework but none that would be of immediate concern to many of this group.

I should like to refer briefly to a question or series of questions on the physically handicapped which has been proposed for the 1950 Census under the terms of a bill introduced before the 80th Congress. We have indicated our opposition to such legislation and hope that many of you will concur in our belief as to its undesirability. We have much experience from earlier censuses to show how erratic is the enumeration of handicapped groups of the population. This is to be expected because of the reluctance of many people to report any situation which would reflect upon the family and because of the difficulty of training 150,000 enumerators to apply consistent rules to such a complex subject as physical handicaps.

We do not, however, take a purely negative view about counting handicapped individuals. We believe that there are undoubtedly important purposes to be served by such data and stand ready to carry out experimental work to measure the incidence of physical handicaps through sample surveys. Our Current Population Survey provides a means by which work of this kind can be carried out on the basis of a sample of proved reliability and in fact some limited work of this kind is already under way. In the long run it seems probable that the need for this kind of information, as well as for many other types, can be met in part through sample surveys which will provide information on the population and its characteristics at dates between the census enumerations.

In this connection it is interesting to note that the publishers of agricultural journals have recently expressed strong support for an annual sample survey of agriculture to give information on production and inventories

between the quinquennial Censuses of Agriculture.

URBAN-RURAL CLASSIFICATION

For many years the classification of the population into its urban and rural components has been relatively unsatisfactory. In general, we have classified as "urban" that part of the population residing in incorporated places of 2,500 and over, and have applied certain special rules mainly in New England where many sizable urban communities are not incorporated. On the basis of our procedures, such urban places as Bethesda and Silver Spring on the outskirts of Washington have been classified as rural-nonfarm, and, on the other hand, the primarily rural population outside of the unincorporated urban places in many New England townships has been classified as urban because of the procedure of treating the township as a unit. It is conceded that such misclassification has considerably reduced the value of the urban-rural subdivisions of our tabulations since it has blurred the differences between these major segments of the population.

Partly because of the availability of new map materials, notably aerial photographs, we have been able to attack more effectively than hitherto the problems of improving the classification of the urban-rural population. In the first place we have proceeded to set boundaries for all unincorporated places of 800 or more. In 1950, therefore, we can classify as urban all places of 2,500 or over regardless of the fact of incorporation. Likewise through office and field work we shall be able to classify as urban the people in the built-up areas around large cities of 50,000 and over. We believe that these steps will provide us with a population classification that will be much more useful to many types of consumers of census statistics.

We recognize, however, that there are certain problems attached to the use of the new figures for the computation of the various vital rates with which the members of this group are greatly concerned. Consequently, in 1950 we plan to present certain tabulations both on the basis of the old urban-rural classification and the new improved classification. We hope that the National Office of Vital Statistics will encourage states to adopt procedures for the processing of birth and death certificates and other vital records so that these important demographic statistics may in time be properly allocated through addresses to the new types of areas set up for census purposes. To the extent that this large job can be carried out during the next decade, we may look forward to much more meaningful vital rates for the urban and rural segments of states and counties by 1960.

COMPARISON OF CENSUS RETURNS AND BIRTH REGISTRATIONS

Many of you are familiar with the 1940 program for matching of infant cards collected by census enumerators with birth records from the state registrars. We believe that the decennial census offers a unique opportunity for evaluating the validity of two sets of basic records and for improving the usefulness of both. We shall be able to obtain from this matching of records a measure of under-registration in the several states as well as evidence on the factors that contribute to the under-reporting of babies in the census.

We are currently working with the staff of the National Office of Vital Statistics in developing techniques for this major statistical undertaking which will not run counter to the legally imposed responsibilities of the several agencies which must participate. The problem in 1950 is somewhat complicated by the fact that in 1950, unlike 1940, the basic records which must be brought together will be in the hands of two different agencies. Under the pro-

visions of law, data collected by the Census Bureau can be used for statistical purposes only, and must not be employed for taxation, regulation, and other administrative ends. However, we hope to be able to develop procedures which will enable us to realize the very real statistical gains potentially available from this matching operation.

CENSUS OF THE AMERICAS

Plans being actively sponsored by the Inter American Statistical Institute call for taking of censuses throughout the Western Hemisphere in the years 1949 to 1951. The value of such an undertaking is particularly great for public health authorities since it will make possible the development of much more nearly comparable vital rates throughout the Hemisphere. In the development of this program there has been reassuring evidence of the ability of nations with many diverse interests and problems to get together on minimum standards to which all would adhere. At this very time over 50 representatives of 16 countries are meeting in Mexico City for a training program in connection with the 1950 Hemisphere Census and the World Census of Agriculture being sponsored by the Food and Agriculture Organization of the United Nations. During the past year we have trained more than 60 representatives of the American nations in various types of census procedures and have provided special assistance to a considerable number of countries throughout the Western Hemisphere. Assistance has also been given to about 20 representatives from a wide range of countries outside the Western Hemisphere.

We welcome these opportunities for better understanding and hope that broader opportunities for this kind of work may be developed under legislative approval for setting up on a world-wide basis programs which have hitherto been restricted to this hemisphere.

The New York State Home Accident Prevention Program*

I. JAY BRIGHTMAN, M.D., F.A.P.H.A.

Assistant Director, Division of Medical Services, New York State Department of Health, Albany, N. Y.

THE New York State Department of Health entered the home accident field in 1942 with the establishment of a safety program in its Office of Public Health Education. This program was primarily educational and much has been accomplished in stimulating many official and voluntary state agencies to partcipate in home and farm safety programs within the province of their respective responsibilities. Advisory subcommittees were organized for the purpose of bringing to the department expert advice from physicians, architects, farm leaders, home economists, and safety engineers. These subcommittees have supplied the department with technical information regarding safety within their own fields, and have thus assisted in the publication of useful educational material both for the general public and for special groups.

Two recent developments in New York State have given rise to a considerable broadening of the home accident program. First, the activities of the State Department of Health were reviewed by the Commissioner and his staff and it became quite apparent that a well directed approach to the home accident problem calls for the utilization of several public health tools in addition to education. There is a definite need for epidemiologic studies to determine the basic environmental and personal factors peculiar to accidents in any given area, for case finding of accident-prone individuals, for provision of clinical facilities for correction of mental and physical disorders related to proneness, and for research. To implement these additional activities, the home accident program was reorganized as a section of the Division of Medical Services, which is responsible for the planning and operation of special public health programs of this type. From this vantage point, the Home Accident Section works closely with the Bureau of Maternal and Child Health in those phases of its work relating to child safety, and participates in the planning of health programs for the later years of life during which accidents are such a frequent cause of disability and death. As do all special service programs, it receives the cooperation of the Offices of Public Health Education and Vital Statistics in their respective fields, and obtains the assistance of the Division of Local Health Services, with its Bureaus of Public Health Nursing and Sanitary Engineering, in bringing the program into the field through the district health offices and the full-time city and county health departments.

The second development was the establishment by the legislature of a State Division of Safety responsible directly to the Governor. The purpose of this division is to " coördinate the safety activities of the various state departments, and to coöperate with local governments, civic and voluntary organizations, and other interested agencies in a

* Presented at a Joint Session of the Public Health Education and Statistics Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 12, 1948.

state-wide coöperative effort to provide the fullest possible protection for lives and property within the State of New York." The Division of Safety provides the means whereby the interests of each of several state departments engaged in accident prevention may be coördinated to mutual advantage. For example, the problem of home safety is of utmost importance to industry, as injured workers are kept away from their jobs regardless of where the accident occurs. Reciprocally, industrial plants provide an excellent means of reaching large numbers of individuals with educational material on home safety. The Division of Safety offers the meeting place whereby the respective programs of the Deparment of Health and the Department of Labor may be integrated.

In addition, the Division of Safety is taking on the responsibility for the organization of safety committees at the local level, such committees to have subdivisions for home accident prevention as well as for the other major categories of accident control. Thus, for a community home safety program, the Division of Safety tackles the problem of bringing together all local agencies which can develop active participation, while the Department of Health is responsible for providing the necessary educational materials and methods, for establishing patterns for epidemiologic study and case finding, and for encouraging the local health officer and his staff to participate in the local programs and to show leadership.

This is a very important step forward because, while safety councils have been established in most large cities and in several counties, the home accident problem has too often been sidetracked because of the greater emphasis placed upon industrial and highway safety. Both official and voluntary agencies have been responsible for this situation. Despite the participation of the State Health Department in a home safety program since 1942, the number of community programs with active participation by local health departments has been very small. This dearth of official support was clearly revealed by the 1947 American Public Health Association *Evaluation Schedules* for accident control recently filled out by cities and counties in New York State.

Among many voluntary agencies, there is a considerable lapse between the acceptance of a program by the policy making group at the federal or state level, and the adoption and execution of that program by the local chapters. The planning must, therefore, be both horizontal and vertical. On the horizontal plane the State Department of Health and the State Division of Safety will continue to encourage other state official and voluntary agencies to accept home safety as a suitable activity for their organizations. Equally, or even more important, is their task on the vertical plane to assist the local health departments and safety committees in enlisting the coöperation of the local units of these other agencies in the inauguration of a successful program.

HEALTH DEPARTMENT ACTIVITIES IN HOME ACCIDENT PREVENTION PROGRAM

The prime objective of the Home Accident Prevention Program is the prevention of sickness, disability, and death attributable to accidents occurring in the home and its immediate environment. To achieve this objective, the following functions must be carried out:

1. Education regarding home accident control directed at the public, the medical profession, other health workers, and voluntary agency representatives.
2. Epidemiologic investigation of home accidents.
3. Case finding and provision of clinical facilities for the treatment of persons found to be unusually susceptible to accidents.

4. Research regarding causes of accidents and methods of prevention.
5. Consultation and coöperative planning with other agencies concerned with safety.

A home safety program requires intimate contact with the home, and the above functions must be the responsibility of the local health department although other agencies represented on the community safety committee can and should render active assistance. It is the responsibility of the State Department of Health to establish the patterns for carrying out these functions, to supply the necessary materials to help the local efforts, such as exhibits, brochures, and films, to assist in the training of personnel, and to set up demonstrations both for the purpose of showing how the job can best be done, and for experimenting with new methods of approach. The following is an outline of how these familiar public health tools may be applied to the home accident program:

1. EDUCATION

In the home accident problem public health education must apply the same general techniques which have been used in other fields in which personal habits play such an important role. An educational program must be prepared both for the public and for the special professional or service groups which can participate in getting the message across.

a. Public Education—The educational approach is designed to familiarize people with the accident hazards with which they may come in contact, to demonstrate to them methods of safely carrying out routine activities, and to motivate them to apply principles of safety in every walk of life. A well informed and highly motivated person, free from serious physical defects, is resistant to accidents.

Experts trained in mass educational procedures tell us that people do things for their own good or for the good of their community only when they are requested to do so by someone quite close to them. Therefore, it is necessary to reach right into the home to carry out a satisfactory educational program which may reduce accident morbidity and mortality. Talking to large groups, organizing big committees, arranging lots of meetings comprise so much window dressing unless these activities are recognized as a means and not an end, and they are utilized only to stimulate the development of more basic plans. High power publicity through the radio, the press, the movies, and posters about the town, is of great value in informing people that the problems exist and in preparing them to act favorably if and when the matter is brought to their personal attention by someone close to them. However, if publicity and meetings are the major achievements of the program, people adopt the attitude that the problems which they hear and read about, while true, apply to someone else and not to themselves.

Families can be stimulated to promote safety principles and methods within their homes by one of two ways—either by monitoring by individual members of the family, or by having these principles and methods pointed out to them by someone with whom they are familiar. For the first approach, children can be reached through the schools, the 4-H Clubs, and the scout organizations. Parents can be reached through the P.T.A.'s, women's clubs, men's service clubs, church organizations, granges, and the like. These then are the specific groups which the local safety committees must bring into the program. As a corollary, only groups which can play a specific part in getting safety information into the home should be asked to participate. A speaker should be assigned to such an organization only if a definite plan for carrying out a safety program has been arranged or is to be proposed. A talk on safety should outline the steps which the members of the organization can take, such as (1) the appointment of a safety committee, (2) the distribution of check lists to each of the members, (3) an analysis of the completed check lists by the safety committee to determine the number of hazards existing in the homes of the members, (4) plans for the elimination of such hazards. A really effective program will include (5) a repeat of the check list survey three or six months later for the purpose of determining how many of the hazards have actually been corrected. In this way every member of every coöperating agency plays an active role in the program, and the principles of safety are introduced into a high percentage of homes in the community.

The second approach to the home is through persons who have frequent and intimate contact with it. This group includes the practising physician, the public health nurse, the social

worker and, occasionally, the sanitary engineer. These individuals are trained observers and investigators, and can play a helpful part in pointing out accident hazards to the members of the family, distributing informational material and assisting with check lists. Also, the servicemen of the utility companies and the delivery men of bakeries and dairies are well known to the family members and are in a good position to make suggestions regarding the elimination of accident hazards and to leave educational brochures or posters. Indeed, it is to the advantage if these employees and their companies to have them take part in such a program inasmuch as it is they who may readily suffer the consequences of broken steps, of objects being left on the outside or cellar stairways, or of inadequate lighting with lots of junk in the basement in the vicinity of the gas and electric meters.

b. Education of Participants — It is the responsibility of the health department to provide inservice training for its local health officers, nurses, and engineers in the principles of accident prevention so that they will be in a better position to carry safety information into the homes which they visit, assist in the elimination of hazards, and to work with local groups in a community safety program. Another important function is the training of members of voluntary agencies so that they may serve as speakers and group leaders in the safety campaign. Voluntary agencies frequently employ persons already trained in safety, but most often these do not meet the needs. In New York State the Health Department has conducted institutes for designated representatives of the participating agencies, and at the present time there are at least 24 such workers conducting safety programs within their groups.

Practising physicians must be kept informed as to the problems involved in home safety and the importance of their role in stimulating their patients to live in a safe manner. The Medical Society of the State of New York has appointed a subcommittee of its Council Committee on Public Health and Education to work with the State Department of Health in this particular field. This is the same pattern of coöperation existing for practically all of our public health programs.

If the utility and other corporations having contact with the home can be persuaded to have their representatives take part in the program, and this alone requires a considerable educational activity to achieve, it is the responsibility of the health department or the local safety council with which it coöperates to provide the necessary training of these men.

One special group which can play a very important part in a home safety program is the Association of Architects. Certainly, structural defects in the home account for a significant portion of home accidents. In New York State we have had the benefit of the services of a Subcommittee on Housing which is composed essentially of architects. This subcommittee has prepared a special brochure designed to bring architects up-to-date regarding techniques whereby safety features may be included in the planning of a house. At the present time, this subcommittee is coöperating with the Adult Education Division of the Syracuse City Department of Education in conducting a course in home remodeling open to the public without charge. Lectures and demonstrations are held one evening each week for six weeks. People usually remodel their homes from the viewpoint of beautifying them or making them more practicable, and it is the purpose of this subcommittee to add a third reason, namely, the elimination of any accident-predisposing features. The average attendance at this course is about 100 and the material prepared for it will be available for similar courses elsewhere.

2. EPIDEMIOLOGY

For a direct approach to the home accident problem in any community, it is necessary to have detailed information regarding the epidemiologic factors involved in the causation of accidents. Several worthy studies have been conducted and have brought out pertinent information regarding the environmental and personal items related to the accident problem. However, it is apparent that these factors may vary in different communites inasmuch as they are related to housing conditions, economic levels, literacy, facilities for medical care, liquor and drug control, age distribution, and very important the previous level of accident prevention activites in the area.

Here is a field in which the science of epidemiology first employed by health departments for acute communicable diseases and more recently for the chronic diseases, may be utilized. During the current year the State Depart-

ment of Health is organizing a demonstration program of this type in one region of the state. With the coöperation of the hospitals and physicians, an investigation will be made of each person hospitalized because of a home accident or possibly because of related accidents as well. A nurse will interview the patient or members of his family for the purpose of determining the nature of the accident and the underlying factors, and to get a history of previous accidents suffered by the patient. She will then visit the site of the accident to determine the physical features involved. The information will be made available to the attending physician who will be asked to determine the presence and correctibility of any mental or physical disorder leading toward accident-proneness. The important questions to be answered are: how could this accident have been prevented, and how may a repetition be avoided? As the study progresses, non-hospitalized cases may be included upon referral by the private physicans, or upon discovery by public health nurses or social workers during the course of visits for other purposes. At the present time the nurses in one section of the demonstration area are already making inquiries regarding all accidents occurring during the last 3 years among the members of the families they visit for any purpose whatsoever.

The information obtained from the study will serve several purposes. First, it will provide information regarding the general environmental factors responsible for accidents in this community and thus allow the educational program to be more specifically directed at the removal of such hazards. Second, it will determine the incidence of accidents attributable to special problems requiring outside assistance for their correction. The occurrence of many accidents due to structural defects may indicate changes in building regulations. If a large number of accidents have been found to be caused by a new type of washing machine or stove, the matter can be referred to the manufacturer with a request for an improvement in the structure of the item, or for a more satisfactory set of directions regarding its use. Third, the investigation will lead to the discovery and treatment of accident-prone persons, and will provide information regarding the relative importance of proneness in the home accident problem. Finally, continuation of the study for several years will lead to an evaluation of the effectiveness of the home safety activities of the communities through an analysis of the number and types of accidents admitted to hospitals or seen by physicians each year.

3. CASE FINDING AND TREATMENT

Case finding in the accident field refers, of course, to the discovery of persons who, because of mental or physical disorders, have an incidence of accidents beyond that suffered by the average person regardless of environmental conditions. The practising physician must be ready to recognize accident-proneness and predisposition and to institute procedures for the discovery of the cause and the elimination of the factors involved. The epidemiologic study referred to above is expected to demonstrate how careful investigation will lead to the discovery of accident-prone individuals. Public health nurses, social workers and teachers, if well informed regarding the nature of accident-proneness, are in an excellent position to detect individuals having an extraordinary number of accidents, and refer them for proper medical attention.

Children found to be accident-prone may be referred to child guidance clinics operated in New York by the Department of Mental Hygiene, where a complete psychiatric and psychologic investigation can be made to determine

the causative factors. This referral will, of course, be made after the child has had a complete physical examination to determine whether disturbances of vision, hearing, or neuromuscular coördination may have played an essential role. In the larger medical centers, an accident clinic may be warranted, and some institutions are experimenting with this type of procedure. Actually the accident clinic serves as a clearing center from which the patient is referred to various specialists in an effort to determine the factors responsible for his proneness. The establishment of such clinics upon an experimental basis is an excellent field for coöperation between the medical profession and the health department.

4. RESEARCH

The accident prevention field is one of the newer public health activities and will require much research before the ultimate in achievement has been reached. Research must include the exploration of improved methods of administering the safety program, and determination of the relative roles to be played by health department personnel, voluntary agency representatives, industrial concerns, and safety councils. The program looks for improved methods of encouraging the public to participate in the safety program and of making safe methods attracttve to the homemaker. It calls for exploration of procedures for obtaining additional data regarding the basic nature of the accident problem, discovering the accident-prone individual and rehabilitating him. Above all, there must be sought improved methods of evaluating our results in this field so that we may be certain that we are approaching the objective of reducing morbidity and mortality from home accidents.

5. CONSULTATION AND COÖPERATION WITH OTHER AGENCIES

While the health department should accept the lead in setting up the home accident prevention program at the state and local levels, it must encourage the active participation of other official and voluntary groups in the planning of the activities, the provision of educational materials, the training of personnel, and the actual extension of the program into the homes.

The local departments will find active coöperators among parent-teacher associations, men's service clubs, church groups, 4-H Clubs, Home and Farm Bureau groups, granges, Red Cross Chapters, boards of education, Boy and Girl Scouts, county medical societies, nursing associations, trade unions and many others. These organizations have much to offer in the way of educational outlets, home contacts, and provision of active workers. However, it is necessary to stimulate their interest, motivate them to play an active part in the program, train their workers, and make them feel that they are an important cog in the overall machine through active representation in the local council.

It is not at all times possible, nor even desirable to confine local programs to home safety. For example, child safety has great emotional appeal and was the subject of a national campaign during September. Children are all too frequently the sufferers from home accidents, but they also are involved in accidents outside the home. Thus, a child safety campaign requires coöperation by the health department with the many agencies concerned with other fields of safety.

All accidents, whether they occur on the highways, in places of public assembly, or in industrial plants, are of public health concern, and the health officer should serve as a consultant to all organizations interested in accident prevention.

SUMMARY

Home accidents comprise a significant public health problem and fall within

the domain of the health department. The health officer and his staff of public health nurses and sanitary engineers have frequent contact with the members of the home, and work closely with physicians, school authorities, and representatives of voluntary agencies, all of whom can render active assistance in a home safety program. The incidence of morbidity and mortality attributable to home accidents can be reduced by the application of the techniques of public health education, epidemiology, case finding, rehabilitation service, and research, all of which have been so well utilized by health departments in other public health fields. Home accident control must be incorporated as a regular function of the health department, closely integrated with the activities of many of the regularly operating bureaus, if further substantial reduction in disability and death rates is to be achieved.

Industrial Hygiene Advisory Committee

A national advisory committee to the Division of Industrial Hygiene, Public Health Service, on all phases of industrial hygiene has been appointed and is holding its first meeting late in September. The members will bring together the viewpoints of management, labor, the health professions, and state health and labor departments in broad policy guidance of the division, made necessary by the new importance of air pollution in industrial towns and cities and the increasing interest of labor unions in health and welfare plans.

Members of the committee are:

Vincent P. Ahearn, National Sand and Gravel Association

Nelson H. Cruikshank, American Federation of Labor

Andrew Fletcher, President, St. Joseph Lead Company

Theodore F. Hatch, Research Director of the Industrial Hygiene Foundation

R. H. Hutcheson, M.D., Tennessee State Commissioner of Public Health

Margaret Lucal, American Association of Industrial Nurses

Leo Price, M.D., Director, Union Health Center of the International Ladies Garment Workers Union

Harry Read, Congress of Industrial Organizations

Harold A. Vonachen, Medical Director, Caterpillar Tractor Company

Health Demonstrations in Two Minneapolis Schools*

HELEN M. STARR, PH.D.

Health Coördinator, Minneapolis Public Schools, Minneapolis, Minn.

IN the spring of 1947 we launched something quite new in Minneapolis in the way of health education—an overall health education demonstration for two selected schools, one on the elementary, and one on the secondary or junior high level.

In inaugurating these programs we had certain definite purposes in mind:

First of all—and this was our primary concern at both levels—we wanted to find out what the two schools really needed in health education, including health services, equipment, etc; healthful school living, both the physical and mental aspects; and what we could do to meet their needs.

We wanted to show curriculum directions in health education—what to teach and ways to teach health so that the development of basic understandings, skills, and attitudes in health could become a living part of each pupil's experience.

We wanted to develop techniques and procedures for getting needed health information about the school and community. What kinds of tests, what kinds of surveys and observation techniques can be used to supply these communities with data about the health needs of our pupils.

We wanted to demonstrate group action—people working in harmony for the common good of their school and community.

We wanted to introduce those health procedures recommended by educators, doctors, and public health authorities as basic to a successful school and community health education program.

We wanted to show the steps another school might follow in inaugurating a health program of its own.

We wanted to introduce a sound program of physical education and recreation in these schools.

The money to support the idea of the demonstration came from the Hennepin County Tuberculosis Association whose Christmas Seal money is spent, to a large extent, in health education and research. In the fall of 1946, in response to a request from Willard Goslin, then Superintendent of Minneapolis Schools, they offered a $10,000 grant to the Minneapolis schools if they would set up and staff some type of a health education program for a two year period. Five thousand dollars was to come the first year, the second $5,000 if the first year's work was satisfactory. The responsibility for setting up the program became the responsibility of the Minneapolis Board of Education.

The project was under the immediate supervision of Prudence Cutright, Assistant Superintendent in charge of Elementary Education and in charge of health

* Presented before a Joint Session of the American School Health Association and the Public Health Nursing, Public Health Education, Maternal and Child Health, and School Health Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

education in the schools, and the overall guidance of curriculum activities on the junior high school level became the responsibility of Dr. Robert Gilchrist, Assistant Superintendent in charge of Secondary Education.

Dr. Delbert Oberteuffer, Professor of Health and Physical Education at Ohio State University, was called in as general health consultant. Shortly after, I was excused from some of my university teaching to act as project director.

It was emphasized that we were not to become an experimental center, but rather a demonstration laboratory in which recommended procedures were introduced, developed, and evaluated. We planned a pilot study in health education for the Minneapolis schools. We took our schools and our health facilities just as we found them and simply extended their usefulness.

In the latter part of January, 1947, we had three days of preliminary meetings on planning and organizing. To give our work a firm foundation in the life and interests of the community, this early planning committee was chosen on a city-wide basis. We had representatives, not only from the school system, but from the Minneapolis Health Department, the University of Minnesota, the Hennepin County Tuberculosis Association, the Minneapolis Council of Parents and Teachers, the Minneapolis Council of Social Agencies, and other interested groups. With some additional personnel this group became our advisory committee to the project, which will function throughout the two year demonstration. One of the activities of this committee was the assistance with, and approval of, a list of elements which should be found in any successful health education program. Also, this committee has been looked upon as a guiding group for policy development in the field of school health education.

In February we sent out letters to all of our elementary and junior high schools, telling them about the proposed demonstrations and asking those who wished to become health centers to make a formal request by letter to the superintendent in charge of their particular level. In response we had a number of applications from the elementary and junior high schools. We chose our demonstration schools very carefully on the basis of 38 criteria. These included such diverse factors as location of the school, condition of the school building, availability of lunch room, health conditions as shown by city statistics, percentage of juvenile delinquency, interest of the staff, availability of community health services, and desire on the part of the school to be a demonstration center. At the end of a long screening process we selected Whittier and Franklin schools from our list of candidates. Interest of the staff was a major factor in the selection of these schools.

Whittier School, located on the south side of town, is a typical Minneapolis school. It was old and at that time in need of repairs, but it had space available for additional health activities and an alert and interested staff. There was an enrollment of 740 pupils and a staff of 21 classroom teachers. It is in an old section of town with old houses divided into smaller units and a large percentage of renters. Many of the families are from the average and lower income brackets but some are well-to-do. Whittier School is located within an area of high juvenile delinquency.

Franklin Junior High is on the other side of town, in north Minneapolis, in an old and highly industrialized section. Because many of the parents are foreign born and many of the mothers work in factories, we found it more difficult to make contact with the families. Here, too, we found a high rate of delinquency, both as to adjudicated and pick-up cases, and the tuberculosis death rate is higher than in any other area in town. Seventy-five per cent of the

pupils showed evidence of dental caries.

In both schools the program which was finally set up evolved directly out of the needs of that school. There was no set plan, program, or direction brought into the school by the director or anyone else concerned. It became the job of the particular school to develop its own program. However, opportunity for consultant services was extended to these schools by members of the advisory committee, the central office staff, and other interested groups.

All through the spring of 1947 there were preliminary meetings between staff, principals, director, parents, students, and consultants of the central office staff. They talked over health needs—needs to be met immediately and those that could wait awhile. At the same time teachers were reviewing studies and reports which contained objectives, content, findings, and recommendations for sound programs of school health education. Consultants and other specialists in this field were invited to the school to discuss program needs in their respective areas. This study of what should be included in a present-day school health program, paralleling the discovery of what a particular school was like in respect to these characteristics, made it possible to develop a meaningful list of needs as a basis for an immediate and long-range attack on setting up a total health program. This purposeful delay until the fall, in selecting a complete and polished list of general and specific objectives for the demonstration, gave us the opportunity in each school to get underway faster and to avoid, as much as possible, that terrible calamity of some educational projects—that of becoming bogged down with a philosophical attack on the development of a beautiful set of objectives which have finally become an end in themselves. However, by the fall of 1947 the objectives committee in each school presented to the staff and health council a list of general objectives for the demonstration. These were developed as a result of the spring study of needs and recommendations of studies in this field. Under each objective was a list of elements which would be in existence in the school, if and when the particular objectives were realized. From this list of elements and the various committee recommendations as studied by a small committee, a list of specific objectives was developed for the year. This list of specific objectives, as in the case of the general objectives, was selected and approved by both the staff and health council of each school. The year's work, then, in these schools was directed toward the realization of the specific objectives. This plan helped to keep us on the track and to make orderly progress toward our immediate goals. In a field as broad as this it is easy to lose one's way, to duplicate on some areas, or to omit others entirely. Therefore, it was important that each need or problem be studied in terms of the overall picture of the project.

The committee organization appeared to us to be the most efficient technique to provide the opportunity for participation of all concerned. Although a few teachers were pegged for certain jobs, such as the physical education teacher on the physical education committee, in general each one selected the committee of his or her choice. I should like to name the nine committees as they were set up in each of our schools, for they indicate the wide range of activities. There were committees on Objectives, on Health Instruction, on Individual Health Guidance, Mental Health, Physical Environment, Public Relations, Resources and Materials, Recreation and Physical Education, and Staff Needs and In-service Education. The last committee named was often referred to as a safety valve committee because the members kept their fingers on the pulse of the project as a whole. Were we moving too

fast? Too slow? Was everyone clear about plans? Were we acomplishing what we set out to do? What changes of action were needed? These were the types of questions we were forced to answer because every effort was directed toward the use of democratic procedures in the development of this program.

During the summer months additional meetings were held between director, principals, and advisory committee. Several of the teachers took special training at a workshop sponsored by the University of Minnesota and the Minneapolis Board of Education, and others attended workshops and schools in other parts of the country. Fall schedules were arranged so that each school was to have the doctor present one-half day per week, a social worker an additional one-half day a week, and a nurse an additional half day, in order to get the project under way. When school opened in the fall, all effort was directed toward work on our objectives for the year.

First of all, at Whittier and Franklin, we organized a health council, composed of teachers, parents, and student representatives. This was carried out on the recommendation for committee activities. It was felt that a need for a health council must exist. If a narrow concept of health is held by a school, a health council is like a sore thumb—always in the way—because the very existence of a health council should indicate a broad concept of health and a need for group action. In addition, we had a health committee, composed of boys and girls elected by their various home-room groups. At Franklin, we had student home-room representatives, who acted as leaders of their home-room group, and also helped us in our all important surveys. At Whittier, a pupil was elected from each classroom to serve on a school-wide health committee.

To relate and to coördinate the work of the small committees—the health council, school personnel, and parent organization—a steering or executive committee was formed in each school. On this committee we had the key individuals from the various areas, so that the entire project would be represented. For example, the health chairman of the P.T.A., the school doctor, principal, school social worker, the nurse, health coördinator, and I made up the regular membership of this committee. Others were called in as needs arose. At Franklin School the health coördinator is a teacher who has been released from two hours of teaching to coördinate the school health program. At Whittier School the principal is acting in the role of health coördinator for the present.

Our projects have been in operation something over one year. It is impossible in this report to make an adequate summary of the things that were accomplished by our two thriving centers. A few highlights, perhaps, will show you some of the things that were covered.

At Whittier, because it was an elementary school, many of the health activities centered on the teacher and in the classroom. Screening tests for vision were given, and all weighing and measuring was done by the teacher and made a subject of classroom discussion. The health examination, which was given to all fourth graders at Whittier, as well as to new students and referral cases, was made the subject for a teaching unit. Our friendly school doctor gave a demonstration of a health examination in each classroom, explained everything that he did, and answered any questions the children asked. At Whittier, this demonstration became the initiating activity of a unit on the health examination, while one of the culminating activities consisted of the pupil (1) making an appointment for a health examination, (2) completing, in so far as able, a health history, (3) inviting his parents to the examination, and (4) experiencing the examination and a plan

for securing needed corrections. In all of these experiences the pupils were guided by the nurse, teacher, and parent; yet, we kept in mind that the securing of corrections is a learning process on the part of the individual concerned.

The dental hygienist explained about the dental check-up and the how's and why's of dental care. The results of our food survey, also, were used in interesting classroom discussions.

At all stages of the health program, children were encouraged to ask questions, to make suggestions, to show initiative, and to assume responsibility. At Whittier, for example, the children actually took entire charge of our safety program. We had a lot of accidents at Whittier. Boys and girls were always getting hurt on the playground or, maybe, from hurrying too fast on the stairs. During the months of October and November one group of sixth grade pupils kept a daily record of the number and kinds of accidents occurring in the school and on the playground. Using the forms of the National Safety Council, they made an analysis and summary of the accidents.

Other sixth grade children became safety officers who supervised the playgrounds, enforced the safety rules devised by the student health committee, and taught the younger children how to play safely. Still others zoned the playground so that each grade had a special place to play during recess and the outdoor instructional period. As a result of this intensive program the children became extremely safety conscious and there was a drop in school accidents—from 66 to 21 per cent.

Just as in a business office, our entire program was expedited through the use of simple printed forms. One of these was called the "Teacher's Health Worksheet," and there was one for each child in the building. On it, the teacher recorded results of the health examination for each child as interpreted to her by the doctor and nurse, results of the hearing, speech, and vision tests, and information obtained from the school nurse, social worker, dental hygienist, as well as corrective work for any impairments found. This made a continuous up-to-date and permanent story of each child's health. Stress was placed on the making of a plan for correction and an attempt to carry out this plan. This technique also helped us view the child as a whole being. Often in health programs we take the child apart through our various health tests and, like Humpty-Dumpty, never put him together again.

In the elementary school, the classroom teacher became the key person in the referral and follow-up program. She was present at the health examination of each of her pupils and recorded the findings and recommendations of the doctor and nurse on the work sheet. On the secondary level, the home-room teacher attended a conference after the examination of each of her advisees, at which time the doctor discussed the results of the examination. If the findings of the examination warranted it, all of the teachers of a particular student were called in for the conference. This is leading to individualization of curriculum planning on the secondary level. Also, the doctor studies the work sheet and other information about each pupil before the examination so as to learn as much about the pupil as possible.

Children with health defects were, of course, referred to private physicians or to clinics and health agencies, and we checked closely to see that corrective measures were actually followed through. But many children, under par but without obvious defects, needed only such simple help as rest and food to build them up again. The P.T.A. equipped an empty classroom at Whittier with cots and bedding so that tired and over-active children could get an hour's rest, both

morning and afternoon if they needed it. These children were selected as a result of screening by the teacher and the nurse. The parents were informed about the rest program during school time and advised to carry out a similar program in the home. The rest program during the school day would be discontinued as the home care began to improve and results were evident in the pupils. These pupils were provided a hot lunch at noon, if necessary.

Over 100 pupils benefited from this type of special program. Careful records were kept of improvements noted. Teachers mentioned that certain pupils seemed to learn more easily, they were more relaxed, they looked better, behaved better in the classroom. Teachers valued this supervised rest period as a means of helping tired and undernourished children do better work in school. Teachers reported that teaching was more pleasant and more productive because of the better condition of the learner. A successful health program needs to be more than additional work for the teacher. It must show results by making teaching more satisfactory and effective with the group concerned.

A federal hot lunch program provided good meals at noon for the children whose mothers were employed through the middle of the day.

One of our committees, that on physical environment, greatly improved the housekeeping and the general set-up of the school. The seats in the classroom were of the old fashioned, screw-to-the-floor type, rigid and uncompromising. About half of these were replaced with movable, modern seating. The other half were released from the floor so they could be moved around to take advantage of lighting and the current teaching program. Even without new lighting fixtures the lighting was improved, through proper use of shades and different arrangement of seats.

By providing Whittier with a full-time physical education teacher, it was possible to give each child half an hour of physical education every day, once or twice a week with a special teacher and three times with his classroom teacher. In addition, we had a thriving after-school recreation program with clubs and games for every age group. Voluntary leadership was secured for this program.

We were fortunate at Whittier in having the services of mental hygiene nurses—girls from the university who specialize in psychiatric work. They come to our center, one at a time, to work for the period of a university quarter. Staff conferences have been held in all cases where special care seemed indicated, a program of play therapy has been put into operation, and teachers have been given excellent help in handling children with emotional problems. In both of our schools, teachers asked for assistance in helping the child with problems as their first need in inservice education.

Although the demonstration at Franklin was similar to that at Whittier, it departed in several important respects. We had to key our work to a different age level. Teen-age children recognize the value of good health and are beginning to take responsibility for their own welfare; and in the junior high we found that the home-room, where the student reports to the same teacher once each day, was the natural center for the health guidance program. To carry out this individual health guidance we had what we referred to as an extended home-room period each week. During this time, discussions and conferences were held regarding current health problems, an opportunity was provided for follow-up on dental work, surveys and tests were given, various health activities going on in the school were explained and discussed. Each home-room teacher had a record for each one of his or her advisees on the Health Worksheet.

Information received from the nurse, the doctor, results of hearing, dental, and vision screening tests were recorded on this record. This health picture of the pupil, with recommendations, gave the teacher valuable information to use in individual guidance. This individual guidance program was paralleled by a program of group health instruction for each grade.

At Franklin, one vital source of important health information was a three day General Mills nutrition survey like the one conducted at Whittier. Spot surveys were made at school on washing hands before lunch and wearing glasses by students who need them. One survey checked the home conditions of our 575 pupils—facts about house construction, lighting, heating, home ownership, etc. One survey asked parents what they thought the school should teach in health matters; another test quizzed pupils to find out what understanding they had about health; still another investigated sources of health knowledge. "Know Yourself," a test for spotting emotional troubles, was given by our counselor to all members of the seventh grade class. With the exception of the last test, the conduct of these surveys had the assistance of the members of the pupils' health committee.

We accomplished many other things at Franklin. After years of sooty neglect the school blossomed out in a new coat of paint (in so far as possible each teacher chose the color for her classroom), and the swimming pool was repaired. We started work on a north side dental clinic which will be ready this fall. The Minneapolis Council of Social Agencies took the leadership in securing this clinic as none existed on the north side for use by these pupils. I speak of individual items, but in the actual working of the project all the items were integrated into one smooth-running health demonstration.

In both of our schools we have conducted important inservice education for teachers. We have provided them with kits of practical materials for classroom teaching and built up extensive reference libraries on health. We have had numerous talks by professional health personnel. The teachers, throughout, have been given enthusiastic support.

The parents, too, have been coöperative. It was the mothers who set up and supervised the children's rest room. They have helped with surveys, with vision and hearing tests, served on councils and committees. They, too, have helped in the after-school recreation program—leading Scout and Brownies' troops, or coaching a volleyball game. Also, they have organized their P.T.A. and the adult education program around the "health theme."

The homes and communities in each district are kept informed about the school health program through the publication of a *Health News*. The writing of this news is a language project, but the pupil committees in each school decide upon its content and theme for the month.

Have the projects been worthwhile? The answer is definitely "yes." I could quote the results of statistics that would give proof of this; but the statistics should wait, I think, until the end of our two year project. At the end of only one year's work, however, our pupils have a more pleasant, more healthful environment in which to work and play. Their daily schedule is adjusted to their individual health needs. The whole curriculum is directed to the development of a well rounded, integrated, healthful personality. Teachers, parents, consultant, pupils, special health service personnel, community health representation are being given an opportunity to work together for an effective school health program.

Seattle's Public Health and Education Departments Coöperate in Organizing and Conducting a Food Handler's Training Program*

EMIL E. PALMQUIST, M.D., M.P.H., F.A.P.H.A., KENNETH WILLIAMS, AND FREDERICK F. ALDRIDGE, M.S.S.E., F.A.P.H.A.

Director of Public Health, Seattle-King County Department of Public Health; Coördinator, Distributive Education, Edison Technical School; and Director of the Division of Sanitation, Seattle-King County Department of Public Health, Seattle, Wash.

THE administration of Seattle's Training Program for food handlers is the joint undertaking of the Seattle Public Schools and the Seattle-King County Department of Public Health.

In the spring of 1947, it was concluded that the annual physical examination of food handlers was insufficient for the purposes for which it was intended. Yearly physical examinations were considered of little significance in protecting public health, especially if the prospective food handler was not familiar with the simple sanitation measures for preventing the spread of communicable diseases in food and drink establishments. It is possible for a food handler to contract a communicable disease shortly after such an examination and become dangerous not only to the public but to fellow workers as well. The local food and drink establishment ordinance gave the Health Department authority to determine whether or not a food handler was in any way dangerous or otherwise unsuitable as an employee in a food or drink establishment.

In order to fulfil our responsibility in connection with the food and drink establishments it was decided that all food and drink establishment workers should be familiar with the measures for preventing the spread of communicable diseases in such establishments. To accomplish this purpose the Health Department announced a new policy, effective February 1, 1948. The requirements for the annual food handler's permit are:

1. Satisfactory physical examination (routinely only a chest x-ray is required), which primarily serves as case finding for tuberculosis. About twice the average incidence rate of tuberculosis has been found among food handlers in our community.
2. Certificate of satisfactory attendance at an approved food handler's course in lieu of passing a written examination in sanitation procedures.

As early as 1945, food handlers' courses were sponsored by the Health Department and the Public Schools. In 1945 and 1946, a food handler's training program was made available to food establishments on a voluntary basis. A few of the larger establishments took advantage of the program but it soon became evident that the establishments and employees who were most in need of training did not participate in the program; consequently the objective was not reached and attendance lagged to the point where finally the courses were discontinued.

Beginning in the summer of 1947, the Health Department and the Seattle Public Schools had several meetings with a joint advisory committee comprising representatives from the Washington State Restaurant Association and from the Culinary Unions for the purpose of setting up a food handler's training program acceptable to all concerned. It was decided to tackle the problem on a compulsory basis through the issuance of food handlers' permits as indicated above. A legal ruling on the existing food and drink establishment ordinance indicated that the Health Department had no legal right to require attendance at a food handlers' class as a prerequisite to issuing food handler's permits but could require an examination on sanitation procedures to determine the fitness of a prospective food handler.

After several weeks of personal contacts with Culinary Union representatives in the Seattle-King County area, the advisory committee obtained support on the adoption of the new policy in connection with the issuance of food handlers' permits. Invaluable assistance in the early contacts was provided by the local Cooks' Union whose representative paved the way for personal interviews with officials of all of the Culinary Unions. It was pointed out to the union groups that a basic knowledge of disease prevention measures was essential on the part of their workers both for the protection of the workers themselves and the customers.

After several meetings of the joint advisory committee representing the Seattle Public Schools, the Department of Public Health, management and labor, a course outline was approved.

The Seattle Public Schools employed a former Vancouver, Wash., Clark County-City Health Department Sanitarian, William J. Dingle, to conduct the classes. Knowing the food handler's problems from firsthand experience, the instructor talks their language and keeps his lectures on a non-technical level. In fact, the classes were made so interesting that prospective pupils had to be asked to wait their turn which came when their present permits expired. (Permits are good a year from the date they are issued.) As food handlers come to the Health Department for their permits they are given a physical examination (chest x-ray) and assigned to food handlers' classes at the Seattle schools. Upon the completion of the course they are issued their permanent health card or permit which is good for a year from the date issued.

At the present time we are training approximately 24,000 food handlers a year in the Seattle area. This requires 1 full-time and 4 part-time instructors, all of whom are experienced sanitarians. The cost of instruction approximates the combined salaries of 2 full-time sanitarians. The program is financed through Vocational Education Funds of the Seattle Public Schools, derived from the Seattle Public School District, from the state government, and the federal government. The Seattle Public Schools finance approximately 35 per cent of the cost through local school district funds and receive the remaining 65 per cent from the Washington State Department of Public Instruction which makes funds available in accordance with the number of student hours and instruction hours provided. The Washington State Department of Public Instruction, in turn, receives approximately 15 per cent of the cost from funds made available by the George-Barden Act of the Congress of the United States. The George-Barden Act, the one which helps finance the Seattle program, as well as the Smith-Hughes Act, makes funds available to states for vocational education purposes, provided that qualified instructors are employed, the training is limited to persons engaged in the trade or vocation, and that the training is an essential part of the vocation itself. In brief, all voca-

tional funds are allotted for the purpose of increasing the skill and knowledge of persons employed in occupations or those in the preparatory stage. This program is in line with the objectives of vocational education, whereby assistance from additional funds is made possible.

The 24,000 food handlers have been broken down to six different types consisting of:

1. Restaurant workers, including cooks, waiters, waitresses, bus boys, and dishwashers
2. Bartenders and barmaids
3. Meat cutters, packing-house workers and sausage salesmen
4. Dairy and milk product workers
5. Bakery workers
6. Miscellaneous workers, including candy and cracker workers, grocery clerks, warehousemen, and truck drivers

With the exception of the miscellaneous and dairy groups which attend only one session, all are required to attend two 1½ hour classes on sanitation and safety procedures. It was felt that more benefit would be derived and more interest inspired if different courses were given for each class of work. For example, a meat cutter is not interested in how to wash glasses nor does a bartender care about meat market sanitation.

Briefly, the courses consist of an explanation of bacteriology and its significance to food sanitation, together with slides showing good and bad sanitation practices in local establishments. The restaurant workers, in addition, are also shown the U. S. Public Health Service and industry-produced sound film strips.

Six months after the course had been inaugurated, a spot check of 32 taverns by a State Liquor Board Inspector revealed that 16 were washing their glasses in the required manner. Bartenders in 14 of these 16 places had attended the food handlers' courses. Previously, the inspector explained that he would have been lucky to find 2 out of the 32 taverns that were washing glasses properly during a rush hour.

To date, the courses have been well received. The reactions from both labor and management have been favorable. The most common criticism has centered on the fact that bosses or managers are not required to take these courses unless they are food handlers. Therefore, in order to strengthen the City's Food Establishment Ordinance and also take care of this criticism, an amendment was passed in September, 1948. The amendment reads as follows:

"The health officer may require the manager or operator and any employee of a food establishment to take a written and/or oral examination in the public health aspects of food handling; and may also in addition to, or in lieu of, such written and/or oral examination, require them to attend a food handler's training course approved by the health officer. The owner of a food establishment shall designate and notify the health officer of the name of the manager or operator who is directly responsible for the sanitation measures in the establishment."

Separate courses for operators and managers were inaugurated in February, 1949.

It is planned to revise the regular courses each year in order to give new and additional information to those persons who attended the previous year. The field of instruction is of sufficient breadth and length to allow for new material, together with a review, to be given each year.

It is interesting to note that when the new amendment to the food ordinance came up for consideration there was no organized objection to compulsory attendance at a food handlers' class. It is gratifying to know that food and drink establishment workers and their unions endorsed the new requirements.

In conclusion, we would like to point out that the food handlers' training program in the Seattle-King County area under the joint sponsorship of the Department of Public Health and the Seattle Public Schools is proving successful. It was possible under this arrangement to provide over 80,000 student instruc-

tions hours in 1948 without appreciably affecting the overall expenditure budgets of the school system or the Health Department. The facilities and finances are available from federal, state and local funds. It is up to local public health and public school authorities to make use of available sources.

The joint program in the Seattle area is accomplishing a worth while purpose and is a source of pride to the public health and school officials.

Massachusetts Public Health Conference

About 600 persons attended the 3rd annual Massachusetts Public Health Conference in Amherst, Mass., June 15-17, 1949. The meetings opened with a discussion of "New Horizons for Public Health Personnel," led by William R. Willard, M.D., Margaret G. Arnstein, and Clarence I. Sterling. At another session Hugh R. Leavell, M.D., discussed the "Health Section of the Hoover Report." Vlado A. Getting, M.D., reviewed current state and federal health legislation; Ira V. Hiscock, Sc.D., reviewed the Boston survey in "Lessons to be Learned from the Greater Boston Community Health Survey," and the Governor spoke on "The State's Responsibility for the Public Health." At a panel on "New Interests in Public Health," mental health, diabetes, cancer, geriatrics, accident prevention, diet therapy, heart disease and dental health were discussed. C.-E. A. Winslow, Dr. P.H., summarized the conference with a round-up of the highlights of the various meetings.

The following officers for 1949–1950 of the Massachusetts Public Health Association were elected and took office at the annual banquet on June 16:

President: Mary E. Spencer, Ph.D.
First Vice-President: Leon A. Bradley, Ph.D.
Second Vice-President: Arthur D. Weston
Treasurer: Catharine Atwood
Secretary: Solomon L. Skvirsky, M.D.
Representative to APHA: Raymond S. Patterson, Ph.D.

Some Effects of Health Council Programs on Basic Health Education*

JOHN W. FERREE, M.D., F.A.P.H.A., AND
S. S. LIFSON, M.P.H., F.A.P.H.A.
American Heart Association, New York, N. Y.

As part of an editorial entitled "Hollering and Kicking," *The Medical Bulletin* of Indianapolis and Marion County, Indiana, expressed the sentiments of the medical profession in many areas. "Physicians," the author wrote, "here as elsewhere, have been critical of volunteer health agencies, the feeling being that the medical profession many times was not consulted in problems which were of rightful primary concern. Many times, however, when these little discussions were boiled down it was found that the fault rested with a lack of understanding between the health agency and the profession. They had no common meeting ground." That last sentence expresses the vital need which is propelling intelligent community groups into the formation of health councils.

The editorial ended with this admonishment: "In other words, the day has long passed when the profession could stand around and holler. Hollering is a swell exercise for the lungs but today—in 1948—you have to back it up with a little muscle and brainwork too. In still other words:

> "A horse can't pull while kicking
> This fact I merely mention
> And he can't kick while pulling
> Which is my chief contention."

This editorial is mentioned because it illustrates a concrete achievement of a local health council organization even at its very earliest stage of development. In the mind of at least one man involved in the organization of the health council in Indianapolis, the process had done two things: It had presented to him the picture of opportunity to his profession for more full participation in matters of interest to them and it had instilled a larger understanding of his profession's responsibility.

It is this aspect of the health council's health education value and influence that I would like to point out today.

From our experience in working with health councils and councils of social agencies, we have learned that the greatest problem in these community planning bodies is to develop an appreciation of the educational needs of the people of the community and to reach agreement as to how these needs can be met. We have found that most councils and health divisions have as their prime function the discovery of problems through surveys of needs and resources. The degree to which citizens have participated in these fact finding procedures has varied with the philosophy prevailing in each council. Action seems to have resulted from fact finding in proportion to the degree of participation by the rank and file of the community with the professional health workers.

* Presented before the Public Health Education Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

At the time of presentation the authors were on the staff of the National Health Council.

We think we see a definite trend on the part of health councils to broaden their base of representation so that more citizens of the community can participate. The main problem to be solved by councils which have thus broadened their representation is that of resolving the relationship of the professional worker to the so-called lay person. In this connection professional health workers have had to define their role. Most frequently they have found it is one of sharing experiences and knowledge rather than one of autocratic imposition of a predigested plan of action.

This approach has worked out very well in the fact finding stage. We have found however, that when it comes to the coöperative community planning phase, involving the contribution which each agency will make to the program, there has been a reluctance shown by the individual specialized health agency to see its contribution as one related to the overall community program. Special agencies very often do not realize that unless a broad foundation is laid their special interests cannot wholly be fulfilled.

There is at the present time, however, growing concern on the part of health agencies to discover the health education needs of the community, and to come to agreement as to a common approach and to the individual contribution that can be made by each.

For example, in Philadelphia five health agencies agreed last year on a common approach that might be made in helping to meet the health education needs of one area in that city. Through the health division of the Health and Welfare Council, these five agencies agreed to share their resources for a generalized program of health education and also agreed that contact be made in this area through one person acceptable to all five agencies. This made it possible for the services of these agencies to be made available to residents when those services best met the needs and interests of those residents. Such a program eliminates the need for separate and repeated approaches by each agency. The coördinating person chosen by all five, can draw on the services of each, without repeatedly setting the stage anew and confusing the public.

In the course of the health division's work in Philadelphia, it was found that there were many agencies in the city concerning themselves in some degree with health education. Yet there was no interchange between these groups and there seemed to be little understanding of health education purposes and methods. To remedy this situation, the health education committee held a 3 day laboratory for the personnel of some 50 agencies that were attempting health education.

Reports that have come in from Philadelphia show conclusively that this health education laboratory was not an isolated experience in the lives of the persons who attended. The health division has developed a continuing program which includes a coördinated approach in the forementioned area of Philadelphia. A Resource Study Subcommittee is well on the way to completing a health education resource manual. A Committee on Evaluation is working on a form for evaluation of health education programs.

Most of you know of council organizations that have made outstanding contributions to well coördinated health education programs. They have pooled resources of personnel, money, and other facilities, and have demonstrated the value of common planning.

These efforts are important guideposts to what can be accomplished. But the fact is that we cannot speak of the health council program influencing the health education of the public in any merely narrow sense. Far and beyond specific constructive undertakings, im-

portant as they are, is the broader educational influence of almost every aspect of a council program. For the very process of working together is an educational one. The processes involved in studying needs, agreeing on which of them are of paramount importance, mapping out plans of action, deciding on what contributions can be made best by which organizations, are educational processes in the highest sense.

Let us assume for a moment that you and your organization are prospective participants in health council affairs. *What are some of the educational factors* which will influence you? What are some of the things that the health council can do for those meeting within its framework? There will be the realization that your concerns and those with whom you meet are essentially similar and that you are all interested in doing better the tasks entrusted to you and your agency. You will have an unparalleled opportunity to become well acquainted with your colleagues in the field and the work they are trying to do. In the process of discussion, planning and doing, you will discover that others have problems very similar to yours and those of your organization. You begin to see the interlocking relationship of your program with that of others. And it may be that, with this realization, you lose some of your defensiveness with regard to your job and your agency. You see the relationship of what you are doing to the broad picture of community health need. *And* what *may* seem trivial but actually is not, you will find enjoyment in exploring mutual problems with others interested in the same goals.

This simple business of understanding cannot be overestimated. Valuable efforts in public health have failed all too many times just because there was not enough understanding of aims and objectives, reasons and methods; because of meaningless rivalries which could be adjusted; because there was no machinery for setting the facts before all that had a legitimate interest in them. "There was no common meeting ground." Consider the alienation of certain professional groups from the very valuable efforts of voluntary and official agencies in many instances just because they were not in on preliminary planning, did not understand the broad purposes of the program. A certain kind of health education which is the framework of all our efforts had not been done.

Sometimes, to get initial coöperative effort there has to be a strong rallying point for all concerned. One such strong common interest is the promotion of local health departments. The National Health Council is currently giving priority to this problem and has watched with interest some of the developments in connection with community efforts in this direction. In Minnesota, the State Health Department with the coöperation of the Woman's Auxiliary to the Medical Society of that state, undertook to bring the problem of future local health units to the people. This was done through a series of "Health Days" around the state. As a result of six such meetings held during spring and fall, four of the areas covered by these meetings have already organized health councils. These councils make it possible for all organizations and agencies interested in health to work toward the key objective of obtaining full-time health services. By coöperating for this common goal, the participants cannot but get the "feel" of working together harmoniously and can more readily continue further coöperative effort on other problems.

In one western community the citizens, after a study of their public health needs, came to the conclusion that they needed a standard milk ordinance. Much of the milk sold in their county was un-

pasteurized, and there were certain forces in the community that did not want such a law. These forces almost won out. Fortunately there was a county health council composed of all the organizations in the county concerned in any way with civic improvement. When, through their council, they learned what was preventing them from having pasteurized milk, they initiated a campaign of public education and got the ordinance passed. The health department in this county had worked for a standard milk ordinance for several years. It had gotten nowhere because the people in the county were not concerned, nor were they brought into the picture in any way. When county residents understood what was involved, they got behind the campaign for an ordinance and it became law. Health council action turned the tide.

Almost every council activity has potential educational factors reaching deep into the community. The health council engaged in making a survey of what the community really needs most and what it already has in the way of resources is carrying out a project which is both self-educational and community-educational. In the process of making a survey, individuals and agencies alike are learning new facts and rediscovering old ones of importance to their programs and the public they serve. In this process there is the additional factor of press and word-of-mouth publicity which stirs the thinking and reënforces the knowledge of the average citizen. If the approach is right, he will learn, perhaps for the first time, that there are health agencies in the community interested in helping him and his family, and that their chief preoccupation is not fund raising.

Certainly the participation of citizen groups in these health council processes has vast implications for more far-reaching health education of the public. The public needs to be in on decisions as to what its needs are and what intelligent action is required of it to attain and preserve personal and community health. By bringing the public into partnership with the professional worker, the health council affirms its faith in the ability of citizens within a community to work together for its own betterment.

The community health council offers a great opportunity for the professional public health worker and representatives of the consumer public to join together for improved public health. Sometimes we behave as if the public had no part in this business other than to allow us to spoon feed it with our ideas, our plans, our programs. The channeling of health education to the various "publics" or communities within the community will be easier of accomplishment as those publics and communities become involved in planning and acting with professional workers.

In a time of increasing complexity the health council way offers the many earnest public and voluntary agencies dealing with health some hope of reaching the public in united fashion. The public, as individuals and as members of a community, thus primed as to the things it must do, the measures it must work for, will be far more receptive to the educational messages, the fund-raising appeals, the frequent calls to action that agencies make.

The health council can strengthen the individual agencies by pointing out the local needs in special health fields—not as isolated problems but as part of the total picture of community needs. Rather than centering on the national emphases in a special appeal, the council can relate the appeal to the local situation.

Bailey B. Burritt, former executive director of the National Health Council, says in part in his "Eight Public Health Challenges" ". . . it has been

demonstrated that the health council is an indispensable tool for securing, through the development of citizen understanding and participation, maximum results in public health. The challenge now before the members of the national, state, and local health councils is the strengthening of the council movement as an effective means of rallying behind it those agencies and individuals thoughtfully interested in public health."

In conclusion: We have a way and a method open to us for winning concerted purposeful action in the health field. Health education, not only of the large public but also of the smaller nucleus of persons who must take the leadership is essential. Like the medical gentlemen addressed by the editorial cited above, we can no longer sit and complain of our public health agency problems. Hollering and kicking are good exercise but intelligent community effort, achieved through a common meeting ground such as a health council, will achieve far more concrete results.

Take a Test

The Merit System Service booth at the American Public Health Association annual meeting in Boston attracted considerable attention with its "TAKE A TEST" exhibit. This consisted of six short sample tests, designed to illustrate the type of service being offered by the Merit System Service and to show how public health information, experience, and judgment can be measured by objective examinations.

The exhibit was repeated at the Western Branch meeting of the American Public Health Association in Los Angeles, Calif., May 30 to June 1.

The results for the Boston meeting are available in an attractively bound report which contains copies of the six sample tests, an answer key, an analysis of the scores of the persons tested, and an analysis of the items themselves. The latter illustrates the method which is used to evaluate the effectiveness of individual questions. The report may be obtained by writing to the Merit System Service, American Public Health Association, 1790 Broadway, New York 19, N. Y. $1.00.

Health Problems in Industrialized Agriculture*

S. J. AXELROD, M.D., M.P.H., F.A.P.H.A.

School of Public Health, University of Michigan, Ann Arbor, Mich.

THE extent to which agriculture has become industrialized is seldom realized. Concentration of land ownership, the introduction of mechanization, specialization of crops, and readily available transportation are all serving to bring about an industrial revolution on the farm.

Since 1910, the proportion of farms of 500 acres and over has increased sharply. As a result, in 1940, only slightly more than 4 per cent of our 6 million farms accounted for almost half the nation's total farm acreage. While the mechanical cotton picker is perhaps the most dramatic application of technology, the ubiquitous tractor, the sugar beet loader, and the potato harvester are other evidences of the mechanization of agriculture.

These developments have converted an important segment of our agricultural economy to large-scale specialized crop production. With many types of specialized crops, there are sharp peaks of labor requirements. Most of this labor is furnished by the employment of local workers for pay and by the unpaid work of members of the farm family. If the farm crops of this country are to be harvested, however, it is necessary that of the total hired farm labor force of 4 million, some 600,000 workers leave their homes for periods varying from several weeks to 7 or 8 months to work in areas that have seasonal farm labor needs so high that sufficient workers cannot be recruited locally.

In the United States, there are 56 well defined major areas requiring such outside labor. These areas are located in 44 of the 48 states, and involve about 1,000 of our 3,070 counties. Workers and their families follow six major migratory patterns: The Atlantic coastal, the central, the Great Plains wheat, the Texas to the sugar beet areas, the Texas-New Mexico-Arizona cotton, and the Pacific coastal. It is likely that the number of seasonal migratory farm workers will increase, since mechanization is making it possible for the farm operator to plant and cultivate acreage that can be harvested only with the help of such workers.

Studies by the Public Health Service and the Department of Agriculture have revealed the tremendous burden of disease and disability carried by the migrants following the crops. In great measure the cause of this heavy toll of ill health is to be found in the poverty of these workers, the insanitary rural slums where most migrants make their homes, and their difficult working conditions. Public health and welfare medical services are especially meager in those areas where the concentration of migrants is often the heaviest—the 40 per cent of the counties without the services of full-time local health departments. Moreover, residence requirements and local settlement laws make it frequently impossible for migrants to receive even such public health and wel-

* Presented at a Joint Session of the Industrial Hygiene and Medical Care Sections of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 11, 1948.

fare medical services as are available to local residents.

The disadvantaged position in which the industrial farm worker finds himself regarding the protection of his health as a worker is illustrated by a consideration of workmen's compensation. Farm labor is certainly no less hazardous than other types of employment covered by compensation acts. Nonetheless, agricultural employment is excluded from obligatory coverage for protection against work-connected disability and the resulting costs of medical care. In 24 states voluntary coverage of farm workers is allowed but because commercial insurance rates for this type of coverage are relatively high, it is seldom carried. Eleven states specifically disallow workmen's compensation for farm workers, even on a voluntary basis. Seven states allow certain limited coverage with numerous qualifications. Only in 5 states is the farm worker specifically covered by legislation, and even in these states there are numerous limitations and escape clauses.

Occupational diseases of workers in industrialized agriculture can be reviewed only briefly at this time. As with workers in other industries, the farm worker suffers from industrial accidents, toxic exposures, and occupational dermatoses.

In 1946 as in previous years, data from all industrial groups show that the largest number of occupational deaths, 4,500, occurred in agriculture. Because of the large number of workers engaged in agriculture, the death rate of this group was not the highest among the major industries. It was, however, 74 per cent above the average and was exceeded only by the rates for mining and construction. Further, agriculture was the only one of the major industrial groups that had a higher death rate in 1946 than in the previous year.

An analysis of the causes of accidents in 1945 among 50,000 farm laborers under supervision by the U. S. Department of Agriculture revealed that farm machinery and the handling of tools were the major causes of farm accidents. The tractor, one of the most useful pieces of modern farm equipment, was found to be a prolific source of accidents. The mishandling of sugar beet topping knives, hoes, pitchforks, cane cutting knives, and other hand tools accounted for about a third of the work-connected injuries. For this group of 50,000 workers, it was estimated that 9 per cent of all cases of illness were due to accidental causes and 3.1 man-days per 1,000 man-days of employment were lost through injuries.

In the field of accident prevention, as in workmen's compensation, there may be seen the disparity in the organization of services available for the protection of the farm worker as compared with similar services in manufacturing. Industrial safety programs, while far from complete, have been increasingly applied to protect industrial workers from disease and injury. On the other hand, the paucity of such efforts on behalf of farm workers is striking.

In regard to toxic exposures, lead poisoning among workers in apple orchards has been called to the attention of industrial hygienists by the occurrence of several "epidemics." Methyl bromide used in processing figs has been reported as the cause of severe intoxication. Chemical fertilizers such as anhydrous ammonia may cause serious poisoning and pesticides used as plant sprays create a hazard to the farm worker either in the process of spraying or of harvesting.

A large number of newly developed organic chemicals has been introduced to farming. Many of them are exceedingly toxic and represent a potential hazard to agricultural workers. Thus, for example, there was recently reported the death of 1 agricultural worker and the serious illness of 5 others resulting

from overexposure to ethylene chlorhydrin, a chemical used in a process which causes seed potatoes to sprout rapidly.

Many of the specific irritants responsible for the occupational dermatoses seen in industrialized agriculture are known, and long lists of such substances have been published. For example, there have been described "corn rash," hop pickers' dermatitis, a dermatitis due to the handling of citrous fruits and carrot handlers' dermatitis, to mention only a few. Other skin disorders seen in agricultural workers such as the "muck sores" of the Florida Everglades are recognized locally. In passing, the high occurrence of cancer of the skin in the rural South which is of interest in exploring possible environmental and occupational factors in the etiology of this disease should be mentioned.

Unpublished reports of the U. S. Department of Agriculture's Office of Labor indicate that muscle strain of the lower back, legs, and shoulders was a relatively important cause of occupational disability among the farm workers under medical supervision by that agency. In view of the long hours of work in the fields and the severe muscular exertion of stoop labor, the occurrence of this type of disability is not unexpected. In this group of disorders, there has been described a tenosynovitis of the hands of cotton pickers, which occurs early in the picking season, as a specific occupational disease.

While it is true that our professional attention has been largely directed to occupational injuries and diseases among workers in industrialized agriculture, as with other industrial workers, these disabilities by no means constitute the bulk of the health problems of these many men, women and children. Studies of absenteeism among industrial workers, other than agricultural, have demonstrated that about 90 per cent of their disabilities are non-occupational in origin, and that for every day lost due to industrial diseases and accidents, 15 are lost as the result of ordinary day-to-day adult illnesses.

Comparable data for workers in industrialized agriculture are not available. The most adequate information relating to the non-occupational disability of farm workers—that from the U. S. Department of Agriculture's Office of Labor—reveals that there is a similar distribution of occupational and non-occupational disease. For the agricultural workers under medical supervision by that agency in the four year period 1943 to 1947 approximately 352,000 cases of illness received physicians' care. This represents an incidence of all illness of 1,086 cases per 1,000 workers per year. Over 50 per cent of these cases can be considered to be non-occupational in origin, if the unsatisfactory housing and insanitary environmental conditions so frequently associated with industrialized agriculture can be dissociated from the occupation itself. In terms of day-to-day illnesses requiring physicians' services, 98,000 of the 352,000 cases of illness, or about 28 per cent, were respiratory; 51,000, or about 14 per cent, digestive in origin, and 37,000, or about 11 per cent, infectious.

Recurring and frequent upper respiratory infections were found to be associated with the overcrowded, poorly heated, and poorly ventilated housing accommodations of many farm workers. Digestive disturbances, for the most part diarrheas, resulted in many instances from inadequate refrigeration and other poor food handling practices. In mass feeding the practice of making up sandwiches the previous night to be consumed in the field the following day, was the contributing cause of several large outbreaks of food poisoning.

Two-thirds of all infectious diseases were venereal in origin and, although

the control of venereal diseases among workers in urban industry has aroused considerable attention, effective measures have not been applied to industrialized agriculture. There are of course, a few notable exceptions such as the state-wide venereal disease program for migrant farm workers in New Jersey and the mass blood testing of farm workers in Idaho.

The relationship between economic and occupational status and tuberculosis rates has not been as sharply delineated for workers in industrialized agriculture as it has for other occupational groups. X-ray surveys of workers in areas where industrialized agriculture has reached its highest stage of development indicate, however, that x-ray evidence of tuberculosis is found about twice as frequently as among the general population.

Health problems of farm workers in industrialized agriculture must be viewed against the background of the far-reaching social and economic changes that have taken place. For these workers agriculture is no longer a "way of life" but a part of the industry of the nation. The occupational disabilities of agricultural workers require that industrial physicians, industrial hygiene and safety engineers extend the application of preventive medical technics to workers in the agricultural industry. I should like however, to emphasize the important role of *non*-occupational disease as a cause of disability among workers in industrialized agriculture. Indeed, if a satisfactory industrial hygiene for agricultural workers is to be achieved, efforts must be directed toward the provision of adequate medical services for all workers in industrialized agriculture. There is particular need for such services for seasonal migratory farm workers.

"Oscars" for Safety Films

The National Committee on Films for Safety recently announced its 1948 "Oscars" for films making outstanding contributions to safety.

The four motion pictures and two sound slide films, that received awards, together with their classification and producers are:

Motion Pictures

"Then It Happened"—general safety—Forest Service, U. S. Department of Agriculture

"The Safest Way"—traffic safety—Pennsylvania State College for the American Automobile Association

"This Way Out"—occupational division—American Airlines

"Driven to Kill"—for theater showing—Sound Masters Inc., for the American Transit Association

Slide Films

"Award to the Wise"—traffic safety—Paragon Pictures for the Zurich Insurance Companies

"Helping Hands—Electrical Hand Tools"—occupational division—Paragon Pictures for the Zurich Insurance Companies

In addition, honorable mention or special commendation was given to "Wheel Sense," "Falling Timber," "Ski Tips," "Saga of Sawdust Sam," "Let's Stop and Go Safely," and "Lifelines." Further information about these is available from the National Safety Council, 20 N. Wacker Drive, Chicago 6.

The National Committee on Films for Safety, sponsored by the National Safety Council, includes representatives from 20 national organizations with an interest in safety. H. E. Kleinschmidt, M.D., administrator of health services, North Atlantic Division of the American Red Cross, represents the American Public Health Association.

THE CHALLENGE OF CHILD CARE

WE have referred in an earlier issue [1] to the illuminating study of the Academy of Pediatrics on Child Health Services and Pediatrics Education. We are happy to present this month an analysis of some of the high points of this study by Dr. Bain and Dr. Stuart.

The study deals with many problems, with quality of service [2] and with pediatrics education, for example. The most striking feature of the report for the health administrator and health planner is, however, the startling quantitative deficiencies revealed.

It is somewhat of a shock to learn that nearly 22 children per 1,000 in one state were under medical care on a given day; while in another state the figure fell to less than 8 per 1,000. For dental care, the corresponding figure was over 7 per 1,000 in one state and less than 1 per 1,000 in another. It is disquieting to find that 61 per cent of hospital births occur in hospitals that have no newborn nursery for sick infants separate from facilities for well infants; and that 40 per cent of such births are in hospitals with no house staff. Even more directly challenging to the public health profession is the fact that only 6 per cent of the children under 5 years of age actually receive the essential protection of well child conference service. (More, no doubt receive health guidance from private physicians but, of those physicians caring for children only 25 per cent are pediatricians.)

These deplorable shortcomings are clearly and directly related to economic status. "The parents are unable to pay for services."

Look at the diagram reproduced by Bain and Stuart. Note that the eleven states in the lowest of four income groups have a 27 per cent higher infant mortality rate than the states in the highest income group; and that, in these less fortunate states, the infants receive less than half the medical care and less than a quarter of the home nursing visits provided in the more prosperous areas.

Is this not indeed a challenge to the public health profession, to the Congress, and to the people of the United States—as well as to the Academy of Pediatrics?

THE CAUSE WE SERVE

THE readers of this JOURNAL are experts in the field of public health; but they are also citizens. More than this, their professional tasks themselves are of such a nature as to stimulate serious thought in regard to the basis of the society in which they function. We are all, in a sense, public servants, whether employed by the government, by a voluntary agency, by a university. Our enthusiasm and devotion depend on a conviction that the city, the state or the nation which we serve is in itself worth saving and that its salvation is of vital importance for the future of the human race on this globe.

There is no doubt that the philosophy of Washington and Jefferson, of Lincoln and Wilson, and the two Roosevelts is challenged by a powerful and ruthless alien power. That power we are meeting, diplomatically, with firmness and patience and skill. On a military scale, we are preparing for all eventualities, if diplomacy should ultimately fail. We can face the physical might of the Soviet Union with calm and confidence.

There is, however, a more subtle danger, against which we must be on guard. In 1898, William Graham Sumner made a notable address on "The Conquest of the United States by Spain." What he feared was that our defeat of an imperialistic empire might lead us to adopt its imperialistic colonial policy and thus that, while winning the physical battle, we should be conquered by the ideology of the vanquished. The history of our dealings with Cuba and the Philippines has shown that Sumner's fears were unfounded. We must be watchful, however, lest unjustified panic should lead us to follow those Congressmen and columnists and radio commentators who desire to counter the military strength of Moscow by adopting the totalitarian and repressive ideology of the Kremlin.

In this connection Chancellor Robert M. Hutchins delivered a notable address on the 237th Convocation of the University of Chicago. He said, in part:

> We hear on every side that the American Way of Life is in danger. I think it is. I also think that many of those who talk the loudest about the dangers to the American Way of Life have no idea what it is and consequently no idea what the dangers are that it is in.
>
> You would suppose, to listen to these people, that the American Way of Life consisted in unanimous tribal self-adoration. Down with criticism; down with protests; down with unpopular opinions; down with independent thought. Yet the history and tradition of our country make it perfectly plain that the essence of the American Way of Life is its hospitality to criticism, protest, unpopular opinions, and independent thought. A few dates like 1620, 1776, and 1848 are enough to remind us of the motives and attitudes of our ancestors. The great American virtue was courage.
>
> We ought to be afraid of some things. We ought to be afraid of being stupid and unjust. We are told that we must be afraid of Russia, yet we are busily engaged in adopting the most stupid and unjust of the ideas prevalent in Russia, and we are doing so in the name of Americanism. The worst Russian ideas are the police state, the abolition of freedom of speech, thought, and association, and the notion that the individual exists for the state. These ideas are the basis of the cleavage between East and West.
>
> Yet every day in this country men and women are being deprived of their livelihood, or at least their reputation, by unsubstantiated charges. These charges are then treated as facts

in further charges against their relatives or associates. We do not throw people into jail because they are alleged to differ with the official dogma. We throw them out of work and do our best to create the impression that they are subversive and hence dangerous, not only to the state, but also to everybody who comes near them.

The result is that every public servant must try to remember every tea party his wife has gone to in the past ten years and endeavor to recall what representatives of which foreign powers she may have met on these occasions. A professor cannot take a position on any public question without looking into the background of everybody who may be taking the same position on the same question. If he finds that any person who is taking the same position on this question has been charged with taking an unpopular position on another question, the professor had better not take any position on this question, or he may be haled before some committee to explain himself.

Is this the American Way of Life? The great American word is freedom, and in particular, freedom of thought, speech, and assembly. Asserting the dignity of man, and of every man, America has proclaimed and protected the freedom to differ. Each man is supposed to think for himself. The sum of the thoughts of all is the wisdom of the community. Difference, disagreement, discussion decided by democratic processes are required to bring out the best in the citizens. America has grown strong on criticism. It would be quite as consistent with the American Way of Life to offer prizes for the most penetrating criticism of our country as it would be to offer prizes to those who have done the best job of advertising it.

The heart of Americanism is independent thought. The cloak-and-stiletto work that is now going on will not merely mean that many persons will suffer for acts that they did not commit, or for acts that were legal when committed, or for no acts at all. Far worse is the end result, which will be that critics, even of the mildest sort, will be frightened into silence. Stupidity and injustice will go unchallenged because no one will dare to speak against them.

To persecute people into conformity by the non-legal methods popular today is little better than doing it by purges and pogroms. The dreadful unanimity of tribal self-adoration was characteristic of the Nazi state. It is sedulously fostered in Russia. It is to the last degree un-American.

This is a sound and a vital message. As is frequently the case, Shakespeare said it in fewer words,

> "To thine own self be true
> And it must follow as the night, the day,
> Thou canst not then be
> false to any man."

IODIZED SALT

A BILL requiring all table salt (except "Kosher" salt and salt for medical and surgical purposes) to contain a specified amount of iodine, sufficient to prevent endemic goiter, was introduced in the 80th Congress, was considered by the Committee on Interstate Commerce of the House and died in committee last July, in part because of conflicting philosophies.

Opposition to the bill was expressed by the Salt Producers Association, by some of the canning and food processing industries, and by individual physicians claiming to represent clinical dermatology.

Scientific and medical opinion was, and is, unanimous as to the benefits to be had from the presence of the small amount of iodide in table salt necessary to protect persons at all ages against the deficit conditions of iodine inadequacy.

It was argued by some lawyers that the bill was unconstitutional in that it forced medication upon persons by law. Food processors called attention to the possibility that flavor and other qualities of foods might be injured by the iodine in salt and advised research to determine the facts. Several dermatologists in

their individual capacities expressed a fear that some of their patients with acne vulgaris would find it difficult to avoid irritation from such iodized salt.

Within the year, the fallacy of the claims of food processors has been proved by carefully controlled experiments at Ohio State University and elsewhere.

Official opinion of organized dermatology has been expressed as not in opposition to universal use of iodized table salt.

A new and simpler bill to require that all table salt contain the necessary minimum of iodide was prepared in collaboration with the U. S. Public Health Service, the Food and Drug Administration, the American Medical Association, and the American Public Health Association, but has not been introduced in the present Congress because of an understanding arrived at between the Salt Producers Association and the four organizations above mentioned at a meeting in New York City on February 10, 1949.

This suggestion was discussed at length by members of the Salt Producers Association at their meeting in Chicago, March 24, 1949, and all manufacturers of table salt who were present expressed themselves as favorable to such action.

The proposal is now to develop promptly, and to continue as long as may be necessary, a sustained nation-wide educational campaign to teach the retail grocer to sell iodized salt and the retail consumer to purchase only this quality of salt in the interest of personal and national health and the prevention of disease.

Educational matter will be prepared by members of the Committee on Endemic Goiter of the American Public Health Association. The full strength and influence of the wholesale and retail grocery trade will be utilized to teach people to choose health-giving salt and avoid the deficit salt so commonly bought at present, to look upon such iodized table salt as they look upon enriched flour or enriched margarine, and not as if it were a medicated salt.

It is believed that the trade habits of the housewife and grocer can be so changed that there will be, after a few years of such educational effort, little or no demand for other than iodized salt and it will not be necessary to require iodization of all salt, or ultimately to label it as if it were exceptional or a medicated salt. We might even become as intelligent in our preference for this protective, reinforced, fortified or complete salt as our farmers have become in using such iodized salt for their cattle.

In a democratic manner, of good omen, an understanding adjustment or compromise has been arrived at by two parties each of which has the public health at interest and both of whom have had long experience with and made large contributions to the prevention of endemic goiter in certain states by use of iodized salt educationally fostered.

If the hopes of the two groups are borne out by the event, legislation will not be required.

GARBAGE GRINDERS—A PUBLIC UTILITY

WE have discussed in these columns [1] the advantages of the kitchen garbage grinder and expressed the view that some day the garbage can would be considered as archaic a device as the sanitary privy. The installation of kitchen grinders has made progress; and housewives who have used this method of disposal have found it of enormous value in promoting the efficiency and the comfort of home life.

The cost of the equipment has, however, limited the utilization of this device. When grinders are installed in individual homes, there is, of course, no compensating saving in public garbage collection. Economy as well as amenity can only be attained when the use of grinders is universal. In such a situation, the amortization and upkeep of household grinders (and the slightly increased cost of sewage treatment) would in most communities be a fraction of the cost of garbage collection and disposal—as conducted at present.

The attainment of this highly desirable end has now been made possible in one state through the passage of Act No. 147, Chapter 87 of the Laws of 1949, of the State of Indiana.[2] This Act gives each city or town (which has an adequate sewage disposal plant) the right to "acquire, own, operate and maintain . . . a garbage disposal system consisting of garbage grinders to be installed in private residences, business places or other buildings." Power is given to issue Revenue Bonds to pay costs of purchase, installation and upkeep in all houses or other buildings whose owners desire such service and to set just and equitable charges to be paid by the users of the equipment; and the community may then discontinue garbage collection and garbage disposal by other methods.

This is a courageous and imaginative step in adopting municipal legal practice to advance in scientific sanitation. Its actual operation should be watched with keen interest by health authorities in other states.

Clearing House on Public Health Salary Information and Recruitment

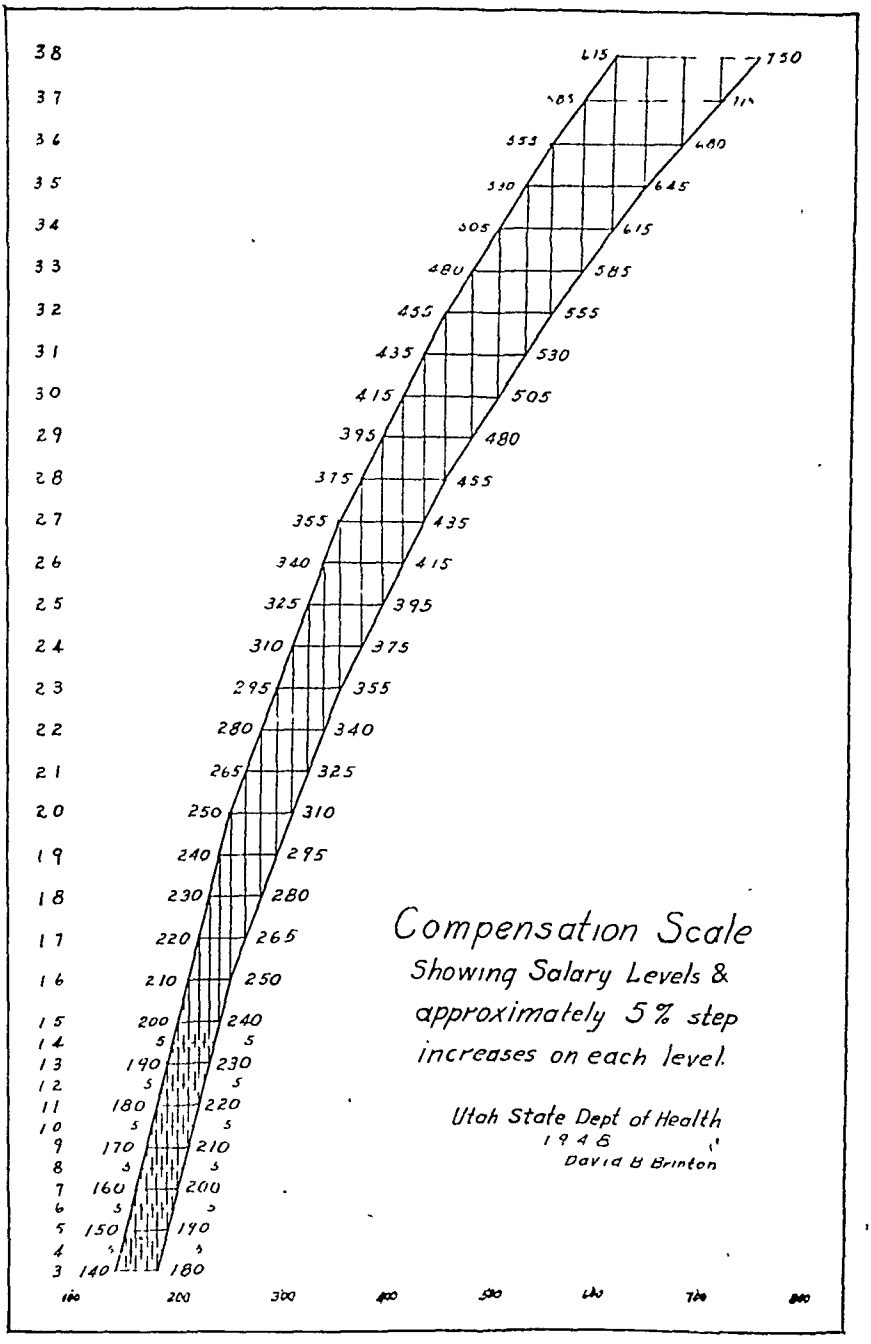
IT PAYS TO ADVERTISE—THEY SAY

Look Magazine for June 7, describes what it calls the "new-style nurse recruiting program" for the North Carolina Good Health Association and the State Nurses' Association in coöperation with several other agencies. The basis of the program is an annual "Miss North Carolina Student Nurse" contest. With all the fanfare of a beauty contest, a free trip to Bermuda for the winner with a wardrobe donated by local merchants, high school girls who had never thought of nursing begin to consider its glamours. The 1947 result—the 1,000 student nurses needed, plus 100 for good measure. The article says "Health authorities believe the method is unique, but would be happy to see the other 47 states follow suit and develop the contest into a national promotion for a 'Miss U. S. Student Nurse.'" Any takers?

PICTURE OF UTAH'S PAY PLAN

The attached chart is a schematic presentation of a proposed compensation plan for the Utah State Health Department. It shows proposed salary scales for 38 grades of positions, ranging from a low of $1,560–$1,920 to $7,380–$9,000 annually. It provides for progression from minimum to maximum in 4 step increases of about 5 per cent each. It does not provide for a graded plan of meritorious pay increments, however, as recommended by the A.P.H.A.'s Subcommittee on Salary Study.

This plan was prepared by the Department's Personnel Officer, David B Brinton, who has since resigned to enter another business. His discussion of the plan and its rationale follows:



Good personnel administration requires a thorough knowledge and a careful analysis of a long list of job factors and working conditions. From the point of view of most employees, however, the prime consideration is salary, of which the number of dollars per pay period is only the beginning.

The salary level for a position determines in part the group of individuals who will apply. Those who are not well qualified will, in general, not even examine the specifications of a job having a salary well beyond their accustomed range; the reverse is true for the highly trained. The intricate relationships of training, experience, responsibility, etc., of the classification specification must be evaluated and reflected with a fine degree of accuracy in the compensation plan. The ever increasing technical competence needed for most public or civil service positions requires that qualifications be constantly reviewed and kept current. Raising qualifications, however, is difficult in the face of an inadequate or inconsistent compensation plan.

The attached compensation scale is proposed as a means of attaining uniformity and consistency among the various levels and the five consecutive steps in each level. The steps provide approximately 5 per cent increments at each step increase over the entire scale. The importance of treating all employees alike financially, regardless of the salary level, cannot be emphasized too strongly or too frequently in a discussion of the basic principles of personnel management.

In the operation of the plan, each classification is assigned to its appropriate level on the compensation scale. The plan then provides a minimum and a maximum and three intervening steps for each level. If it is desirable to have more than five steps, the line on the chart representing the maximum can be moved to the right; thus enlarging it to a six step plan without jeopardizing its consistency and uniformity.

The plan is designed to cover the full range of merit system or civil service positions that are likely to be found in governmental agencies below the federal level.

Credit Lines

WINGS FOR LABORATORY SAMPLES IN NEW MEXICO

Jefferson stated: "the legitimate object of government is to do for a community of people whatever they need to have done but cannot do at all, or cannot do as well, for themselves in their separate and individual capacities." The public health laboratory of the New Mexico State Health Department, whose Director is Myrtle Greenfield, has recognized this truth. In coöperation with her colleagues, particularly the division of sanitary engineering, she has taken advantage of the fact that sparsely populated New Mexico is now well covered with air lines, to organize an air transport service for laboratory samples. Heretofore, the population in towns and cities was not large enough to support either district or branch state laboratories; nor was adequate transportation available for getting such samples to the central State Public Health Laboratory in Albuquerque.

District health officers and sanitarians now have such laboratory aids in their basic sanitation programs as standard plate counts, direct Breed counts, and phosphatase tests on milk samples, and swab counts on restaurant utensils. The major milk sheds of the state may submit milk samples, and restaurants in the larger towns may submit restaurant utensil samples to the Central Laboratory by commercial air lines at small expense. Samples are cooled when collected and packed in insulated containers with dry ice and carried as air freight at an average cost of less than $2 for 10 pounds. Even though some samples are shipped 300 miles, all reach the laboratory in less than 3 hours, while many arrive in less than 1 hour.

The field work is organized by personnel from the division of sanitary engineering through personal conferences and demonstrations. Frequently the organization for air flight transportation is preceded by stationing the Mobile Laboratory Unit in the area until the health officer, sanitarians, dairy operators, and restaurant owners learn the value of laboratory aid in the basic sanitation program.

Although this air service has been organized less than a year, it has already proved of great value and is an example of giving service to the public and of using available facilities to overcome great difficulties economically.

FOLLOWING A SURVEY

Readers of the *Journal* will remember that a study of Pennsylvania's public health situation has recently been made by the A.P.H.A.'s Committee on Administrative Practice at the request of the Governor and the Secretary of Health. (*A.J.P.H.* 38, 5:754, 1948; 39, 7:959, 1949.) Shortly after the study was submitted to the Governor, the Board of Directors of Public Charities Association of Pennsylvania instructed its public health division to proceed toward forming "a state-wide citizen's organization for improved public health services for Pennsylvania." It announced the survey would be the blueprint for the activities of this group.

As reported by the *P.C.A. Herald,* the board agreed that key requirements in Pennsylvania's public health are:

1. Improvement of state administration of health services.
2. Coördination of state, local public, and private health programs.

The health division was charged with working closely with other agencies, groups and laymen toward:

Improvement of administration of existing local health services.

Improvement of administration of those health services usually the responsibility of the state government.

Establishment of efficient and effective local health units.

Expansion of professional training facilities.

Coördination of hospital and health services.

Exploration of patterns for provision of medical care to greater proportions of the population.

This is an illustration of the kind of action that must follow a survey if it is to be more than an exercise in technique. The Pennsylvania Survey, like others, will bear fruit only to the extent that citizens make a reality of the recommendations that flow out of the findings.

CHILDREN WILL CHEW WINDOW SILLS

The Baltimore Health Department has been studying lead poisoning in children. Since 1930 it found 213 known cases of preventable lead poisoning, 76 of them fatal, in young children in Baltimore. But in 1948 there were 31 cases, more than in any previous year. The Health Department investigated; it found the 1948 cases, predominantly in the poorer economic sections of the city, resulted chiefly from chewing painted surfaces such as window sills or eating dried paint flakes cracked or chipped from indoor painted surfaces. In all but three instances laboratory tests of the chewed surfaces or paint chips proved the presence of lead. Indoor painting had been done with outdoor paint.

The department then distributed widely six suggestions for parents urging them to prevent small children from chewing painted surfaces and from eating dried paint flakes, using only lead-free paint for painting toys and indoor surfaces, and indicating the signs of lead poisoning.

It is another illustration of the many byways into which the public health worker finds himself in the pursuit of community health. What young public health student would have thought window sills were his province!

NEW MICROBIOLOGY INSTITUTE

Rutgers University, New Brunswick, N. J., is to have a $1,000,000 Institute of Microbiology directed by Dr. Selman A. Waksman. It will be financed by streptomycin royalties donated by Dr. Waksman. Thus streptomycin, like the widow's cruse of oil, will go on and on providing research provender. In 1948 Dr. Waksman shared an A.P.H.A. Lasker Award with Dr. Rene J. Dubos for studies on the microörganisms of the soil leading to the discovery of streptomycin and a host of other antibiotics. In 1947 he received the Passano Foundation Award of $5,000 for his original research in the field of antibiotics.

JOINT CANCER CONTROL PROGRAMS

In what the Canadian Department of National Health and Welfare calls "a move unprecedented in peacetime," federal health agencies of Canada and the United States are jointly sponsoring a campaign to tell their people the story of cancer research. The keystone of the campaign is a film tentatively entitled "The Scientist vs. Cancer," being made by the Canadian National Film Board, which will be distributed by the Public Health Service in the United States and by the Department of National Health and Welfare in Canada. Supplementary informational materials, ranging from study guides for teachers and discussion leaders, to booklets for students and lay groups will be produced by both sponsoring agencies. Among the purposes of the campaign is the stimulation in high school and college students of interest in cancer research, a field which like many others in science, suffers a shortage of qualified personnel.

Another instance of English speaking nations' coöperation in the cancer field is the exchange fellowships in cancer research offered by the American Cancer Society and the British Empire Cancer Campaign to British and American scientists for study in the United States and Great Britain respectively. (American Cancer Society, 47 Beaver St., New York, for details.)

Perhaps too, these activities will have another valuable by-product in expanding the areas of fruitful international coöperation.

"TIME" SUMMARIZES CANCER RESEARCH

Time, a weekly news magazine, gives some pages of each issue to medicine. The June 27, 1948, issue was devoted to cancer, with particular reference to Memorial Hospital and the Sloan-Kettering Institute in New York, headed by Cornelius P. Rhoads, M.D. It is a succinct summary, in remarkably understandable lay and colorful language, of cancer studies in progress and some of the hopeful outlooks. It is a good illustration of confiding in the public even on a highly technical problem about which no final solution has been achieved. Dr. Rhoads knows "that neither he nor his men nor anyone else in the world has yet found a cure for cancer," but, "it needn't be, not always."

BELATED MENTION

Lost in the overflowing basket of the Credit Lines editors for some time is *The Light on Tb in Arizona*, a two page leaflet put out jointly last fall by the Arizona Tuberculosis and Health Association and the State Health Department. It concentrates on, What Arizona Needs, and What You Can Do. It is significant that among the needs is a properly staffed public health unit for every county. It combines facts and motivation in an imaginative way and might serve to stimulate ideas for others with similar problems of getting a message across. Arizona Tuberculosis and Health Association, 623 N. 2nd St., Phoenix.

IN WORDS OF ONE SYLLABLE

Random signs indicate that public health workers sometimes abandon their "lingo" for basic English. *Stamford's Health*, the monthly organ of the Stamford (Conn.), City Health Department furnishes a recent illustration. In two pages it tells why Stamford needs a health center and how to get one. If you want to persuade your voters and taxpayers of the need for better housing facilities, this is a good illustration of how to give them the facts. Paul H. Brown, M.D., is the Health Commissioner.

HEALTH PROGRAMS OF UNIONS

The growth of trade union health and welfare plans gives point to a recent conference on union health programs conducted by the University of Illinois Institute of Labor and Industrial Relations (Urbana), and the Department of Social Welfare Administration in coöperation with the School of Medicine. Planned in response to a need voiced by organized labor, it was designed to "provide general information on voluntary prepayment medical plans." Proceedings are available from the institute. Especially valuable is an appendix including, among other items, a list of definitions, a list of unions including welfare plans in contract negotiations, and an analysis of state laws on voluntary medical and hospital plans.

Also published by the institute as a University of Illinois bulletin is *Health Progress in Collective Bargaining*, which is available from the Office of Publication, 358 Administration Building, Urbana.

INDUSTRY ADVERTISES CHEST X-RAYS

The makers of Gulistan carpets in Freehold, N. J., recently began, as ad-

vertisements in the local *Freehold Transcript,* "a series of informal discussions with our neighbors." They started the series with "It's time off—for sticking out our chests!" in which were given the facts about the coming annual mass x-ray survey. Everybody was urged to stick out his chest. The ad was illustrated with an effective line drawing. Credit Lines is indebted to Ralph Fisher, state consultant on community organization, of the New Jersey State Health Department for story and picture of this ad.

CANCER THE KILLER: IN A COMIC THRILLER

Cancer The Killer is distinctly in the comic book style—colorful, even gory pictures show the history of cancer diagnosis and treatment. To the comic book addict, this short publication ought to be a thriller. Illinois Department of Public Health, Springfield.

WORTH ACQUIRING

Roddy the Rat is the story of all the ways in which rats can carry disease as well as the way homes and other buildings can be ratproofed. It is written on the upper elementary grade school level, has good illustrations, and is particularly notable for explaining the reasons for things. An appendix includes descriptions of various types of rat control programs and instructions for the use of various poisons. Its slogan is Build Them Out; Starve Them Out; Kill Them Off.

Pineville High Meets the Challenge is the same kind of a story about hookworms and, like the bulletin above, was prepared with the coöperation of the Florida State Health Department. It exploits boys' interest in being a member of a winning football team to arouse initial interest in the hookworm and its devious path of infection.

Both pamphlets are available from Project in Applied Economics, University of Florida, Gainesville, Fla., *15 cents each,* 20 per cent discount on orders of 25 or more.

Nutrition for You has just been issued in a third edition, the first two having gone through four printings and 50,000 short of a million copies. Prepared by Walter Wilkins, M.D., Director of Nutrition Investigations and Services of the Florida State Health Department, and French Boyd, it is a set of food lessons designed to help each person to study and better his food habits. Prices furnished on request, Box 210, Jacksonville, Fla.

With this Dr. Wilkins sends also *Alaska's Health* of October, 1948, giving the result of the Alaska Nutrition Survey, and Mineral Composition of Florida Grown Vegatables, a 1947 *Bulletin of the University of Florida Agricultural Experiment Station,* of both of which "a few additional copies are available without cost."

Butch Looks to You is the second of the "Butch" safety pamphlets issued by the U. S. Department of Labor. Intended for shop foremen and supervisors, it outlines their responsibility for safety, not merely the technical details of guarding machines, keeping work spaces cleared, and other plant housekeeping, but the more elusive art of knowing what makes each person click, what are his emotional hazards, etc. Written in simple language and illustrated. U. S. Gov. Ptg. Office, Washington 25, D. C., *10 cents.*

ANNUAL REPORTS

The 8 year old Nutrition Foundation recently published its *1948 Annual Report* which summarizes not only its status and grants-in-aid, but is a summary as well of current trends in nutrition research. In the 6 years ending June 30, 1948, the foundation made grants of more than a million and a half

dollars in behalf of nutrition research. Of this amount nearly one-fourth was devoted to public health problems in nutrition and an eighth to education and professional training. The list of published research papers arising out of the grants is in itself a current bibliography on nutrition.

The foundation is supported by a group of food industries. Its scientific director is Charles Glen King. Its offices are in the Chrysler Building, New York City.

Rensselaer County (N. Y.), the first New York County to organize an overall county health department under the state's 1946 law providing additional state aid to county health departments, has published its first annual report, *Health in Rensselaer County*. For those who are still hesitating whether to organize a county or district health unit, perhaps its most significant sentence is "The success of the Department has demonstrated the value of performing direct health services through a well organized efficient local health unit covering a population group large enough to make the employment of well trained personnel economically feasible."

INDUSTRY IN PUBLIC HEALTH

An increasing interest in public health is being shown by industry as indicated by publication of periodicals. The latest to come to the attention of this department is the mimeographed monthly *The Conveyor* published by the National Canners Association Research Laboratories, Western Branch, San Francisco 5. Industrial sanitation and safety is its theme.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted.

Studies in Air Hygiene—*By R. B. Bourdillon, O. M. Lidwell and J. E. Lovelock, with W. C. Cawston, L. Colebrook, F. P. Ellis, M. van den Ende, R. E. Glover, A. M. MacFarlan, A. A. Miles, W. F. Raymond, E. Schuster and J. C. Thomas. Medical Research Council, Special Report Series No. 262. London: His Majesty's Stationery Office,* 1948, 356 pp. 7s 6d.

This volume is a technical symposium presenting in detail the extensive studies on air hygiene conducted in Great Britain through the later war years by a research team under the auspices of the Medical Research Council. The major emphasis has been directed toward the development and evaluation of quantitative methods for studying the properties of aerial disinfectants and for making basic observations on bacterial contamination in a wide variety of occupied spaces. A limited number of animal studies are also included.

The slit sampler has been shown to be a practical and versatile instrument for counting bacterial particles in air. It has the great asset over other sampling devices of measuring the rapid and often extreme fluctuations in aerial contamination that occur in occupied spaces. Furthermore, the rate of decline in bacterial counts following the introduction of disinfectants can be determined with accuracy in short time intervals. This instrument has not received the attention in the United States that it deserves.

The use of the logarithmic decay constant as the expression for the rate of removal of bacteria from air has been adopted as a standard procedure. This rate, as Wells originally pointed out, can be expressed in the terms of equivalent air changes per hour. Since the constants for measuring removal of bacteria by ventilation or sedimentation and killing by disinfectants are additive, a quantitative measure of the three effects is possible.

The capacity of a wide variety of chemicals, ultra-violet radiation, heat and filtration in killing or removing air-borne bacteria have been measured and the limiting conditions of their usefulness have been studied. There is no dearth of bactericidal agents, but many practical problems must be solved before large scale applications are feasible.

Extensive field observations of bacterial contamination of the air were conducted in operating rooms, homes, factories, air-raid shelters, and war ships under active service conditions. The relation of bacterial counts to the degree of human activity has been described in detail. The problem of achieving a substantial reduction in air-borne bacteria in the face of constant introduction of new bacteria has been clearly presented.

This report represents a major landmark in the development and application of quantitative methods in air hygiene. While the main body of the work will be of primary interest to students and research workers in the field, the final section presents a clear and succinct summary of the problem that will be of general interest to all workers in public health.

ALEXANDER D. LANGMUIR

Mineral Nutrition of Plants and Animals—*By Frank A. Gilbert. Norman, Okla.: University of Oklahoma Press,* 1948. 131 pp. Price, $2.75.

This book reviews the more impor-

tant papers in the literature dealing with mineral nutrition of plants at a level which makes it interesting and useful both to those who would like to be generally informed in the field and to those who might like a starting place from which to delve deeper into the subject. The book is of interest also to those who are concerned about soil conservation and its far-reaching economic effects, for the author gives some attention to this aspect of the subject too.

The book presents what is known concerning mineral requirements for plants and animals. It describes what happens to plants when the soil in which they are grown is deficient in minerals and, in turn, what happens to animals when they are raised on such plants.

The importance of more attention to the mineral content of soil is well established. While further knowledge is accumulating it is also important to apply the knowledge we now have to useful purposes. This book should be helpful in stimulating such action.

A bibliography of over three hundred references is included.

OTTO A. BESSEY

The Unexpected Gift—*By Dorothy Stephens Laird. Illustrated by Harrison Covington. University of Florida Project in Applied Economics, College of Education, Gainesville,* 1948. Price, $0.35 single copy, 20% discount for 25 or more copies.

This booklet is one of a series of science readers for the junior high school pupils. The material—presented in story form with nine pen and ink illustrations—should stimulate interest of pupils in an adequate diet and call attention to the role of the lunchroom in providing good nutrition as a part of the total school program.

The philosophy regarding the lunchroom program and the choice of nutrition teaching material is excellent. To present all of this in story form is an almost impossible task, and there are certain places where basic information is obviously tacked on to the framework of the story, but the earnest reader is rewarded by the realization that all essential information does get presented before the climax of the story is reached.

There is a story, complete with a pet dog, a wild cat, a barbecue, and a hero. It would be interesting to know how this presentation of rural Florida life would be received in New Mexico, where there are no swamps and alligators, but as an example of local material developed by collaboration of many interested persons, the book could well serve as an example for emulation by any state desiring truly local teaching material.

The type is clear. There is much conversation to add to interest and readability. It should prove interesting, usable, and instructive for children of junior high school age, and should help teachers who are attempting to serve their communities by teaching basic facts concerning food and nutrition.

MARGARET C. MOORE

American Standard Plumbing Code. *Sponsors: American Public Health Association and American Society of Mechanical Engineers. New York: Published by American Society of Mechanical Engineers,* 1949. 77 pp.

The A.S.M.E. has published *The American Standard Plumbing Code, A 40.7–1949,* representing the work of a committee formed in 1928.

The organizations, their subcommittees, and consultants from industry and government are to be commended. Many cities and states need guidance when they come to consider plumbing regulations.

The committee recognized that plumbing is not a static subject by appointing a Standing Committee to consider the results of present and future research on controversial plumbing subjects.

The Standards include the most complete coverage of the methods of protecting water distribution systems against backflow and back-siphonage of any recommended code thus far developed.

Despite the efforts of the committee to define loosely used terms, there are some ambiguities which may cause a problem in enforcement. The reviewer believes that a national code should have clearly stated in the text a statement of the basic principles governing plumbing. This point is not adequately covered.

The reviewer raises the question as to why a 3" stack was limited to a capacity of two bathrooms, when six bathrooms have been safely discharged (with proper revents) to a 3" stack for the past fifteen years. Economy of installation is the last consideration in health and safety, but it should not be disregarded when it also can be accomplished.

Any community adopting this code will have sound regulations not as restrictive and costly as some, and if any errors have been made they are on the side of safety and sanitation.

L. GLEN SHIELDS

American Foundations and Their Fields VI—*Edited by Wilmer Shields Rich and Neva R. Deardorff, Ph.D. New York: Raymond Rich Associates,* 1948, 265 pp. Price, $6.00.

This volume in its various editions may properly be regarded as the standard reference series on American foundations, dating back, as it does, to 1931 when the series began under the auspices of the 20th Century Fund.

The report points out that the number of true foundations has markedly increased from less than 200 a decade ago to more than 800 today. The present volume deals with 889 foundations which are divided into five groups, namely, grant-making foundations, community trusts, foundations granting fellowships and awards, operating foundations, and finally, foundations releasing little or no information.

This volume represents an indispensable aid for persons who have dealings with foundations. The authors and Raymond Rich Associates are to be congratulated on the thoroughness of the job and the format.

Again it should be said that the privilege of tax exemption which is afforded these foundations demands that they give financial and program accounting to the public. This report highlights the fact that about half the foundations still are secretive about this information.

REGINALD M. ATWATER

Film and Education—*A Symposium on the Role of the Film in the Field of Education—Edited by Godfrey M. Elliott. New York: Philosophical Library,* 1948. 575 pp. Price, $7.50.

It has taken many years for educators to change their attitude toward motion pictures and accept the film as an educational aid. In fact, full acceptance did not come until after World War II and the government's demonstration of the great value and possibilities of the training film.

This volume with its 37 chapters, each written by an authority in the educational film field, examines in detail the growing importance of the motion picture in school and community life. In the first of the five parts into which the book is divided, the Nature of the Educational Film is considered. Part Two traces the growth of the educational film use in our teaching institutions and presents an up-to-date survey of the non-theatrical film in all of its applications for the school and for community groups. In Part Three, the Educational Film Outside the Classroom is adequately dealt with. Parts Four and Five deal with the Educational Film Abroad and with Administrative Problems and Practices.

While there is naturally some unevenness in reader interest, unavoidable in a symposium such as this, through wise advance planning, the editor has in the main succeeded in avoiding the pitfalls of duplication.

Although the major emphasis is upon application of the film rather than upon techniques of production or usage, this volume should be read with special care by documentary film producers, for throughout there are valuable suggestions for the production of films and constructive criticism of current methods, particularly in the teaching areas.

Teachers, preachers, and health, medical, industrial, business and community leaders will all find stimulation and practical suggestions in the various chapters of the book. It should be a must on their reference library shelves.

KENNETH D. WIDDEMER

Manual of Clinical Laboratory Methods—*By Opal E. Hepler, Ph.D., M.D. (4th ed.) Springfield, Ill.: Thomas,* 1949. 395 pp. Price, $8.50.

Three previous editions of this work have appeared in planograph form, the present edition being in book form printed on large 8" x 11" pages with many tables, photographs, sketches, and 8 full page color plates.

Selected procedures covering the entire range of clinical laboratory work are presented in precise outline form, step by step directions, in numbered order, in cook-book style. In most instances only the one method which the author regards most highly is included for each determination. Each method is preceded by a brief and concise discussion of the principles involved, followed by a general consideration of its usefulness and the precautions necessary to avoid errors in performance or interpretation. While the manual is not intended to be a textbook on clinical pathology, it does not fall into the error of some manuals in entirely avoiding all mention of the clinical significance of various findings. Sections on interpretation follow each method, and several extensive tables on differential diagnosis are included for the purpose of stimulating the interest of the technician.

Such recent developments are covered as methods for the assay of penicillin and streptomycin, sensitivity tests for these drugs, methods for the determination of Rh and Hr antibodies and blocking antibodies, and titration of blood plasma for ascorbic acid and vitamin A. The chapter on mycology is outlined from the recent *Manual of Clinical Mycology* by Conant and associates, and illustrated by some particularly good photographs. Chapters on basal metabolism and electrocardiography increase the usefulness of the text.

To the hospital laboratory technician who desires and needs exact directions for each examination, the *Manual* should prove invaluable. Its value to students and research workers would be enhanced if source references for the various methods and interpretative conclusions were given. It can be recommended to all clinical laboratories.

EDMUND K. KLINE

Backgrounds of Social Medicine—*Papers Presented at a Round Table at the 1947 Annual Conference of the Milbank Memorial Fund. New York: Milbank Memorial Fund,* 1949. 202 pp. Price, $1.00.

This is a valuable book which will prove useful to all students of public health and social medicine. It includes a historical survey of the concept of social medicine by George Rosen, a discussion of statistical approaches by Lowell Reed, and reviews of our present knowledge of the relation of socio-environmental factors to mortality by Dorothy Wiehl, to illness by Jean Downes, to physical impairments by Rollo Britten, and to mental hygiene by R. H. Felix and R. V. Bowers. The re-

lation of the industrial and occupational environment to health is discussed by Ruth Puffer, and the role of nutrition by H. D. Kruse. In addition, there is a very stimulating discussion of the papers by other participants in the conference.

Perhaps the book's greatest value lies in the fact that the authors of the various papers have not only summarized present data but have also indicated the gaps in our knowledge, and have in many instances suggested steps which might be taken to fill those gaps. The data presented and the suggestions made by the authors provide numerous points of departure for research in social medicine. It is evident that while much general knowledge exists today on the role of social factors in health and illness, there has been little success in isolating specific factors and determining their relative importance. New types of intensive investigations are clearly needed.

One criticism which may be made is the rather narrow definition of social medicine implicit in the scope of papers presented. In the reviewer's opinion the field of social medicine comprises all interrelationships of medicine and society, and includes therefore the social organization of medicine as well as the social epidemiology of health and disease. MILTON TERRIS

Alcohol and Human Affairs—*By W. B. Spalding and J. R. Montague. Yonkers, N. Y.: World Book Co.,* 1949. 248 pp. Price, $1.64.

The senior author, Dean of the College of Education at the University of Illinois, and the junior author, a physician and member of the educational advisory committee of the Oregon State Liquor Commission, one of the more progressive states, which recognizes problem drinking as a medical complex and has established a sound medical and educational program to cope with it, has undertaken a challenging and difficult job in the preparation of this book for teen age students.

While they attempt to hew to the middle of the road, to present the many aspects of "the drinking problem" (and particularly that ubiquitously-used but ill-defined term, "excessive drinking"), they manifest many biases. It is unfortunate that a complex problem such as this, too long permeated with emotionality and stereotype thinking, is still presented in such value terms as *bad* and *evil*. Despite this dereliction, the authors give an accurate though simplified account of the physiology of alcohol in the human body, its normal and pathological effects, drinking patterns in American society, and some pertinent facts about the liquor industry and its importance in modern society. One of the weakest and, in fact, misleading sections of the book, deals with the social costs of drinking evaluated in terms of disorganization, divorce, delinquency, crime, and accidents. In their presentation the authors help to perpetuate the stereotypes traditionally put forth by vested interests groups engaged in the prohibition argument.

Against these limitations the authors take a forward looking attitude toward the modern medical treatment of the alcoholic, describing various forms of therapy, the Alcoholics Anonymous program, and the growing interests on the part of state and local governments to set up adequate treatment facilities.

A postscript section of the book is, in the traditional educational fashion, devoted to Tobacco, Narcotics and Other Drugs. A small but usable bibliography and suggested agencies furnishing publications on the problems of alcohol are included. JOSEPH HIRSH

Current Therapy 1949—*By Howard F. Conn, M.D., Editor. Philadelphia: Saunders,* 1949. 672 pp. Price, $10.00.

The informed layman who reads his newspaper must be impressed with the rapidity with which new drugs and therapeutic procedures have been introduced into the practice of medicine during the last two decades. The practising physician who must keep abreast of many more of these developments through his professional journals can find it no easy task to maintain the accelerated pace with which they are reported. In this attractive publication he will find his task materially lightened by an imposing number of eminent medical authorities who describe in detail their own favored methods of treating the majority of diseases that will be encountered in the practice of medicine.

The usefulness of this reference work is enhanced by the readability of the subject matter, the clarity of type, and a good index. The tendency to include a brief and often insufficient discussion of disease and its diagnosis that is characteristic of some textbooks on therapy has been avoided. The reader of this book is expected to be familiar with the disease in question or to consult other texts for a more complete description of it. Thus the editors have been enabled to devote sufficient space to the subject of therapy without creating an unwieldy volume.

In a number of instances alternative methods of treatment of a disease are given by different authors and the choice of method is left to the reader. Both specific and symptomatic therapy are adequately covered. The book's value as a current source of information is emphasized by the references made in it to the use of aureomycin, chlormycetin and Vitamin B_{12}.

The dating of the title creates the impression that this book will be issued each year, or perhaps at less frequent intervals in order to keep it up to date. In that case, it might have been wiser to have issued a loose-leaf volume in order to avoid the expense of buying frequent editions. Whether this method is adopted in the future or a yearly volume is issued, this work is a welcome addition to the literature on therapy.

HENRY B. MAKOVER

Happy Days with Our Friends—*By Elizabeth Montgomery, W. W. Bauer, M.D., and William S. Gray, Reading Director. Teacher's Edition.* 95 pp. plus Guidebook of 80 pp. Price, $.96.

You—*By Dorothy Baruch, Elizabeth Montgomery, and W. W. Bauer, M.D. Teacher's Edition.* 288 pp. plus Guidebook of 127 pp. Price, $1.48.

You and Others—*By Helen Shacter and W. W. Bauer, M.D. Pupils' Edition.* 288 pp. Price, $1.56. *Chicago: Scott, Foresman and Co.,* 1948.

The broader concept of health has been incorporated into the text material of these three books for grades one, five, and six, respectively, a part of the new Health and Personal Development Series. A well planned health program is presented in each book.

It is significant that a considerable amount of material, especially in Books 1 and 6, is devoted to the usually omitted health concepts in the areas of mental and social health, personal development, and likenesses and differences in physical and emotional behavior. Experts on each age level have prepared and illustrated the texts. Consequently, the needs and abilities of children have been determining factors in the selection and grade placement of the learning experiences.

The approach is unique in that the content is developed by stories of real experiences of boys and girls. Typical problems and experiences of children are presented by colorful pictures and easy-to-read text. Modern concepts of motivation are incorporated, such as questions to stimulate thinking and suggested activities (although not always functional). This reviewer regrets the

omission of any reference to reproduction, a knowledge of which is so essential for the development of a well adjusted individual.

The excellent guidebooks in the Teacher's Edition give detailed lesson plans which point up the health values inherent in the text to guide group discussion. Modern points of view of health teaching and the needs and characteristics of the particular age group are incorporated. "Implications for Parent-Teacher Cooperation" should aid in the improvement of pupil health. Selected bibliographies and films are listed.

One of the best criteria of textbooks is the request of pupils to reread a book. Through actual use in the classroom these books meet this critical test.

EDITH M. LINDSAY

The Child in Health and Disease —*By Clifford G. Grulee and R. Cannon Eley. Baltimore: Williams & Wilkins,* 1948. 1006 pp. Price, $12.00.

This book, the latest addition to the textbooks of diseases of children, sets out to correct what the editors decry as "the attitude of indifference . . . whenever the practical side of pediatrics comes to the fore." Production of the volume was attended with a series of unexpected difficulties related to the war, delaying publication several years and necessitating "readjustment and rewriting" of the manuscripts.

The long list of contributors includes many outstanding workers in their respective fields but it is perhaps not unexpected that the results are uneven. Some sections are good and some not all that one might wish for. Infectious diseases receive considerable attention but one wonders at the separation of "Communicable Diseases" from "Acute Infections." Such diseases as streptococcal sore throat and malaria are certainly as communicable as meningitis or vaccinia. Furthermore, scarlet fever, discussed separately under "Communicable Diseases" is classified properly as one form of streptococcosis under "Acute Infections."

Treatment advised in the various chapters usually follows the predilections of the author. Some of the advice is surprising, such as the injunction to treat the common cold promptly with sulfadiazine. It is doubtful whether many would agree that a cold is sufficient indication for sulfonamide therapy.

This reviewer was puzzled by the difficulty in finding the discussion of treatment of common diarrheal disorders which are so important a problem in childhood. They are not listed under diarrhea in the index but are included under nutritional disorders. There is a chapter on dysentery but, in view of recent epidemiological data here and abroad, it seems that a more extensive presentation of Salmonellosis would have been in order.

Many tables are included in the text and an innovation is a listing of commonly used proprietary foods, giving their brand names and data on composition just as supplied by the manufacturers. Interpretation would have been easier had the figures been reduced to common units or a common base. It is not easy, furthermore, to understand why one brand of powdered half-skimmed milk is included under "Complete Foods," and another, of almost identical composition, under "Milk."

Heavily coated paper stock and lightface type make reading rather difficult and a large number of annoying misprints are present, something to which it seems one must grow accustomed when a first edition of a new work appears. In general, the many illustrations are well chosen and clearly reproduced. MYRON E. WEGMAN

First Session—Penn Top, Part 1, Hotel Statler

A Report on the Cancer Diagnostic Test Program at the University of Washington. STUART W. LIPPINCOTT, M.D.

Discussant: LOUIS HERLY, M.D.

The Maryland Demonstration Project on Cancer Morbidity Reporting and Nursing Services. W. ROSS CAMERON, M.D., AND MARY SEARS, R.N.

Discussant: LESTER BRESLOW, M.D.

MONDAY, 9:30 A.M.

PUBLIC HEALTH CANCER ASSOCIATION (Cont.)

Epidemio-Statistical "Studies of Cancer" (Progress Report). RUTH R. PUFFER, DR.P.H.

Discussant: MORTON L. LEVIN, M.D.

Breast Cancer Problem in Cancer Control. CUSHMAN HAAGENSEN, M.D.

Discussant: IRA NATHANSON, M.D.

MONDAY, 12:30 P.M.

AMERICAN PUBLIC HEALTH ASSOCIATION GOVERNING COUNCIL

Luncheon and Afternoon Meeting—Salle Moderne, Hotel Statler

CONFERENCE OF MUNICIPAL PUBLIC HEALTH ENGINEERS

Luncheon Session—Panel Room, Hotel New Yorker

Presiding: MORTON S. HILBERT, *Chairman.*

Business meeting.

CONFERENCE OF PROFESSORS OF PREVENTIVE MEDICINE

Luncheon and Afternoon Sessions—Parlor 1, Hotel Statler

MONDAY, 2:30 P.M.

AMERICAN SCHOOL HEALTH ASSOCIATION

Second Session—North Ballroom, Hotel New Yorker

Presiding: CHARLES KEENE, M.D.

THE PARTICIPATION OF SCHOOL HEALTH PERSONNEL IN THE SCHOOL HEALTH EDUCATION PROGRAM

Panel Discussion

Participants:

The Physician. MILDRED E. DOSTER, M.D.

The Health Educator. W. W. PATTY, PH.D.

The Science Instructor. HUBERT EVANS, PH.D.

The Nurse. MARY ELLA CHAYER, R.N.

MONDAY, 2:30 P.M.

CONFERENCE OF MUNICIPAL PUBLIC HEALTH ENGINEERS AND CONFERENCE OF STATE SANITARY ENGINEERS

Joint Session—Panel Room, Hotel New Yorker

Presiding: W. W. TOWNE AND MORTON S. HILBERT.

Administration of Federal Stream Pollution Bill. CARL E. SCHWOB.

Report of Joint Committee on Rural Sanitation. WILLIAM H. CARY, JR., C.E.

Federal Health Bill in Relation to Sanitation Programs. (Speaker to be announced.)

Discussion of Administrative Problems, State and Local. (Speaker to be announced.)

Discussion of Need for Joint Committee on Sanitation Standards for Circuses, Carnivals, and Tent Shows. (Speaker to be announced.)

PUBLIC HEALTH CANCER ASSOCIATION

Second Session—Penn Top, Part 1, Hotel Statler

The Radiologist in Cancer Control: Recent Developments and Progress in Radio-Curability. MAURICE LENZ, M.D.

Discussant: MILTON FREIDMAN, M.D.

The Pharmacist in the Cancer Program. ROBERT P. FISCHELIS, Sc.D.

Discussant: RAY KAISER, M.D.

Experience with Postgraduate Extension Services in Cancer Pathology. ARTHUR PURDY STOUT, M.D.

Discussant: FRANK W. FOOTE, JR., M.D.

Occupational Cancer Survey in Ohio. THOMAS F. MANCUSO, M.D.

Discussant: MAY R. MAYERS, M.D.

National Cancer Institute Program for the Evaluation of Cancer Diagnostic Tests. JOHN E. DUNN, M.D., AND SAMUEL W. GREENHOUSE.

Discussant: FREDDY HOMBERGER, M.D.

MONDAY, 2:30 P.M.

SUBCOMMITTEE ON ACCIDENT PREVENTION OF THE COMMITTEE ON ADMINISTRATIVE PRACTICE

Parlor 2, Hotel Statler

Presiding: I. JAY BRIGHTMAN, M.D.

RECOGNIZED PUBLIC HEALTH TECHNIQUES AS APPLIED TO HOME ACCIDENT PREVENTION PANEL DISCUSSION

The Role of the State Health Officer. A. J. CHESLEY, M.D.

The Role of the Local Health Officer. EARLE G. BROWN, M.D.

The Role of the Public Health Nurse. ELIZABETH C. PHILLIPS, R.N.

The Role of the Sanitary Engineer. FREDERICK S. KENT.

The Role of the Director of Vital Statistics. HALBERT L. DUNN, M.D.

The Need for Research in the Home Safety Program. A. L. CHAPMAN, M.D.

Discussion.

Summary by Chairman.

MONDAY, 5:00 P.M.

RECEPTION TO THE PRESIDENT OF THE AMERICAN PUBLIC HEALTH ASSOCIATION

Ballroom, Hotel Statler, 5–6:30 P.M., Informal

MONDAY, 6:30 P.M.

ASSOCIATION OF MATERNAL AND CHILD HEALTH AND CRIPPLED CHILDREN'S DIRECTORS

Dinner Session—East Room and Room 424, Hotel New Yorker, followed by evening session, 8:30 P.M.

ENGINEERING SECTION, CONFERENCE OF MUNICIPAL PUBLIC HEALTH ENGINEERS, AND CONFERENCE OF STATE SANITARY ENGINEERS

Annual Engineers' Stag Dinner, Keystone Room, Hotel Statler

"BILL" ORCHARD, *Master of Ceremonies*

MONDAY, 6:30 P.M.

LABORATORY SECTION AND THE CONFERENCE OF STATE AND PROVINCIAL PUBLIC HEALTH LABORATORY DIRECTORS

Dinner and Evening Session—Penn Top, Part 3, Hotel Statler

COMMEMORATION OF THE FIFTIETH ANNIVERSARY OF THE FOUNDING OF THE SECTION

Presiding: HOWARD J. SHAUGHNESSY, PH.D., AND F. R. HASSLER, M.D.

MONDAY, 8:00 P.M.

ASSOCIATION OF STATE AND TERRITORIAL HEALTH OFFICERS

Evening Session—Conference Room 3, Hotel Statler

MONDAY, 8:30 P.M.

AMERICAN SCHOOL HEALTH ASSOCIATION

Third Session—North Ballroom, Hotel New Yorker

Presiding: WILLIAM E. AYLING, M.D., *President-Elect.*

THE PREPARATION OF, AND PROBLEMS IN SECURING ADEQUATE SCHOOL HEALTH PERSONNEL

Moderator: FRED V. HEIN, PH.D.

Directors of School Health Departments. CHARLES C WILSON, M.D.

Nurses. LULA P. DILWORTH, R.N.

Examining Physicians. GAGE WETHERILL, M.D.

Health Coördinators. HOWARD W. LUNDY, DR.P H.

ASSOCIATION OF RESERVE OFFICERS OF THE U. S. PUBLIC HEALTH SERVICE

Evening Session—Salle Moderne, Hotel Statler

COMMISSIONED OFFICERS ASSOCIATON, U. S. PUBLIC HEALTH SERVICE

Evening Session—Conference Room 9, Hotel Statler

MONDAY, 8:30 P.M.

FOOD AND NUTRITION SECTION

Evening Session, Parlor D, Hotel New Yorker

Presiding: PAUL S. PRICKETT, PH.D., *Chairman.*

Meeting of Section Council and Committee Chairmen.

TUESDAY, 8:00 A.M.

CLEVELAND HEALTH MUSEUM, NATIONAL ADVISORY COUNCIL

Breakfast Session—Parlor F, Hotel New Yorker

TUESDAY, 9:30 A.M.

ENGINEERING SECTION, THE CONFERENCE OF MUNICIPAL PUBLIC HEALTH ENGINEERS, AND THE CONFERENCE OF STATE SANITARY ENGINEERS

Joint Session—North Ballroom, Hotel New Yorker

Presiding: M. ALLEN POND, MORTON S. HILBERT, AND W. W. TOWNE.

Report of the Engineering Section Committee on Municipal Public Health Engineering. *Chairman,* MORTON S. HILBERT.

Report of the Engineering Section Committee on Training. *Chairman,* ELLIS S. TISDALE.

Training Future Sanitary Engineers in Engineering Colleges. HAROLD B. GOTAAS, SC.D.

Problems of Sanitation in Fringe Areas. SAMUEL R. MCGURK AND BLUCHER A. POOLE.

Highlights on Sewage Disposal. LOUIS F. WARRICK.

British Experience in the Collection and Disposal of Refuse. J. C. DAWES.

DENTAL HEALTH SECTION

First Session—Parlor 1, Hotel Statler

Presiding: PHILIP E. BLACKERBY, JR., D.D.S., *Chairman.*

RESEARCH IN THE DENTAL FIELD IN PUBLIC HEALTH

Dental Findings in the Fluorination Project at Kingston, N. Y. DAVID B. AST, D.D.S.

Pediatric Findings in the Fluorination Project at Kingston, N. Y. EDWARD SCHLESINGER, M.D.

TUESDAY, 9:30 A.M.

DENTAL HEALTH SECTION (Cont.)

Chemical Agents in the Field of Dental Caries Research (Those Having an Effect on the Tooth Itself). NORMAN S. SIMMONS, D.D.S.

Chemical Agents in the Field of Dental Caries Research (Those Agents Which Affect the Acidogenic Organisms of the Mouth). JOHN W. HEIN, D.D.S.

Periodontia in Public Health. SAMUEL CHARLES MILLER, D.D.S.

EPIDEMIOLOGY SECTION

First Session—Penn Top, Part 1, Hotel Statler

Presiding: JOHN J. PHAIR, M.D., *Chairman.*

The Relation of Housing to the Incidence of Meningococcic Infection in an Outbreak in Oak Ridge, Tenn. BERNARD M. BLUM, M.D., AND WILLIAM F. ELKIN.

Meningitis Associated with an Epidemic of *Salmonella panama* in Infants. FREDERICK S. LEEDER, M.D., G. W. SCHELM, M.D., AND ARNOLD JUENKER.

Effective Control of an Outbreak of Rabies in Memphis and Shelby County, Tennessee. ERNEST S. TIERKLL, V.M.D., LLOYD M. GRAVES, M.D., AND H. G. TUGGLE.

Q Fever in Southern California. JOSEPH A. BELL, M.D., ROBERT J. HUEBNER, M.D., AND M. DOROTHY BECK.

Apparent Decline in the Rate of Tuberculosis Infection among Household Associates of Sputum-Positive Cases of Tuberculosis. WENDELL R. AMES, M.D., AND HAROLD C. MILES, M.D.

Election of Section Officers.

FOOD AND NUTRITION, MATERNAL AND CHILD HEALTH, MEDICAL CARE, AND PUBLIC HEALTH NURSING SECTIONS

Joint Session—Ballroom, Hotel Statler

Presiding: ALICE H. SMITH, HERBERT R. KOBES, M.D., ELLEN C. POTTER, M.D., AND RUTH FREEMAN, R.N.

REHABILITATION OF CRIPPLED CHILDREN AND ADULTS ROUND TABLE

Moderator: BEN L. BOYNTON, M.D.

The Crippled Children's Program. CARLETON DEAN, M.D.

Role of the General Hospital. DONALD A. COVALT, M.D.

The Veterans Administration Program. A. B. C. KNUDSON, M.D.

Vocational Rehabilitation. CORBETT REEDY.

HELENE SENSENICH.

HELEN STACEY.

TUESDAY, 9:30 A.M.

HEALTH OFFICERS SECTION

First Session—Keystone Room, Hotel Statler

Presiding: STANFORD F. FARNSWORTH, M.D., *Chairman.*

PUBLIC HEALTH ADMINISTRATION—AT HOME AND ABROAD

The Health Officer and His Staff Receive the Foreign Visitor. HENRY R. O'BRIEN, M.D.

Public Relations in Public Health. VLADO A. GETTING, M.D.

(Other speakers to be announced.)

INDUSTRIAL HYGIENE SECTION

First Session—Parlor 2, Hotel Statler

Presiding: WILLIAM G. FREDRICK, Sc D., *Chairman.*

INDUSTRIAL HYGIENE MARCHES ON—THE THIRTY-FIFTH ANNIVERSARY OF THE SECTION

The Past and Future of Industrial Health. (Speaker to be announced.)

Labor's Viewpoint on Industrial Health. LEO PRICE, M.D.

The Government and Industrial Health. (Speaker to be announced.)

The Educator Views Industrial Health. (Speaker to be announced.)

The Role of Technical Societies in Industrial Health (Speaker to be announced.)

LABORATORY SECTION

First Session—Salle Moderne, Hotel Statler

Presiding: HOWARD J. SHAUGHNESSY, PH.D., *Chairman.*

BRUCELLOSIS

Brucellosis. CHARLES M. CARPENTER, M.D.

Studies of Brucellosis in Indiana. SAMUEL R. DAMON, PH.D.

Screen Testing in Brucellosis: Laboratory Confirmation of Diagnosis of Brucellosis. NELL HIRSCHBERG, PH.D.

The Brucella Ring Test. RONALD M. WOOD, PH.D.

The Brucella Ring Test: Its Potential Value in the Control of Brucellosis. ALBERT V. HARDY, M.D.

The Brucella Ring Test in Mixed Raw Milk Supplies. HARRY E. BREMER.

TUESDAY, 9:30 A.M.

PUBLIC HEALTH EDUCATION SECTION

First Session—East Room and Room 424, Parlors E and H, Parlor F and Parlor G, Hotel New Yorker. Conference Room 2, Hotel Statler.

MEETINGS OF THE STANDING COMMITTEES OF THE SECTION

9:30–12:00 East Room and Room 424, New Yorker	Committee on Materials and Techniques. BERYL J. ROBERTS AND YOLANDE LYON, *Co-Chairmen.*
9:30–12:00 Parlors E and H, New Yorker	Committee on Commercial Advertising and Health Education. MARY P. CONNOLLY, *Chairman.*
9:30–12:00 Parlor F, New Yorker	Committee on Case Studies in Community Organization. LUCY S. MORGAN, PH D, AND VIVIAN DRENCKHAHN, *Co-Chairmen.*
9:30–12:00 Parlor G, New Yorker	Committee on Public Health Education Planning. C. MAYHEW DERRYBERRY, PH.D., AND ANN W. HAYNES, *Co-Chairmen.*
9:30–12:00 Conference Room 2, Statler	Committee on Public Health Films. KENNETH D. WIDDEMER, *Chairman.*

SCHOOL HEALTH SECTION

First and Second Sessions—Panel Room, Parlors A and C, Hotel New Yorker

Presiding: WARREN H. SOUTHWORTH, DR.P.H., *Chairman.*

ROUND TABLES ON SCHOOL HEALTH

9:30–12:00 2:30– 3:30 Panel Room, New Yorker	Undergraduate Training Programs in Health Education for Elementary School Teachers. *Discussion Leader:* JOHN H. SHAW, ED.D.
9:30–12:00 2:30– 3:30 Parlor A, New Yorker	Health Service Programs for Secondary Schools. *Discussion Leader:* REGINE K. STIX, M.D.
9:30–12:00 2:30– 3:30 Parlor C, New Yorker	How to Judge the Effectiveness of a School Health Program. *Discussion Leader:* DOROTHY B. NYSWANDER, PH.D.
3:45 P.M. Panel Room, New Yorker	Summary Session. *Discussion Leader:* WARREN H. SOUTHWORTH, DR.P.H.

Section Business.

TUESDAY, 9:30 A.M.

STATISTICS SECTION

First Session—Penn Top, Part 3, Hotel Statler

Presiding: FORREST E. LINDER, PH D, *Chairman.*

CURRENT DEVELOPMENTS *

Changes in Mortality through the Use of the New International Statistical Classification. CARL L. ERHARDT, AND LOUIS WEINER, C.E.

Discussant: HENRY J. KLEIN.

Incompleteness of Reporting of Fetal Deaths. LEONA BAUMGARTNER, M.D.

Morbidity Statistics—Do We Want Them? PERCY STOCKS, M.D.

Recent Developments in Public Health Statistics. HALBERT L. DUNN, M.D.

Section Business.

* Members of the Section should plan to visit Open House at the Metropolitan Life Insurance Company, Wednesday afternoon, October 26. See Scientific Trips in Final Program.

TUESDAY, 12:30 P.M.

ENGINEERING SECTION

Luncheon Session—North Ballroom, Hotel New Yorker

Presiding: M. ALLEN POND, *Chairman.*

Report of the Engineering Section Council for 1949. GEORGE O. PIERCE

Report of the Engineering Section Project. FRANCIS B. ELDER.

Report of the Engineering Section Committee on Membership. *Chairman,* H. E. MILLER.

Report of the Engineering Section Policy Advisory Committee. *Chairman,* JOEL C. BEALL.

Section Business.

PUBLIC HEALTH EDUCATION SECTION

Luncheon Session—Salle Moderne, Hotel Statler

Presiding: A. HELEN MARTIKAINEN, *Chairman.*

Election of Officers.

Public Health Practices in Germany. W. W. BAUER, M.D., AND LT. COL. WALTER R. DEFOREST, M.C.

Section Business.

TUESDAY, 2:30 P.M.

DENTAL HEALTH SECTION AND THE AMERICAN SCHOOL HEALTH ASSOCIATION

Joint Session—Keystone Room, Hotel Statler

Presiding: PHILIP E. BLACKERBY, JR., D.D.S., AND ROBERT A. DOWNS, D.D.S.

CONTRIBUTIONS TO A GOOD SCHOOL DENTAL EDUCATION PROGRAM

Discussion.

Motion Picture Film: It's Your Health.

Discussants:

MARGARET H. JEITREYS

EMILY BROWN

ENGINEERING, FOOD AND NUTRITION, HEALTH OFFICERS, INDUSTRIAL HYGIENE, PUBLIC HEALTH EDUCATION, PUBLIC HEALTH NURSING, AND STATISTICS SECTIONS

Joint Session—Ballroom, Hotel Statler

Presiding: M. ALLEN POND, MARGARET C. MOORE, STANFORD F. FARNSWORTH, M.D., WILLIAM G. FREDRICK, SC.D., A. HELEN MARTIKAINEN, RUTH FREEMAN, R.N., AND FORREST E. LINDER, PH.D.

SURVEY METHODS, THEIR APPLICATION, CONTRIBUTION, AND EFFICACY

Panel Discussion

Moderator: HUGH R. LEAVELL, M.D.

Participants:

JOHN D. PORTERFIELD, M.D.

MARION FERGUSON, PH.D.

CLAIR E. TURNER, DR P H.

WILLIAM T. INGRAM

A. HUGHES BRYAN, M.D.

HAROLD F. DORN, PH.D.

ENGINEERING SECTION

First Session—North Ballroom, Hotel New Yorker

Presiding: CHARLES L. SENN, *Vice-Chairman.*

Utilization of Sanitary Engineers in the Army. LT. COL. RAYMOND J. KARPEN.

TUESDAY, 2:30 P.M.

ENGINEERING SECTION (Cont.)

Discussants:

VINCENT B. LAMOUREUX, C. E.

GORDON E. McCALLUM, C.E.

Sanitary Implications of the Missouri Valley Project. GLEN J. HOPKINS.

A Practical Public Relations Program in Los Angeles. CHARLES R. SENN.

Principles of Human Persuasion As Applied by Industry. FEN K. DOSCHER.

EPIDEMIOLOGY, HEALTH OFFICERS, LABORATORY, AND MATERNAL AND CHILD HEALTH SECTIONS

Joint Session—Penn Top, Hotel Statler

Presiding: HOLLIS S. INGRAHAM, M.D., HOWARD J. SHAUGHNESSY, PH.D., SARAH S. DEITRICK, M.D., AND JOHN M. WHITNEY, M.D.

SIMULTANEOUS OR MULTIPLE IMMUNIZATION

Simultaneous Immunization of Young Children against Diphtheria, Tetanus, and Pertussis; Experience in a Northern Metropolitan Area. LOUIS W. SAUER, M.D., AND WINSTON H. TUCKER, M.D.

Simultaneous Immunization of Young Infants against Diphtheria, Tetanus, and Pertussis; Experience in a Southern Metropolitan Area. J. CYRIL PETERSON, M.D., AND AMOS CHRISTIE, M.D.

Simultaneous Immunization of New-born Infants against Diphtheria, Tetanus, and Pertussis; Production of Antibodies and Duration of Antibody Levels in an Eastern Metropolitan Area. PAUL A. DISANT'AGNESE, M.D.

Simultaneous Immunization against Diphtheria, Tetanus, and Pertussis; Problems Inherent in the Production of a Good Multiple Antigen. RODERICK MURRAY, M.D.

Simultaneous Immunization against Diphtheria, Tetanus, and Pertussis; Practical Applications in Use of Multiple Antigens in Public Health Immunization Programs. JOHN J. PHAIR, M.D.

FOOD AND NUTRITION SECTION

First Session—Parlor 1, Hotel Statler

Presiding: PAUL S. PRICKETT, PH.D., *Chairman.*

THE HEALTH ASPECTS OF CHEMICALS INTRODUCED IN FOODS

General Comments. PAUL S. PRICKETT, PH.D.

Chemicals Introduced in the Production of Foods. JAMES R. WILSON, M.D.

Chemicals Introduced in the Processing of Foods. FRANKLIN C. BING, PH.D.

Protection Afforded the Consumer. W. B. WHITE, PH.D.

TUESDAY, 2:30 P.M.

FOOD AND NUTRITION SECTION (Cont.)

The Application of the Federal Food, Drug and Cosmetic Act to Added Chemicals in Foods for Public Health Protection. CHARLES WESLEY DUNN.

Discussion.

Section Business.

LABORATORY SECTION

Second Session—Parlor 2, Hotel Statler

Presiding: HOWARD J. SHAUGHNESSY, PH.D., *Chairman.*

VIRUS, RICKETTSIA, SYPHILIS

"Q" Fever in a Wool and Hair Processing Plant. M. MICHAEL SIGEL, PH.D., T. F. MCNAIR SCOTT, M.D., WERNER HENLE, M.D., AND O. HENRY JANTON, M.D.

Complement-Fixing and Neutralizing Antibody Studies on Human Beings Vaccinated against Rabies. HERALD R. COX, SC.D., IRVING LEBELL, M.D., C. J. DEBOER, PH.D., AND EDNA K. HAZZ.

Studies of a Freshly Isolated Strain of Influenza Virus A: Antigenic Analysis and Serologic Response to Subcutaneous and Intracutaneous Vaccination. IRVING GORDON, M.D., SOPHIA M. COHEN, GLADYS M. GNESH, AND ELINOR WHITNEY.

Laboratory Studies on Treponemal Immobilizing Antibodies in Syphilis. ROBERT A. NELSON, JR., M.D.

The False-Positive Reaction in Serology of Syphilis: The Presence of an Anti-Acetone Soluble Substance in Human Serum. DANIEL WIDELOCK, PH.D., MARY F. GONSHOREK, AND LILLIAN MARSDEN.

The Use of Multiphasic Agglutination and Special Complement-Fixation Tests for Screening Bacterial and Virus Diseases in the Fourth Army Medical Laboratory. COL. DWIGHT M. KUHNS, M.C.

MEDICAL CARE SECTION

First Session—Parlors F and G, Hotel New Yorker

Presiding: EDWARD S. ROGERS, M.D., *Chairman.*

REGIONALIZATION OF MEDICAL SERVICES ROUND TABLE

General Considerations. HENRY B. MULHOLLAND, M.D.

The Michigan Program. GRAHAM L. DAVIS.

TUESDAY, 2:30 P.M.

MEDICAL CARE SECTION (Cont.)

Experience in New England. BROOKS RYDER, M.D.

Regional Hospital Organization in Great Britain. A. LESLIE BANKS, M.D.

Integration of Local Health and Medical Service Districts. JOSEPH W. MOUNTIN, M.D.

BASIL C. MACLEAN, M.D.

RUSSELL A. NELSON, M.D.

SCHOOL HEALTH SECTION

CONTINUATION OF ROUND TABLES ON SCHOOL HEALTH

See page 1206

TUESDAY, 8:30 P.M.

FIRST GENERAL SESSION

Ballroom, Main Floor, Manhattan Center, 34th Street and Eighth Avenue

Presiding: CHARLES F. WILINSKY, M.D., *President,* American Public Health Association.

Addresses of Welcome:

HONORABLE WILLIAM O'DWYER, Mayor of the City of New York.

HERMAN E. HILLEBOE, M.D., Commissioner, New York State Department of Health.

HARRY S. MUSTARD, M.D., Commissioner, New York City Department of Health.

Presentation of the Lasker Awards for 1949.

WEDNESDAY, 8:00 A.M.

ALLEGHENY COLLEGE ALUMNI

Breakfast Session—Room 129, Hotel Statler

THE JOHNS HOPKINS UNIVERSITY ALUMNI

Breakfast Session—Salle Moderne, Hotel Statler

WEDNESDAY, 8:00 A.M.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY ALUMNI

Breakfast Session—East Room and Room 424, Hotel New Yorker

UNIVERSITY OF MICHIGAN ALUMNI

Breakfast Session—Penn Top, Part 3 Hotel Statler

ALUMNI OF THE SCHOOL OF PUBLIC HEALTH, UNIVERSITY OF NORTH CAROLINA

Breakfast Session—Parlors F and G, Hotel New Yorker

WEDNESDAY, 9:30 A.M.

DENTAL HEALTH SECTION

Second Session—Parlor 2, Hotel Statler

Presiding: PHILIP E. BLACKERBY, JR., D.D.S., *Chairman.*

REPORT ON TOPICAL FLUORIDE PROGRAM

Planning a Topical Fluoride Program on a District Level. WILLIAM P. KROSCHEL, D.D.S.

Organizing and Planning a State Topical Fluoride Program. ROY D. SMILEY, D.D.S.

Community and State Educational Program on Topical Fluoride Application. LELAND S. KLEINSCHMIDT.

(Other speakers to be announced.)

11:30 A.M. Business Meeting.

ENGINEERING SECTION

Second Session—Penn Top, Part 1, Hotel Statler

Presiding: M. ALLEN POND, *Chairman.*

Report of the Engineering Section Committee on Water Supply. *Chairman,* CHARLES R. COX.

New Haven Swimming Pool Studies. ERIC W. MOOD.

The Work and Objectives of the 3-A Sanitary Standards Committee. HAROLD S. ADAMS, PAUL CORASH, AND C. W. WEBER.

Ducks and Shellfish Sanitation. MILTON H. BIDWELL.

Engineering Aspects of Home Accident Prevention. FREDERICK S. KENT.

WEDNESDAY, 9:30 A.M.

EPIDEMIOLOGY AND LABORATORY SECTIONS

Joint Session—Columbia-Presbyterian Medical Center, 168th Street and Broadway, New York, N. Y.

Presiding: FRANKLIN H. TOP, M.D., AND HOWARD J. SHAUGHNESSY, PH.D.

MYCOLOGY

Serological Tests in the Diagnosis and Prognosis of Coccidioidomycosis. CHARLES E. SMITH, M.D., MARGARET T. SAITO, RODNEY RAU BEARD, M.D., RUTH MCFADDEN KEPP, R.N., RUTH WHEATLAKE CLARK, AND BERNICE U. EDDIE, D.P.H.

Laboratory Aids in the Diagnosis of North American Blastomycosis. NORMAN F. CONANT, PH.D.

Some Epidemiologic Studies on North American Blastomycosis. DONALD S. MARTIN, M.D.

Histoplasmosis: Animal Reservoirs and Other Sources in Nature of the Pathogenic Fungus, Histoplasma. C. W. EMMONS, PH.D.

Serologic Studies in Histoplasmosis. CAPTAIN SAMUEL SASLAW, M.C. AND CHARLOTTE C. CAMPBELL.

This session has been arranged by Rhoda W. Benham, Ph.D., and Harold W. Brown, M.D., of Columbia University. Following the presentation of the papers, luncheon will be provided at the Center in Bard Hall at the price of $1. Tickets will be available at the Registration Desk in Convention Headquarters at the Hotel Statler.

Plans are under consideration for an exhibit following the luncheon on various aspects of medical mycology, such as: (a) The pathology of fungous diseases; (b) Laboratory diagnosis; demonstration of the Woods light; direct slide and culture methods; (c) Etiology; demonstration of cultures. (d) Phase microscopy in the study of fungous diseases; (e) Infections of the central nervous system, skin and bone due to Cryptococcus.

FOOD AND NUTRITION SECTION

Second Session—Keystone Room, Hotel Statler

Presiding: PAUL S. PRICKETT, PH.D., *Chairman.*

THE USE OF ISOTOPES IN NUTRITION RESEARCH

Rates of Biological Processes Ascertained with the Aid of Isotopes. DEWITT STETTEN, JR., M.D.

Studies on the Metabolism of Niacin and Tryptophan Using Isotopes. JAMES M. HUNDLEY, M.D.

Isotopes and Iron Absorption. CARL V. MOORE, M.D.

Metabolism of Calcified Tissues Studied with Radioisotopes of Phosphorus, Calcium, and Carbon. W. D. ARMSTRONG, M.D.

Radioactive Iodine as a Diagnostic Tracer in the Study of Thyroid. K. E. CORRIGAN, PH.D.

WEDNESDAY, 9:30 A.M.

HEALTH OFFICERS, PUBLIC HEALTH EDUCATION, AND SCHOOL HEALTH SECTIONS, AND THE AMERICAN SCHOOL HEALTH ASSOCIATION IN COÖPERATION WITH THE NATIONAL COMMITTEE FOR MENTAL HYGIENE

Joint Session—Ballroom, Hotel Statler

Presiding: STANFORD F. FARNSWORTH, M.D., A. HELEN MARTIKAINEN, WARREN H. SOUTHWORTH, DR.P.H., AND WILLIAM E. AYLING, M.D.

INCORPORATING MENTAL HYGIENE CONCEPTS INTO PUBLIC HEALTH PROGRAMS

Mental Health Principles in the State and Local Health Program: A Commonwealth Fund Demonstration. H B. COTTRELL, M.D.

A Health Department Increases the Awareness of its Staff for Mental Hygiene. IVAN C. BERLIEN, M.D.

Nature of Mental Health Programs in Health, Welfare, and Educational Agencies under the National Mental Health Act. HENRY C. SCHUMACHER, M.D.

MATERNAL AND CHILD HEALTH SECTION

First Session—Parlor 1, Hotel Statler

Presiding: SARAH S. DEITRICK, M.D., *Chairman.*

PREMATURITY

Definition of Prematurity. NICHOLSON J. EASTMAN, M.D.

The New Premature Transport Service in New York City. HELEN M. WALLACE, M.D., AND MARGARET A. LOSTY, R.N.

Retrolental Fibroplasia. WILLIAM C. OWENS, M.D.

The Relationship of Fetal and Infant Mortality to Residential Segregation: An Inquiry into Social Epidemiology. ALFRED YANKAUER, JR., M.D.

What Happens to Prematures. HEDWIG KOENIG, M.D.

MEDICAL CARE SECTION

Second Session—North Ball Room, Hotel New Yorker

Presiding: DEAN A. CLARK, M.D.

VOLUNTARY HEALTH INSURANCE ON THE NATIONAL SCENE

The Present Status of Voluntary Health Insurance. MARGARET C. KLEM.

The Blue Cross-Blue Shield Program. PAUL R. HAWLEY, M.D.

Group Health Coöperatives. JERRY VOORHIS.

The United Mine Workers Health Program. WARREN F. DRAPER, M.D.

WEDNESDAY, 9:30 A.M.

STATISTICS SECTION

Second Session—Panel Room, Parlor C, Parlors E and H, Hotel New Yorker

Presiding: FORREST E. LINDER, PH.D., *Chairman.*

ROUND TABLES ON PUBLIC HEALTH STATISTICS

9:30–11:30 Parlor A, New Yorker	Cancer Statistics. *Discussion Leader:* HAROLD F. DORN, PH.D.
9:30–11:30 Parlor C, New Yorker	Marriage and Divorce Statistics. *Discussion Leader:* ELIZABETH PARKHURST.
9:30–11:30 Parlors E and H, New Yorker	Sampling Techniques in Public Health Statistics. *Discussion Leader:* THEODORE D. WOOLSEY.
9:30–11:30 Panel Room, New Yorker	Occupational and Industrial Mortality Statistics. *Discussion Leader:* ROBERT J. VANE.
11:30–1:30 Panel Room, New Yorker	Summary Session: *Discussion Leader:* FORREST E. LINDER, PH.D. *Section Business.*

WEDNESDAY, 12:30 P.M.

EPIDEMIOLOGY SECTION

Luncheon Session—Salle Moderne, Hotel Statler

Presiding: JOHN J. PHAIR, M.D., *Chairman.*

IN HONOR OF HAVEN EMERSON, M.D.

Introductory Remarks. JOHN J. PHAIR, M.D.

Introduction of Speakers. HENRY F. VAUGHAN, DR.P.H.

Haven Emerson—The Public Health Statesman. CHARLES F. BOLDUAN, M.D.

Haven Emerson—The Teacher. EARLE B. PHELPS, C.E.

Haven Emerson—The Epidemiologist. A. J. CHESLEY, M.D.

Response. HAVEN EMERSON, M.D.

WEDNESDAY, 12:30 P.M.

OVERSEAS LUNCHEON

Sponsored by the Lily-Tulip Cup Corporation

Penn Top, Part 3, Hotel Statler

All foreign delegates are cordially invited to attend. Please call at Exhibit Booth No. 10 on the Mezzanine for tickets of admission.

WEDNESDAY, 2:30 P.M.

GOVERNING COUNCIL

Second Meeting, Keystone Room, Hotel Statler

WEDNESDAY, 6:30 P.M.

AMERICAN SCHOOL HEALTH ASSOCIATION

Dinner Meeting—Salle Moderne, Hotel Statler

Presiding: CYRUS H. MAXWELL, M.D., *President.*

Presentation of the William A. Howe Award to:

A. O. DEWEESE, M.D.

CLAIR E. TURNER, DR.P.H.

Responses: DR. DEWEESE AND DR. TURNER.

Dinner Speaker: COLONEL JAMES P. COONEY, The School's Part in Meeting an Attack with the Atom Bomb.

COMMITTEE OF CONSULTANTS OF THE NATIONAL SANITATION FOUNDATION

Dinner and Evening Sessions—East Room and Room 424, Hotel New Yorker

DELTA OMEGA

Dinner Session—North Ballroom, Hotel New Yorker

GRADUATES' ORGANIZATION, SCHOOL OF HYGIENE, UNIVERSITY OF TORONTO

THURSDAY, 8:00 A.M.

UNIVERSITY OF MINNESOTA ALUMNI

Breakfast Session—Panel Room, Hotel New Yorker

YALE UNIVERSITY ALUMNI

Breakfast Session—Parlor 1, Hotel Statler

THURSDAY, 9:30 A.M.

DENTAL HEALTH, MATERNAL AND CHILD HEALTH, AND SCHOOL HEALTH SECTIONS

Joint Session—Keystone Room, Hotel Statler

Presiding: PHILIP E. BLACKERBY, JR., D.D.S., SARAH S. DEITRICK, M.D., AND WARREN H. SOUTHWORTH, DR.P.H.

ROUND-UP OF RESEARCH WITH IMPLICATIONS FOR SCHOOL AGE CHILDREN

What Does the School Physician See? (A cross-sectional study of the school physicians' clinical observations in 15,000 elementary school children.) ROBERT W. CULBERT, M.D., AND HAROLD JACOBZINER, M.D.

Study in the Reduction of Absences from School of Children with Ringworm of the Scalp. (A program of treatment, involving school, home, and clinic.) ROBERT W. CULBERT, M.D., MAX LERNER, M.D., AND ANNA E. R. ROBINSON, M.D.

Clinical Audiology in Public Health and School Health Programs. WILLIAM G. HARDY, PH.D.

Advancements in Dental Research and Dental Health Education Affecting the School Child. J. M. WISAN, D.D.S.

THURSDAY, 9:30 A.M.

ENGINEERING, LABORATORY, AND STATISTICS SECTIONS, AND THE BIOMETRICS SECTION OF THE AMERICAN STATISTICAL ASSOCIATION AND THE BIOMETRICS SOCIETY

Joint Session—Ballroom, Hotel Statler

Presiding: M. ALLEN POND, HOWARD J. SHAUGHNESSY, PH.D., AND FORREST E. LINDER, PH.D.

STATISTICAL METHODS FOR WATER AND SEWAGE ANALYSIS ROUND TABLE

Moderator: ABEL WOLMAN, DR. ENG.

Theory Underlying Most Probable Numbers. WILLIAM G. COCHRAN, PH.D.

Statistical Analysis in Laboratory Studies. (Speaker to be announced.)

Evaluation of Different Methods of Sewage Chlorination. JOHN W. FERTIG, PH.D., AND AUSTIN N. HELLER.

Statistical Study of Illness in Relation to Natural Bathing Water Quality. ALBERT H. STEVENSON AND THEODORE D. WOOLSEY.

FOOD AND NUTRITION SECTION AND THE AMERICAN SCHOOL HEALTH ASSOCIATION

Joint Session—North Ballroom, Hotel Statler

Presiding: MARIETTA EICHELBERGER, PH.D., AND WALTER WILKINS, M.D.

NUTRITIONAL ASPECTS OF SCHOOL FEEDING PROGRAMS

International Aspects of Child Feeding. MARJORIE L. SCOTT.

Preliminary Report of the Canadian Red Cross School Meal Study. ELIZABETH CHANT ROBERTSON, M.D.

School Lunches: Their Nutritive Value and Possible Effect on the Health and Diet of Children. MILICENT L. HATHAWAY, PH.D.

The Evaluation of the School Lunch from a Health Standpoint. CLARENCE A. VELAT, M.D.

The Value of School Lunch in a Community Nutrition Program. PAULINE BEERY MACK, PH.D., AND ANNA DEPLANTER BOWES.

EPIDEMIOLOGY SECTION

Second Session—Salle Moderne, Hotel Statler

Presiding: JOHN J. PHAIR, M.D., *Chairman.*

THE HISTORY OF AMERICAN EPIDEMIOLOGY

The Colonial Era and the First Years of the Republic (1620–1799). C.-E. A. WINSLOW, DR.P.H.

The Period of Great Epidemics (1800–1875). W. G. SMILLIE, M.D.

THURSDAY, 9:30 A.M.

EPIDEMIOLOGY SECTION (Cont.)

The Bacteriological Era (1876–1920). JAMES A. DOULL, M.D.

The Twentieth Century—Yesterday, Today, and Tomorrow. JOHN E. GORDON, M.D.

HEALTH OFFICERS AND MEDICAL CARE SECTIONS

Joint Session—Penn Top, Part 1, Hotel Statler

Presiding: STANFORD F. FARNSWORTH, M.D., AND MILTON TERRIS, M.D.

MEDICAL CARE AND THE LOCAL HEALTH DEPARTMENT

The Pattern of Organized Medical Care Programs in a Rural County. MILTON I. ROEMER, M.D., AND ETHEL A. WILSON.

Integration of Public Health and Hospital Services in Denver. JAMES P. DIXON, M.D.

The Baltimore Medical Care Program. HUNTINGTON WILLIAMS, M.D.

Program Analysis and Planning in Medical Care. LEONA BAUMGARTNER, M.D.

Discussants:

C. HOWE ELLER, M.D.

VERGIL N. SLEE, M.D.

JAMES A. THRASH, M.D.

LABORATORY SECTION

Third Session—Penn Top, Part 3, Hotel Statler

Presiding: HOWARD J. SHAUGHNESSY, PH.D., *Chairman.*

TUBERCULOSIS

Antigenic Activity of Dry Glucose BCG Vaccine. KONRAD BIRKHAUG, M.D.

Use of BCG in Mexico. ALBERTO P. LEON, M.D.

Problem of Standardization of BCG Vaccine. JOSEPH D. ARONSON, M.D., AND PATRICIA SCHNEIDER.

Use of 23 Per cent Trisodium Phosphate in the Concentration of Material for the Acid-Fast Bacilli. BEATRICE D. LARNER, D.SC.

Methodology in Laboratory Diagnosis of Tuberculosis. JOHN ABBOTT, M.D.

A New Medium for Practical Bacteriological Diagnosis of Tuberculosis. LEONORE R. PEIZER.

THURSDAY, 9:30 A.M.

MERIT SYSTEM SERVICE

First Session—Parlor 2, Hotel Statler

Presiding: CHARLES B. FRASHER.

EXAMINING THE EXAMINATION

Panel Discussion

Representing Viewpoints of:

Agencies Using Examinations. (Speaker to be announced.)

Scientific Test Development. SIDNEY H. NEWMAN, PH.D.

Health Officers. WILTON L. HALVERSON, M D.

Schools of Public Health. GAYLORD W ANDERSON, M.D.

The Examinee. MARY E. PARKER, R.N.

Fiscal Officers. WILLIAM R. PEEBLES.

Discussants:

LILLIAN D. LONG, PH.D.

FRED S. BEERS.

PUBLIC HEALTH EDUCATION SECTION

Second and Third Sessions—Grand Ballroom, Hotel New Yorker

Presiding: A. HELEN MARTIKAINEN, *Chairman.*

PROBLEMS OF COMMUNITY ORGANIZATION AND HEALTH EDUCATION

An all day workshop session for the discussion of the philosophies and practices of health education specialists in urban and rural communities.

Discussion leaders and consultants to be announced.

Small groups may be assigned to the following rooms for discussion of specialized problems:

East Room and Room 424

Parlors E and H

THURSDAY, 12:30 P.M.

DENTAL HEALTH SECTION

Luncheon Session—Parlor 2, Hotel Statler

Presiding: PHILIP E. BLACKERBY, JR., D.D.S., *Chairman.*

Dental Health Activities in Norway. GUTTORM TOVERUD, PH.D.

THURSDAY, 12:30 P.M.

INDUSTRIAL HYGIENE SECTION

Luncheon Session—Parlor 1, Hotel Statler

Presiding: WILLIAM G. FRLDRICK, SC.D., *Chairman.*

The Thirty-fifth Anniversary of the Industrial Hygiene Section. WILLIAM G. FREDRICK, SC.D.

Section Business.

PUBLIC HEALTH NURSING SECTION

Luncheon Session—North Ballroom, Hotel New Yorker

Presiding: RUTH FREEMAN, R.N., *Chairman.*

THURSDAY, 2:30 P.M.

DENTAL HEALTH, MEDICAL CARE AND PUBLIC HEALTH NURSING SECTIONS

Joint Session—Penn Top, Parts 1 and 2, Hotel Statler

Presiding: MARGARET H. JEFFREYS, EDWIN F. DAILY, M.D., AND EMILIE SARGENT, R.N.

THE BRITISH NATIONAL HEALTH SERVICE

The First Year's Experience. A. LESLIE BANKS, M.D.

The General Practitioner Service. JOSEPH S. COLLINGS, M.D.

The Medical Profession and the Service. J. T. RICE-EDWARDS, M.D.

The Role of the Health Officer. J. A. SCOTT, M.D.

Discussants:

ALMA HAUPT, R.N.

PHILIP E. BLACKERBY, JR., D.D.S.

GEORGE BUGBEE

HUGH R. LEAVELL, M.D.

LOUIS H. BAUER, M.D.

ENGINEERING SECTION AND THE INTER-AMERICAN ASSOCIATION OF SANITARY ENGINEERING

Joint Session—Keystone Room, Hotel Statler

Presiding: CHARLES L. SENN AND CLARENCE I. STERLING, JR.

GLOBAL CONTROL OF INSECT VECTORS

Advancing Frontiers in Insect Control. JUSTIN M. ANDREWS, SC.D.

THURSDAY, 2:30 P.M.

ENGINEERING SECTION AND INTER-AMERICAN ASSOCIATION OF SANITARY ENGINEERING (Cont.

The Malaria Control Activities of WHO. PAUL F. RUSSELL, M.D.

Domestic Insect Vector Control in Venezuela. ARTURO L. BERTI, DR.ENG.

Anopheline Eradication in Sardinia. JOHN A. LOGAN, D.Sc.

Insect Vector Control Activities by the U. S. Public Health Service. FRANK TETZLAFF, C.E.

Fly Control Techniques. JOSEPH H. COFFEY AND PAUL P. MAIER.

EPIDEMIOLOGY, FOOD AND NUTRITION, HEALTH OFFICERS, AND STATISTICS SECTIONS

Joint Session—Salle Moderne, Hotel Statler

Presiding: JOHN J. PHAIR, M.D., FRANCES MACKINNON, STANFORD F. FARNSWORTH, M.D., AND FORREST E. LINDER, PH.D.

PROBLEMS OF AN AGING POPULATION

Multiphasic Screening Examinations—An Extension of Mass Case Finding Technique. LESTER A. BRESLOW, M.D.

Glaucoma, A Community Health Problem. FRANKLIN M. FOOTE, M.D.

(Title to be announced.) M. ALLEN POND.

Statistical Aspects of Current Research in the Cardiovascular Diseases. FELIX E. MOORE, JR., AND MARJORIE T. BELLOWS.

Nutrition and Dietary Habits of Aging Women. MARGARET A. OHLSON, PH.D.

INDUSTRIAL HYGIENE SECTION

Second Session—Parlor 1, Hotel Statler

Presiding: WILLIAM G. FREDRICK, SC.D., *Chairman.*

Atmospheric Comfort. CONSTANTIN P. YAGLOU.

Inter-society Coöperation in Industrial Hygiene. J. J. BLOOMFIELD.

Toxicity and Toxicology of Surface Active Agents. HEINRICH BRIEGER, M.D.

Administrative Practices in Industrial Hygiene. JAMES G. TOWNSEND, M.D.

Pneumoconiosis. LEONARD GREENBURG, M.D.

THURSDAY, 2:30 P.M.

LABORATORY SECTION

Fourth Session—Panel Room, Parlor A, Parlor C, Hotel New Yorker

WORKSHOPS

(A series of concurrent discussions)

Parlor C: Milk.

Discussion Leader: ARCHIE H. ROBERTSON, PH.D.

Parlor A: Biologic Products.

Discussion Leader: GEOFFREY EDSALL, M.D.

Panel Room: Enteric Disease, Serologic and 'phage Typing.

Discussion Leader: PHILIP R. EDWARDS, PH D.

MATERNAL AND CHILD HEALTH, PUBLIC HEALTH NURSING, AND SCHOOL HEALTH SECTIONS, AND THE AMERICAN SCHOOL HEALTH ASSOCIATION

Joint Session—Ballroom, Hotel Statler

Presiding: SARAH S. DEITRICK, M.D., RUTH FREEMAN, R.N., WARREN H. SOUTHWORTH, DR.P.H., AND GERTRUDE E. CROMWELL, R.N.

MENTAL HYGIENE IN THE CLASSROOM

A Demonstration of Teaching Procedures which Lead to Effective Human Relations in the Classroom.

The Delaware Human Relations Class Program. H. EDMUND BULLIS.

Seventh Grade Class Demonstration, Joan of Arc Junior High School, New York City. M. VIRGINIA MASON.

Panel Discussion

Moderator: (To be announced.)

Participants:

JOSEPH MERSAND, PH.D.

EMILY E. O'MALLEY.

N. H. DYER, M.D.

PAUL STEVENSON, M.D.

M. VIRGINIA MASON.

H. EDMUND BULLIS.

THURSDAY, 2:30 P.M.

PUBLIC HEALTH EDUCATION SECTION

Grand Ballroom, Hotel New Yorker

CONTINUATION OF WORKSHOP ON "PROBLEMS OF COMMUNITY ORGANIZATION AND HEALTH EDUCATION"

See page 1220

Small groups may be assigned to the following rooms for discussion of specialized problems:

East Room and Room 424

Parlors E and H

Parlor F

THURSDAY, 7:00 P.M.

SECOND GENERAL SESSION

Annual Banquet—Ballroom, Hotel Statler

Presiding: CHARLES F. WILINSKY, M.D., *President,* American Public Health Association.

Presidential Address. CHARLES F. WILINSKY, M.D.

Presentation of Forty Year Membership Certificates.

Announcement of New Officers, Resolutions.

Presentation of Sedgwick Memorial Medal Award.

Dancing. Refreshments. Informal.

FRIDAY, 9:30 A.M.

DENTAL HEALTH, MATERNAL AND CHILD HEALTH, MEDICAL CARE, AND PUBLIC HEALTH NURSING SECTIONS, AND THE AMERICAN SCHOOL HEALTH ASSOCIATION

Joint Session—Keystone Room, Hotel Statler

Presiding: PHILIP E. BLACKERBY, JR., D.D.S., HAROLD C. STUART, M.D., EDWARD S. ROGERS, M.D., MARGARET L. SHETLAND, R.N., AND VLADIMIR K. VOLK, M.D.

AMERICAN ACADEMY OF PEDIATRICS STUDY OF CHILD HEALTH SERVICES

Highlights of the Study and What They Mean for the Improvement of Child Health. JOHN P. HUBBARD, M.D.

Increasing the Teaching of Well Child Care in Pediatric Education. PAUL A. HARPER, M.D.

Joint Planning by the A.A.P. and the A.P.H.A. for the Development of School Health Services. THOMAS E. SHAFFER, M.D.

FRIDAY, 9:30 A.M.

DENTAL HEALTH, MATERNAL AND CHILD HEALTH, MEDICAL CARE, AND PUBLIC HEALTH NURSING SECTIONS, AND THE AMERICAN SCHOOL HEALTH ASSOCIATION (Cont.)

Public Health Nursing in Relation to Child Health Services. LUCILLE PEROZZI, R.N.

Dental Care for Children. JOHN T. FULTON, D.D.S.

A Demonstration Program for the Decentralization of Pediatric Education Services. GLIDDEN L. BROOKS, M.D.

General Discussion. WARREN R. SISSON, M.D.

ENGINEERING, FOOD AND NUTRITION, HEALTH OFFICERS, INDUSTRIAL HYGIENE, PUBLIC HEALTH EDUCATION, PUBLIC HEALTH NURSING, AND STATISTICS SECTIONS, AND CONFERENCE OF STATE SANITARY ENGINEERS

Joint Session—Ballroom, Hotel Statler

Presiding: M. ALLEN POND, WILLIAM H. SEBRELL, JR., M.D., STANFORD F. FARNSWORTH, M.D., WILLIAM G. FREDRICK, SC.D., DONALD A. DUKELOW, M.D., RUTH FREEMAN, R.N., FORREST E. LINDER, PH.D., AND W. W. TOWNL.

THE HEALTH OFFICER CALLS A STAFF CONFERENCE

Panel Discussion

Health Officer. HENRY F. VAUGHAN, DR.P.H.

Health Education MARY H. PARKS.

Engineering. HERBERT M. BOSCH.

Public Health Nursing. DOROTHY WILSON.

Food and Nutrition. ALICE H. SMITH.

Statistics. OSWALD K. SAGEN, PH.D.

Industrial Hygiene. KENNETH E. MARKUSON, M.D.

FRIDAY, 9:30 A.M.

EPIDEMIOLOGY SECTION

Third Session—Parlor 1, Hotel Statler

Presiding: JOHN J. PHAIR, M.D., *Chairman.*

The Serological Response in Brill's Disease. ROSS GAULD, M.D., HARRY A. FELDMAN, M.D., AND MERRILL J. SNYDER.

A Report on the Recent Outbreak of Jungle Yellow Fever in Panama. K. O. COURTNEY, M.D.

The Hemolytic Streptococcal Carrier State and Its Relation to Illness in Families. A. E. FELLER, M.D., GEORGE F. BADGER, M.D., JOHN H. DINGLE, M.D., RICHARD G. HODGES, M.D., WILLIAM S. JORDAN, JR., M.D., AND CHARLES H. RAMMELKAMP, JR., M.D.

Attack Rates Among Immigrants to Infested Human Populations. JOHANNES IPSEN, M.D.

Expectancy for Outbreaks of Poliomyelitis in Schools and Camps. THEODORE H. INGALLS, M.D., AND A. DANIEL RUBENSTEIN, M.D.

Preliminary Report of Epidemiological Studies on Poliomyelitis: Lansing Neutralizing Antibody and Antistreptolysin O Surveys of California Cities, Mexico, Pacific Islands, and the Far East. WILLIAM McD. HAMMON, M.D., GLADYS E. SATHER, AND NELL HOLLINGER, PH D.

LABORATORY SECTION

Fifth Session—Parlor 2, Hotel Statler

Presiding: HOWARD J. SHAUGHNESSY, PH D., *Chairman.*

ENTERIC DISEASE AND SANITATION

Transmission of Salmonella Infections. ERWIN NETER, M.D.

Field Trial of *Sh. flexneri III* Vaccine: Preliminary Report of Cultural Results. COMMANDER L. A. BARNES, M.S.C., AND R. C. DURANT.

Active Immunization Against Typhoid with the Hypospray Injector. HERBERT C. BATSON, PH.D., MAURICE LANDY, PH.D., AND ROBERT L. WALL.

A Comparative Study of the Media for the Detection of Streptococci in Water and Sewage. WALTER L. MALLMANN, PH.D., AND EDWARD B. SELIGMANN, JR.

Use of Enzyme Chymotrypsin for the Detection and Estimation of Residual Chlorine in Drinking Water. JOHN WYLLIE, M.D.

FRIDAY, 12:30 P.M.

MEETING OF ALL SECTION COUNCILS WITH THE EDITORIAL BOARD

Luncheon Session—Parlor 1, Hotel Statler

FRIDAY, 2:30 P.M.

ENGINEERING, EPIDEMIOLOGY, INDUSTRIAL HYGIENE, AND SCHOOL HEALTH SECTIONS, AND THE AMERICAN SCHOOL HEALTH ASSOCIATION

Joint Session—Grand Ballroom, Hotel New Yorker

Presiding: M. ALLEN POND, JOHN J. PHAIR, M.D., WILLIAM G. FREDRICK, SC.D., WARREN H. SOUTHWORTH, DR.P.H., AND DAVID A. VAN DER SLICE, M.D.

AIR SANITATION

Investigation of an Unusual Smog Incident in Donora, Pennsylvania, and Vicinity. JAMES G. TOWNSEND, M.D.

The Transmission of Hemolytic Streptococcal Infections in Infants' Wards with Special Reference to "Skin Dispersers." CLAYTON G. LOOSLI, M.D., MARGARET H. D. SMITH, M.D., JEWEL CLINE, AND LOIS NELSON.

Factors of Importance in the Use of Triethylene Glycol Vapor for Aerial Disinfection. WILLIAM LESTER, JR., M.D., O. H. ROBERTSON, M.D., SAUL KAYE, AND EDWARD W. DUNKLIN.

Penetration and Retention of Particulate Matter in Human Lungs in Relation to Particle Size. JACK H. BROWN, PH.D., KENNETH M. COOK, F. GREGG NEY, AND THEODORE F. HATCH.

The Present Status of the Control of Airborne Infections. Report of the Subcommittee on Air Sanitation of the Committee on Research and Standards. HOLLIS S. INGRAHAM, M.D.

FOOD AND NUTRITION SECTION

Third Session—Panel Room, Hotel New Yorker

Presiding: MARGARET C. MOORE, *Vice-Chairman.*

SOME PUBLIC HEALTH IMPLICATIONS OF THE STATE OF NUTRITION DURING PREGNANCY

Some Consideration in the Appraisal of Nutrition During Pregnancy. WILLIAM J. DARBY, M.D.

Relationship between Nutrition and Pregnancy as Observed in Recent Surveys in Newfoundland. GRACE A. GOLDSMITH, M.D.

Problems and Methods in Nutrition Services for Pregnant Women. BERTHA S. BURKE.

Discussion.

FRIDAY, 2:30 P.M.

HEALTH OFFICERS SECTION

Second Session— Penn Top, Part 1, Hotel Statler

Presiding: STANFORD F. FARNSWORTH, M.D., *Chairman.*

NEW LEGISLATION—EFFECTS UPON PUBLIC HEALTH PRACTICES

New Horizons in Hospital Planning. MARCUS D. KOGEL, M.D.

California's State Aid Program for Local Health Service. WILTON L. HALVERSON, M.D., AND ELLIS D. SOX, M.D.

Federal Health Legislation. ELTON D. WOOLPERT.

(Other speakers to be announced.)

LABORATORY SECTION

Sixth Session—East Room and Room 424, Hotel New Yorker

Presiding: HOWARD J. SHAUGHNESSY, PH.D., *Chairman.*

Experience with Gladstone Gelfoam Biopsy Procedure in Routine Tumor Diagnosis. ALFRED ANGRIST, M.D., AND ANN POLLAK, M.D.

Streptomycin in the Treatment of Meningitis Due to *H. Influenzae.* EMANUEL APPLEBAUM, M.D.

The Relative Stability of Schick and Dick Reactions. IRWIN S. NEIMAN, M.D.

Experimental Data Preceding and Following Ultraviolet Installation at Battey State Tuberculosis Hospital. H. M. VANDIVIERE, EARL J. SUNKES, D.P.H., AND C. EDWIN SMITH.

Bacteriological Aspects of the Study of Ultraviolet Irradiation in Large Central Rural Schools. HAZEL V. ROBERTS.

Mold Control by Germicidal Ultraviolet Energy. MATTHEW LUCKIESH, D.Sc., A. H. TAYLOR, THOMAS KNOWLES, AND E. T. LEPPELMEIER.

MATERNAL AND CHILD HEALTH AND PUBLIC HEALTH NURSING SECTIONS

Joint Session—Salle Moderne, Hotel Statler

Presiding: KATHERINE BAIN, M.D., AND RUTH FREEMAN, R.N.

TRENDS IN MATERNITY CARE

Natural Childbirth. HERBERT THOMS, M.D.

A Blueprint for Changing Concepts in Antepartum Care. EDWIN M. GOLD, M.D., HELEN M. WALLACE, M.D., AND MARGARET A. LOSTY, R.N.

Implications of New Ideas in Maternity Care for Public Health Nurses. MARION I. MURPHY, R.N.

Maryland Maternity Program. JOHN WHITRIDGE, JR., M.D.

FRIDAY, 2:30 P.M.

MEDICAL CARE AND STATISTICS SECTIONS

Joint Session—Penn Top, Part 3, Hotel Statler

Presiding: EDWARD S. ROGERS, M.D., AND FORREST E. LINDER, PH.D.

STATISTICAL ANSWERS TO ADMINISTRATIVE QUESTIONS IN MEDICAL CARE
ROUND TABLE

Moderator: EDWIN L. CROSBY, M.D.

What Are the Questions? DEAN W. ROBERTS, M.D., AND E. A. VAN STEENWYK.

How Can They Be Answered? A. W. HEDRICH, SC.D., AND MARGARET C. KLEM.

How Can Programs Be Appraised? E. RICHARD WEINERMAN, M.D.

PUBLIC HEALTH EDUCATION SECTION

Fourth Session—Parlors F and G, Hotel New Yorker

Presiding: A. HELEN MARTIKAINEN, *Chairman.*

MATERIALS CLINIC

A practical demonstration of the preparation and use of health education materials, sponsored by the Committee on Materials and Techniques.

Other Features of the Annual Meeting

In addition to a distinguished scientific program the 77th Annual Meeting offers many other things for the interest and information of delegates. The Technical Exhibitors, of whom there are more than 100, will bring them the latest information about products, services, and equipment available for use in modern public health practice. The Scientific Exhibit will depict for them current activities of national, state, and local official and non-official health agencies. The Association's Merit System Service, its Vocational Counselling and Placement Service, and its coöperative program with the National Health Council on Local Health Units will have consultation booths in the scientific exhibit area.

Health Education and Publicity Headquarters conducted for the Association by the National Publicity Council for Health and Welfare Services, will give delegates the opportunity to examine portfolios of materials on many subjects—venereal disease, tuberculosis, cancer, heart ailments, infantile paralysis, dental health, industrial health, eye health, mental health, accident prevention, sanitation, nutrition—to mention only a few. Portfolios on annual reports, bulletins, booklets, exhibits, radio, health cartoons and comics will also be included. This assemblage of significant health education materials from all parts of the country is regarded by numerous regular attendants at Association Annual Meetings as one of their most valuable features. At Boston last year one man came daily to the Headquarters when it opened at 8:30 A.M. and remained until it closed at 6:00 P.M, systematically going through the portfolios and taking copious notes. He said he spent a week torn by inner conflict—the scientific sessions or Health Education Headquarters—but the Headquarters won. Because the wish for them was expressed at previous meetings, this year lists of new health films and a bibliography of health education literature will be distributed.

The Motion Picture Theater, another favorite project with many delegates, will be operated by Mr. Thomas A. Stowell. Here all day long and every day during the convention, the newer health films may be viewed. And every day there will be a different program.

A demonstration of television techniques sponsored by the Committee on Motion Pictures of the Public Health Education Section will take place on Wednesday afternoon in a Broadway theater. This should concern everyone who has any responsibility for informing the public in health matters.

Of special interest is the extensive list of scientific trips planned by the New York Committee, many of which will include good old-fashioned sightseeing opportunities as well. The need for relaxation and entertainment will not be overlooked by the Committee nor will it fail to pay ample and generous attention to wives of delegates.

The 6 day post-convention trip to Bermuda, with two and one half days in the Islands, sponsored by the Association, is the perfect way to wind up the 77th Annual Meeting. (See the August JOURNAL, page 1068, for full details of the trip.)

Please note that the "Queen of Bermuda" leaves the Island at 3:00 P.M. November 2 and arrives in New York at 9:00 A.M. November 4.

THE 77TH ANNUAL MEETING

New York, N. Y., October 24–28, 1949

Hotel Reservation Form

Hotels	*Rooms with Bath*	
	Singles	*Doubles*
Belmont Plaza	$4.00–$7.00	$6.00–$9.00

Col. William L. Wilson, M.C. (M.D., M.P.H.), Special Assistant for Civil Health Affairs to the Surgeon General, U. S. Army, Washington, D. C.

Alfred Yankauer, Jr., M.D., M.P.H., District Health Officer, City Dept. of Health, New York, N. Y.

Laboratory Section

Isadore R. Asen, B.S., Director, The Clinical Laboratory, Newark, N. J.

Cooper Brougher, Jr., B.Sc., Administrative Director of Laboratories, State Dept. of Public Health, Nashville, Tenn.

G. John Buddingh, M.D., Professor of Microbiology, School of Medicine, Louisiana State University, New Orleans, La.

Lillian Buxbaum, B.A., Senior Bacteriologist, City Dept. of Hospitals, New York, N. Y.

George M. Cameron, Ph.D., Director of Laboratories, State Dept. of Public Health, Nashville, Tenn.

Shih L. Chang, M.D., Dr.P.H., Assistant Professor of Sanitary Biology, Harvard University, Cambridge, Mass.

Herald R. Cox, Sc.D., Director of Viral Research, Lederle Laboratories, Pearl River, N. Y.

Floyd H. Eggert, M.S., Director of Laboratories, U. S. Standard Products Co., Woodworth, Wis.

John E. Faber, Jr., Ph.D., Professor and Head, Dept. of Bacteriology, University of Maryland, College Park, Md.

Frances I. Friewer, A.B., Bacteriologist, State Dept of Public Health, Chicago, Ill.

B. Scott Fritz, V.M.D., Director, Biological Laboratories, Wyeth, Inc., Marietta, Pa.

Helen H. Gillette, S.B., Chief Diagnostic Laboratory, State Dept. of Public Health, Jamaica Plain, Mass.

Irving Gordon, M.D., Associate Medical Bacteriologist, Division of Laboratories and Research, State Dept. of Health, Albany, N. Y.

Angus M. Griffin, Ph.D., Associate Professor of Bacteriology, Hygiene and Preventive Medicine, School of Medicine, George Washington University, Washington, D. C.

William M. Hale, M.D., Professor and Head, Dept. of Bacteriology, College of Medicine, State University of Iowa, Iowa City, Ia.

Laura G. Jacques, M.D., Director, Division of Diagnostic Laboratories, State Dept. of Health, Concord, N. H.

J. Emerson Kempf, M.D., Associate Professor, College of Medicine, University of Illinois, Chicago, Ill.

Sidney O. Levinson, M.D., Executive Director, Michael Reese Research Foundation and Samuel Deutsch Serum Center, Chicago, Ill.

Thomas B. Magath, M.D., Ph.D., Chief, Clinical Laboratories, Mayo Clinic, Rochester, Minn.

Viola M. Michael, Ph.D., Bacteriologist-in-Charge, Branch Laboratory, State Dept. of Public Health, Champaign, Ill.

Ruth E. Miller, Ph.D., Professor of Bacteriology, Woman's Medical College of Pennsylvania, Philadelphia, Pa.

Seward E. Miller, M.D., Chief, Laboratory Division, Communicable Disease Center, Public Health Service, Federal Security Agency, Atlanta, Ga.

Albert Milzer, M.D.. Ph.D , Director of Bacteriology and Virology Dept., Michael Reese Hospital, Chicago, Ill.

Roland B. Mitchell, Ph.D., Chief, Dept. of Aero-Biology, U.S.A.F. School of Aviation Medicine, Randolph Field, Tex.

Janie F. Morris, M.Sc., Bacteriologist, State Dept. of Public Health, Atlanta, Ga.

Irwin S. Neiman, M.D., Ph.D., Professor and Chairman, Dept. of Bacteriology and Public Health, Chicago Medical School, Chicago, Ill.

John M. Newell, D.Sc., Senior Chemist, Antitoxin and Vaccine Laboratory, State Dept. of Public Health, Jamaica Plain, Mass.

Isadore Pilot, M.D., Associate Professor of Medicine. University of Illinois, and Director of Laboratories, Edgewater and Lutheran Deaconess Hospitals, Chicago, Ill.

Joseph C. Register, Professional Liaison Officer, State Board of Health, Jackson, Miss.

William Reiner-Deutsch, Ph.D., Director, Industrial Testing Laboratories, New York, N. Y.

Henry W. Schoenlein, M.S., Director, Dept. of Bacteriology, Difco Laboratories. Detroit, Mich.

S. P. Sinha, M.B., M.P.H., Superintendent, Government Vaccine Institute, Bihar Public Health Service, Namkum, India.

John M. Slack, Ph.D., Associate Professor and Head, Dept. of Bacteriology and Public Hygiene, Medical School, West Virginia University, Morgantown, W. Va.

Joseph E. Smadel, M.D., Scientific Director, Dept. of Virus and Rickettsial Diseases, Army Medical Dept. Research and Graduate School, Washington, D. C.

W. Whitney Smith, Ph.D., Professor and head, Dept. of Bacteriology and Public Health, State Agricultural College, Logan, Utah.

Gustav I. Steffen, Ph.D., Director, Bureau of Laboratories, City Dept. of Health. New York, N. Y.

George I. Wallace, Ph.D., Associate Professor of Bacteriology, University of Illinois, Urbana, Ill.

Emory L. Webb, A.B., Associate Director, Division of Laboratories, State Dept.of Public Health, Atlanta, Ga.

Daniel Widelock, Ph.D., Assistant Director, Bureau of Laboratories, City Dept. of Health, New York, N. Y.

Statistics Section

Isidore Altman, M.S., Biostatistician, Public Health Service, Federal Security Agency, Washington, D.C.

Huldah Bancroft, Ph.D., Professor of Biostatistics, School of Medicine, Tulane University, New Orleans, La.

Wilbur V. Charter, D.P.H., Deputy Director, Medical Statistics Division, U. S. Navy, Washington, D. C.

Antonio Ciocco, D.Sc., Professor of Biostatistics, School of Public Health, University of Pittsburgh, Pittsburgh, Pa.

Bernard M. Cohen, Ph.D., Statistician in charge of Record Follow-up Studies, Committee on Veterans Medical Problems, Division of Medical Sciences, National Research Council, Washington, D. C.

William M. Haenszel, M.A., Director, Bureau of Vital Statistics, State Dept. of Health, Hartford, Conn.

Lt. Col. Eugene L. Hamilton, Director, Medical Statistics Division, Office of the Surgeon General, Dept. of the Army, Washington, D. C.

Albert P. Iskrant, M.A., Principal Statistician, Public Health Service, Federal Security Agency, Washington, D. C.

Frank V. Jones, Jr., M.P.H., Senior Public Health Analyst and Associate Statistician, State Dept. of Public Health, Sacramento, Calif.

Mary A. Ross, Ph.D., Chief, Public Health Section, Dominion Bureau of Statistics, Ottawa, Ont., Canada

Antoine B. Valois, M.D., M.P.H., Demographer and Superintendent, Division of Vital Statistics, City Dept. of Health, Montreal, Que., Canada

Irvin R. Vaughn, B.A., Director, Public Health Statistics Section, State Board of Health, Seattle, Wash.

P. K. Whelpton, B.S., Associate Director, Scripps Foundation for Research in Population Problems, Miami University, Oxford, Ohio

Engineering Section

George S. Bote, Typhus Control Specialist, Public Health Service, Federal Security Agency, Washington, D. C.

J. Robert Cameron, M.P.H., Acting Director, Sanitation Division, Bureau of Health and Hospitals, Denver, Colo.

Richard F. Clapp, M.P.H., Sanitarian (R), Public Health Service, Federal Security Agency, Columbus, Ga.

Gilbert H. Dunstan, M.S., Sanitary Engineer, Public Health Service, Federal Security Agency, Washington, D. C.

Charles A. Farish, M.P.H., Principal Sanitary Engineer, State Board of Health, Columbia, S. C.

John C. Geyer, Dr.Eng., Associate Professor of Sanitary Engineering, Johns Hopkins University, Baltimore, Md.

William C. Gibson, B.S.C.E., Training Specialist, Public Health Service, Federal Security Agency; Educational Director, Sanitation Field Training, University of North Carolina, Chapel Hill, N. C.

Wesley E. Gilbertson, M.S.P.H., Executive Officer, Communicable Disease Center, Public Health Service, Federal Security Agency, Atlanta, Ga.

Stafford W. Graydon, M.A., Public Health Engineer, City Health Dept., Atlanta, Ga.

Richard S. Green, S.M., Senior Sanitary Engineer, Public Health Service, Federal Security Agency, Washington, D. C.

Mark D. Hollis, C.E., Assistant Surgeon General and Chief, Sanitary Engineering Division, Public Health Service, Federal Security Agency, Washington, D. C.

Malcolm C. Hope, M.S., Sanitary Engineer, Public Health Service, Federal Security Agency, Washington, D. C.

Herman A. Janzen, B.S.C.E., District Engineer, State Board of Health, Dodge City, Kans.

Emil C. Jensen, M.S., Chief, Division of Public Health Engineering, State Dept. of Health, Seattle, Wash.

Lt. Col. Raymond J. Karpen, M.S.C., (M.S.), Sanitary Engineer, Office of the Surgeon General, Dept. of the Army, Washington, D. C.

William A. Legwen, M.S., Sanitary Engineer (R), Public Health Service, Federal Security Agency; Assistant State Director of Malaria Control, State Dept. of Public Health, Atlanta, Ga.

Karl M. Mason, M.P.H., Director, Division of Sanitation, City Dept. of Health, Peoria, Ill.

Cyril P. Maughan, B.S., Senior Sanitarian, State Dept. of Public Health, Boise, Idaho

Dwight F. Metzler, C.E., Chief Engineer, State Board of Health, Lawrence, Kans.

Paul W. Purdom, B.S.C.E., Principal Sanitary Engineer, City Bureau of Health, Knoxville, Tenn.

Charles B. Ruegnitz, M.S.P.H., Director, Division of Sanitation, Almeda County Health Dept., San Leandro, Calif.

William W. Sampson, Ph.D., Instructor in Public Health, School of Public Health, University of California, Berkeley, Calif.

Charles D. Spangler, Ph.D., Sanitary Engineer, Public Health Service, Federal Security Agency, Columbus, Ga.

Stanley B. Stolz, B.S., Sanitary Engineer, City Dept. of Public Health, New Rochelle, N. Y.

George E. Symons, Ph.D., Associate Editor, Water and Sewage Works, Gillette Publishing Co., New York, N. Y.

Meredith H. Thompson, Dr.Eng., Director, Environmental Hygiene, Rensselaer County Dept. of Health, Troy, N. Y.

Emil A. Tiboni, M.P.H., S.A., Sanitarian (R), Public Health Service, Federal Security Agency, Washington, D. C.

Ralph J. Van Derwerker, B.Sc., Chief Sanitary Engineer, Pan American Sanitary Bureau, Washington, D. C.

Frank L. Woodward, M.P.H., Director, Division of General Sanitation, State Dept. of Health, Minneapolis, Minn.

Industrial Hygiene Section

Herman J. Bennett, M.D., M.P.H., Associate Physician, New York State Workmen's Compensation Board, New York, N. Y.

Robert M. Brown, M.P.H., Instructor in Public Health, Institute of Occupational Medicine and Hygiene, Dept. of Public Health, Yale University, New Haven, Conn.

Harry Heimann, M.D., Industrial Hygiene Consultant, Public Health Service, Federal Security Agency, New York, N. Y.

Warren H. Reinhart, M.S., Acting Chief, Industrial Hygiene Section, State Health Dept., New Orleans, La.

Abraham Wallach, M.S., Director, Division of Industrial Hygiene, State Board of Health, Helena, Mont.

Food and Nutrition Section

Virginia A. Beal, M.P.H., Nutritionist, Child Research Council, Denver, Colo.

Elizabeth K. Caso, M.S., Instructor in Nutrition, School of Public Health, Harvard University, Boston, Mass.

Ancel Keys, Ph.D., Professor and Director, Laboratory of Physiological Hygiene, University of Minnesota, Minneapolis, Minn.

Henry R. Kraybill, Ph.D., Director of Research and Education, American Meat Institute Foundation, Chicago, Ill.

Catherine M. Leamy, M.S., Regional Nutri-

tion Consultant, Children's Bureau, Federal Security Agency, New York, N. Y.

Anne R. Matthews, M.P.H., Chief Nutritionist, State Dept. of Health, Baltimore, Md.

Marjorie M. Morrison, M.S., Nutrition Consultant, State Board of Health, Jacksonville, Fla.

Fred W. Morse, Jr., M.D., M.P.H., Assistant Chief, Nutrition Branch, Public Health Service, Federal Security Agency, Washington, D. C.

Dorothea E. Nicoll, M.S., Supervisor of Nutrition, State Dept. of Public Health, Boston, Mass.

Harold B. Pierce, Ph.D., Professor of Biochemistry, University of Vermont, Burlington, Vt.

Herbert Pollack, M.D., in Private Practice and Chief, Metabolism Service, Mt. Sinai Hospital, New York, N. Y.

Ethel M. Potteiger, M.S., Senior Nutritionist, State Dept. of Health, Albany, N. Y.

Mary A. Ross, M.A., Assistant Director, Nutrition Bureau, Community Service Society, New York, N. Y.

John M. Sharf, Ph.D., Chief of Closure Research, Armstrong Cork Co., Lancaster, Pa.

Frances N. Shoun, M.S., Nutrition Consultant, State Dept. of Public Health, Nashville, Tenn.

Horace L. Sipple, Ph.D., Director of Research and Education, Evaporated Milk Assn., Chicago, Ill.

Martha F. Trulson, M.P.H., Nutritionist, Rheumatic Fever Research Institute, Northwestern University, Chicago, Ill.

Helen E. Walsh, M.A., Supervising Nutritionist, State Dept. of Public Health, San Francisco, Calif.

Maternal and Child Health Section

Donald J. Bourg, M.D., Regional Medical Director, Children's Bureau, Federal Security Agency, Denver, Colo.

Sidney S. Chipman, M.D.C.M., M.P.H., Associate Professor of Pediatrics, Louisiana State University and Associate in Pediatrics, State Dept. of Health, New Orleans, La.

George M. Cooper, M.D., Sr., Assistant State Health Officer and Director, Division of Maternal and Child Health and Crippled Children, State Board of Health, Raleigh, N. C.

Anita E. Faverman, M.D., M.P.H., Assistant Chief, Bureau of Maternal and Child Health, State Dept. of Public Health, San Francisco, Calif.

Robert E. Jewett, M.D., M.S.P.H., Director of Maternal and Child Health, State Board of Health, Indianapolis, Ind.

Frederic M. Kriete, M.D., Chief, Bureau of Maternal and Child Health, State Dept. of Public Health, San Francisco, Calif.

Eva Landsberg, M.D., M.P.H., Director, Division for Physically Handicapped Children, City Dept. of Health, New York, N. Y.

Ella Langer, M.D., Director of Maternal and Child Health and Services for Crippled Children, State Dept. of Health and Welfare, Augusta, Me.

Amadeo Vicente-Mastellari, M.D., Director, Anti-Tuberculosis Campaign, Dept. of Health, Panama, Republic of Panama

A.P.H.A. membership application blank on page XXXVII

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

Charles H. Dowding, Jr., M.D., 831 Cherry, Denver, Colo., Asst. Health Officer, Weld County Health Dept.

Samuel S. Fischoff, M.D., 1261 Eastern Parkway, Brooklyn, N. Y., Diagnostician, Contagious Diseases, New York City Health Dept.

Luis F. Galich, M.D., Av. Orantes 8, Guatemala, Guatemala, C. A., Director General, Sanidad Publica

William A. Harris, M.D., 25 Greenwood Place, Potomac Heights, Indian Head, Md., Deputy State and County Health Officer, Charles County, State Health Dept.

Martin D. Hicklin, M.D., Health Center, Burlington, Ia., Medical Director, District 9, State Dept. of Health

Norman R. Ingraham, Jr., M.D., Stanton & Whitemarsh, Chestnut Hill, Philadelphia 18, Pa., Chief, Division of Communicable Disease Control, Dept. of Public Health of Philadelphia

Raymond C. Leer, M.D., 1607 N. Flower St., Apt. B, Santa Ana, Calif., Medical Officer, Orange County Health Dept.

Jan Lieben, M.D., 27 Commerce St., Apt. 4B, New York, N. Y., Student, Harvard School of Public Health

J. Colin Lindsay, M.D., Ritzville, Wash., Adams County Health Officer

Joseph E. Malcomson, M.D., Health Office, South Boston, Va., Health Officer, Halifax County

Isamu Nieda, M.D., PHW-GHQ-SCAP, APO 500, San Francisco, Calif., Chief, Venereal Disease Control Branch, Public Welfare and Health Section

James J. Powers, M.D., LL.D., 495 Mammoth Road, Manchester, N. H., City Health Officer, Manchester Health Dept.

Felix S. Shubert, M.D., Dept. of Health, Erie, Pa., Health Director, City of Erie

Harry Strieb, M.D., M.P.H., 1826 W. Venango St., Philadelphia 40, Pa., Asst. Immunologist, City Dept. of Health

Boonchuay Subhamani, M.B., 615 N. Wolfe St., Baltimore 5, Md., Student in Public Health, Johns Hopkins Univ., School of Hygiene and Public Health

Edmond L. Whitfield, M.D., 64 East Broad St., West Point, Miss., Director, Clay County Health Dept.

Marion M. Young, M.D., Crossville, Tenn., Director, Cumberland County Health Dept.

Laboratory Section

John N. Abbott, M.D., Division of Laboratories and Research, State Dept. of Health, Albany, N. Y., Senior Pathologist

Libero Ajello, Ph.D., 605 Volunteer Bldg., Atlanta 3, Ga., Scientist, Mycology Section, Public Health Service, Communicable Disease Center

Anne Blevins, 303 E. 20th St., New York, N. Y., Bacteriologist, University Hospital

Sue M. Brandon, 12 Capitol Square, Atlanta, Ga., Supervisor of Routine Serology Laboratory, State Dept. of Public Health

Bernard A. Briody, Ph.D., 310 Cedar St., New Haven, Conn., Instructor in Bacteriology, Yale Univ. School of Medicine

Michael Charney, 173 Main St., Hackensack, N. J., Director, Hackensack Bio-Chemical Laboratory

Mabel Djang, M.S., Saginaw County Hospital Laboratory, Saginaw, W. S., Mich., Bacteriologist

Chester W. Emmons, Ph.D., National Institutes of Health, Bethesda 14, Md., Principal Mycologist, Public Health Service

Jack R. Fleenor, 3410 Selma Ave., Knoxville, Tenn., Student, Univ. of Tennessee

C. E. Goulding, Ph.D., 3209 Barcelona Ave., Tampa 9, Fla., Consulting Engineer and Chemist

George G. Gralak, M.S., 217 North Gifford St., Elgin, Ill., Bacteriologist, Elgin State Hospital

Karl W. Hagen, Jr., 4957 W. 104th St., Inglewood, Calif., Bacteriologist, Chapman Chinchilla Research

George Heller, Ph.D., 325 E. 79th St., New York 21, N. Y., Chief of Microbiology Section of Clinical Laboratory, Veterans Administration Hospital

Steven Horoschak, 13 W. Hinckley Ave., Ridley Park, Pa., Medical Research, Medical Research Dept., National Drug Co.

Thomas P. Hughes, Ph.D., Rockefeller Foundation, 49 W. 49th St., New York 20, N. Y., Member, Field Staff International Health Division

William P. Jambor, Squibb Institute for Medical Research, New Brunswick, N. J., Research Asst.

Jean B. Jones, 464 Jackson Ave., Elizabeth, N. J., Medical Laboratory Technician, Newark City Hospital

Michael Kenney, M.D., 336 West End Ave., New York 23, N. Y., Bacteriologist and

Parasitologist, Clinic Laboratory, Veterans Hospital

Reginald J. Keys, Box 57, Lantana, Fla., Junior Asst., State Board of Health

Earl E. Long, M.S., 708 Municipal Bldg., Akron 8, Ohio, Director, Dept. of Health, Division of Laboratories

Emanuel E. Mandel, M.D., Public Health Service, 605 Volunteer Bldg., Atlanta, Ga., Senior Surgeon, in Charge, Clinical Pathology Section, Communicable Disease Center

Mary J. Martins, Merced County Health Dept., Merced, Calif., Public Health Laboratory Technician

Patricia Ann McDowell, Rt. 1, Box 349, Sumner, Wash., X-Ray and Laboratory Technician, Laurel Beach Sanatorium

Karin O. Miller, 1101 W. Marquette Rd., Chicago, Ill., Senior Bacteriologist, South District Filtration Plant

Robert B. Miller, 7520-A State St., Huntington Park, Calif., Medical Technician, Professional Laboratories of Los Angles

S. M. Papperman, 2415 St. Charles Ave., Apt. G., New Orleans 13, La., Graduate Student, Medical Bacteriology, Tulane Univ. of Louisiana

Donald C. Phillips, 116 Hickok Ave., Syracuse 6, N. Y.

Harold H. Plough, Ph.D., Amherst College, Biological Laboratory, Amherst, Mass., Professor of Biology

Geoffrey W. Rake, M.D., 745 5th Ave., New York, N. Y., Director of Squibb Institute, E. R. Squibb and Sons

Budd F. Rude, 129 Fremont Place, Los Angeles 5, Calif., Independent Research on Blood Diseases

Delester Sackett, 555 South St., Elgin, Ill., Bacteriologist, Elgin State Hospital

William A. Seleen, Ph.D., 350 Madison Ave., New York 62, N. Y., Research Bacteriologist, Borden Company

Miriam S. Shane, M.S., Board of Water Commissioners, 16th and Market, Wilmington 99, Del., Bacteriologist, Water Dept.

Janet Slease, M.S., Public Health Laboratories, Terrace & Darragh Sts., Pittsburgh 13, Pa., Bacteriologist, Pittsburgh Dept. of Public Health

Oscar Stern, 1004-S. 15th St., Mt. Vernon, Wash., Co-owner, Fostern Laboratories

Statistics Section

Kathern M. Clay, M.S., 620 S. Third St., Louisville 2, Ky., Statistician, State Dept. of Health

William G. Cochran, M.A., 615 N. Wolfe St., Baltimore 5, Md., Professor of Biostatistics, School of Hygiene and Public Health, Johns Hopkins Univ.

Naomi M. Drake, 507 Carondelet St., New Orleans, La., Deputy Registrar, Vital Records, New Orleans Health Dept.

APPOINTMENT OF ENGINEERING RESEARCH ASSOCIATE

The Executive Board of the American Public Health Association announces the appointment of Maurice A. Shapiro, M.Eng., as Engineering Research Associate on the staff of the Engineering Section Project. Mr. Shapiro began his assignment in June.

Mr. Shapiro was graduated with a degree in biology from The Johns Hopkins University in 1941. He also received a Master in Engineering degree from the University of California. He served for 6 years in the U. S. Public Health Service where his work included assignments with the Georgia State Department of Health, the Florida State Board of Health, and 2½ years overseas with the Sanitary Engineering Division of the UNRRA Yugoslav Mission. After release from active duty with the U. S. Public Health Service, Mr. Shapiro served as Field Officer with the United Yugoslav Relief Fund of America on its public health training and rehabilitation program in Yugoslavia.

A major interest of the Engineering Section is the development of the administrative procedures applicable to environmental sanitation. Funds have been made available through the Division of Research Grants and Fellowships of the Public Health Service for the purpose of conducting field research in several phases of administrative activities. Mr. Shapiro's duties will be in connection with nation-wide research on program evaluation, position classification, and a time study.

MAURICE A SHAPIRO

A.P.H.A. REPRESENTATIVE ON FOOD AND NUTRITION BOARD

The appointment of Norman Jolliffe, M.D., of New York City, as liaison member of the Food and Nutrition Board of the National Research Council representing the A.P.H.A., is jointly announced by Frank G. Boudreau, M.D., Chairman of the Board, and Hugh R. Leavell, M.D., Chairman of the Executive Board, A.P.H.A.

Dr. Jolliffe who is a Fellow of the Food and Nutrition Section was recently appointed Director of the Bureau of Nutrition of the New York City Department of Health.

All communications should be sent to Burneice Larson, Medical Bureau, Palmolive Building, Chicago 11, Ill.

Opportunities Available

WANTED—(a) Professor, or associate professor, health education; university school of health; Ph.D. or M.D.; thorough background of training in health education required; experience in public school work desirable. (b) Public health physician to serve as health commissioner; town of 75,000; staff of seventeen, well equipped offices, laboratory; Middle West. (c) Public health physician for administrative post, national health organization; someone qualified to carry considerable responsibility required; headquarters, university center. (d) Young woman physician to join staff of student health department; young women's college; East. (e) Physician to direct program, public school system; winter resort town of 165,000; Southwest. (f) Public health physician; city-county department; Pacific Northwest. (g) Student health director; university having enrollment, 9,000; excellent facilities for developing efficient program; well staffed department, university medical center, city of 600,000. PH9–1 Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

WANTED—(a) Assistant director of research; duties rather broad involving experimental work (physical and bacteriological studies), serving as consultant; degree in Sanitary Engineering or Public Health required; large manufacturing company. (b) Executive assistant; health organization; experience in public relations desirable; university center; Southeast. (c) Health educator; association of voluntary health agencies; new development; town of 40,000; Northeast. (d) Health educator and, also, health education consultant; state department of health; interesting opportunities. PH9–3 Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

WANTED—(a) Director, public health nursing program; graduate degree required; eastern university. (b) Public health and, also, junior public health nurses; newly created positions; county health department, California; salaries, $3,300–$3,840, $2,640–$3,100, respectively. (c) Director, visiting nurse association, to succeed director, 12 years' tenure; staff, 14; university town. Middle West. (d) Field nurse, educational health program; large industrial company; considerable traveling; Middle West. (e) School nurse; public school system; small town located on coast of California; duties directing school health program. (f) Several public health nurses; generalized public health program; semi-rural county near several large cities and university medical centers; Middle West. PH9–4 Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Opportunities Wanted

Public health administrator; M.S., M.D., M.P.H., eastern schools; several years, director of public health program, foreign country; eight years, professor of preventive medicine and public health; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago.

Dentist; qualified public health and children's dentistry; B.A., D.D.S., M.A., Ph.D., leading schools; year's residency in children's residency; teaching experience; research has been particularly concerned with administrative and educational problems in conection with children's dental programs in under-developed areas; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago.

Sanitarian; B.S., Civil Engineering; past eight years, sanitary engineer, metropolitan health department; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago.

Health educator; M.P.H., eastern university; past several years, health educator, consultant and coördinator of health education activities, public schools; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago.

Public health nurse seeks administrative position or teaching on university level; B.S., M.P.H.; several years, staff nursing; six years, director of nursing and health education, county health department; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

RECOMMENDED PRACTICES FOR THE CONTROL OF POLIOMYELITIS

A GROUP of persons representing all aspects of poliomyelitis control met recently at Ann Arbor, Mich., at the request of the National Foundation for Infantile Paralysis. To answer the needs frequently expressed by health officers, hospitals, physicians, and others for an up-to-date, authoritative reference and guide for meeting practically the many problems related to the control of poliomyelitis, this group agreed on the following recommendations, which have also been endorsed by the executive committee of the Association of State and Territorial Health Officers.

The group preparing these recommendations included Drs. Gaylord W. Anderson, Charles Armstrong, Albert E. Casey, Haven Emerson, Thomas Francis, Jr., Vlado A. Getting, A. L. Gray, William McD. Hammon. Dorothy M. Horstmann, Herbert R. Kobes, Kenneth S. Landauer, Kenneth F. Maxcy, Joseph C. Molner, Thomas M. Rivers, Joseph E. Smadel, Hulda E. Thelander, Franklin H. Top, James Watt, Harry M. Weaver, and James L. Wilson.

THE DISEASE

1. *Recognition of the disease.*
A highly prevalent infection of which only a small fraction of the cases is clinically identifiable. In its recognizable form an acute illness, usually febrile, with early varying symptomatology, but usually with headache and almost always a characteristic stiffness of neck and spine that justifies an examination of spinal fluid. In about half such cases a lower neurone paralysis develops in first few days of illness which shows a marked tendency for spontaneous improvement after it has reached its height. If first seen after acute stage has passed, diagnosis depends upon detection of a flaccid paralysis characteristically irregular in its involvement of muscle or muscle groups. Diagnosis in non-paralytic cases depends upon detection of a clinical picture compatible with the illness plus demonstration of moderate increase in cells in spinal fluid. A form of illness presumptively poliomyelitis (abortive) presenting only vague symptoms and without signs referable to the central nervous system is of frequent occurrence during epidemics.

2. *Etiologic agent.*
The poliomyelitis virus. Several immunologically distinct types have been identified.

3. *Source of infection.*
Pharyngeal and fecal discharges of infected persons, frequently those not suffering from a clinically recognized attack of the disease.

4. *Mode of transmission.*
Close association with infected persons accounts for the great majority of cases. Outbreaks attributable to milk have been rare and limited. Although flies have been found to be contaminated with the virus, there has been no reliable evidence of spread by insects, water, food or sewage.

5. *Incubation period.*
Usually 7 to 14 days. (May be from 3 to 35 days.)

6. *Period of communicability.*
Apparently the period of greatest communicability is covered by the latter part of the incubation period and the first week of the acute illness.

7. *Susceptibility and immunity.*
Susceptibility to infection is general. Immunity is acquired by infection which may have been clinically inapparent. The duration of immunity is unknown, but second attacks are rare.

8. *Prevalence.*
Infection is prevalent throughout the world. Paralytic cases have been apparently more frequent in the temperate zones. Occurs both sporadically and in epidemics at irregular intervals, with the highest incidence in summer and early fall. In the United States an annual incidence of 10 paralytic cases per 100,000 population is ordinary, but there is a wide variation in incidence from year to year and region to region. Children from 1 to 16 years of age are more frequently attacked than adults. In several countries, including the United States, older children and young adults constitute a

higher proportion of reported cases than formerly. Even during epidemics the incidence of paralytic cases has rarely exceeded one per thousand population.

9. *Methods of control.*

A. Preventive measures: None

B. The infected individual, contacts and environment:

1. Recognition of the disease and reporting: Clinical manifestations assisted by microscopic and chemical examination of the spinal fluid if lumbar puncture is performed. In reporting, paralytic or non-paralytic should be specified. A clear separation between these two groups of cases as reported permits a closer comparison of incidence between localities and with past experience.
2. Isolation: For one week from date of onset, or duration of fever if longer.
3. Concurrent disinfection: Nose and throat discharges and feces are infectious and should be disposed of as quickly and safely as possible. Articles soiled therewith should be promptly disinfected.
4. Terminal disinfection: None.
5. Quarantine: Quarantine of unproven value. Modified quarantine restricting the movement of intimate contacts for 7 to 14 days may be desirable in certain circumstances. (In Great Britain 21 days of exclusion from school of child contacts.)
6. Active immunization: None. Passive immunization is not recommended.
7. Investigation of sources of infection: Search for and expert diagnosis of sick children to locate unrecognized and unreported cases of the disease.

C. Epidemic measures:

1. General notice to physicians of the prevalence or increase of incidence of the disease, description of usual characteristics of onset and necessity for diagnosis and medical care, particularly for bed rest of patients, and information to the public at large on similar matters.
2. Isolation in bed of all children with fever, pending diagnosis.
3. Education in such technique of bedside nursing as will prevent distribution of infectious discharges to others from patients isolated at home.
4. Protection of children so far as practicable against unnecessary contact with persons other than their usual associates
5. Postponement of elective nose or throat operations or dental extractions.
6. Avoidance of excessive physical strain (e.g., violent exercise) in children during an epidemic or in case of known exposure.
7. Avoidance of unnecessary travel and visiting, especially of children, during high prevalence of the infection.

D. International measures: None.

THE PATIENT

1. *Reporting.*

All obvious and suspect cases should be promptly reported. As soon as possible all of these cases should be classified as paralytic or non-paralytic. Cases which are finally diagnosed as presumptive (abortive) poliomyelitis should not be included in the final tabulation of cases by the health officers. For guidance of health officers and physicians the following is proposed:

Diagnostic criteria of paralytic or non-paralytic poliomyelitis should generally include three or more of the following:

(1) history compatible with poliomyelitis
(2) fever
(3) stiff neck and/or stiff back
(4) 10 to 500 cells per ml. of spinal fluid taken during the acute or early convalescent period of the disease
(5) spinal fluid protein elevated above normal limits
(6) demonstrable muscle weakness or paralysis

Cases which present only (1) history compatible with poliomyelitis, and (2) fever, should be classified as presumptive (abortive) poliomyelitis.

Paralytic cases are defined as those in which definite weakness or paralysis has been detected and persisted during at least two examinations with an interval of at least several hours. Results of an examination for paralysis of muscles of the extremities or trunk may be very unreliable during the period of muscle tenderness or "spasm."

2. *Hospitalization.*

A. Admission to general hospital.

Patients with acute poliomyelitis, or presumed to have acute poliomyelitis, are admissible to a general hospital provided that appropriate isolation precautions are employed. No special isolation or "pest" facilities are necessary.

B. Nursing care.

During isolation, or hospitalization after the period of isolation, there is no need for a special duty nurse for each patient. Special duty nurses should be employed with regard only to the medical condition

of the patient, and to the number of patients they can properly handle.

C. Isolation technique in hospitals.

The isolation procedures used for the care of acute polimyelitis patients are similar to techniques used in the hospital care of other communicable diseases, namely:

1. Segregation of patients having the same disease, preferably in single rooms or small wards. Patients can be cared for in large wards.
2. Washing of linen in the hospital laundry. Ordinary precautions for handling articles from infected persons are sufficient.
3. Sterilization of eating utensils after use.
4. Availability of toilets or hoppers in each room, small ward or large ward.
5. Availability of hand washing facilities in each room, small ward or large ward.
6. Use of gowns by physicians when examining a patient and by nurses when caring for a patient, particularly while bedpanning.
7. Disposal of excreta of patients by placing in toilet or hopper as soon after passage as possible. The bed pan should be washed out if the utensil is used for a single patient, but when used in wards bed pans should be sterilized each time the utensil is used. No special treatment of feces from polio patients is necessary.
8. Hand washing with ordinary soap and water should be practised following examination of patients and after bedpanning a patient.

When toilet or hopper is situated outside the room or ward, a single pan should be covered, carried out and contents disposed of as above (7); multiple pans are best cared for by placing on a cart and transferred to the disposal unit and taken care of as above (7).

D. Care at home.

Patients may be cared for at home if home facilities and medically supervised care are adequate; or may be discharged to such home when there is no medical indication for further observation or treatment in the hospital.

Admission to or care in a hospital for isolation purposes only is not usually indicated.

E. Care of suspect cases.

It is recommended that suspect cases when admitted to a hospital should be segregated when possible from known cases until the diagnosis has been established or the patient is discharged as well.

F. Importation of patients.

In order that the best possible facilities be used for the care of cases of poliomyelitis, patients may be sent from their own home communities to a hospital in another community. The available evidence indicates that such importation of polio patients into a hospital in a community where poliomyelitis is not prevalent does not affect the incidence of the disease in the hospital community.

G. Transportation of patients.

Transportation of patients from one health jurisdiction to another may be carried out under proper conditions, such as transportation in an ambulance or a private vehicle. A common carrier should not be used. Transfer should be carried out with the knowledge and the consent of the health officers in the jurisdiction to and from which the patient is being transferred.

No special treatment of ambulances after their use by polio patients is necessary.

THE COMMUNITY

These recommendations were formulated with the emphasis on avoiding the possible effect of disturbing or altering unnecessarily the normal pattern of life in the community. Whatever is done to upset the usual routine of children in a household or adults in their occupations is likely to bring more trouble than good.

1. *Schools.*

Recommendation: Public and private schools should not be closed during an outbreak of poliomyelitis, nor their opening delayed, except as noted below:

Reason: The closing of schools, or the delay of their opening, has not affected the course of outbreaks of poliomyelitis; moreover, such action has often resulted in panic on the part of the public. The decision to open school as usual should be announced well in advance jointly by the superintendent of schools and the health officer, in collaboration with the local medical society. Early in the season the state departments of education and public health should issue a joint statement to which local authorities can refer for support. This statement should be issued in collaboration with the State Medical Society.

Exceptions:

1. Schools to which children are transported in buses from widely separated areas may be delayed in opening, if such action will prevent other close contacts among chil-

dren. If these schools are not opened, such action is justifiable only when other close contact among these children is not permitted in such places as theaters, picnics, playgrounds, swimming beaches or Sunday schools.

2. Boarding schools (excluding colleges and universities) should delay opening sessions if an outbreak of poliomyelitis exists in the area where the school is located and if the children are thus prevented from coming into the area from regions where the disease is not prevalent.
3. Nursery schools may be continued or closed depending upon the particular circumstances. Parents, if both are employed, may prefer to send their children to a nursery school. Parents who have facilities at home to limit contacts of young children with other children should be encouraged to keep pre-schoolers at home.

2. *Camps.*

Summer camps should be opened as usual if there is no outbreak of poliomyelitis in the area in which the camp is located.

Children should not be admitted from areas where an outbreak exists.

Inasmuch as there is no evidence that retention of children in camps where poliomyelitis exists leads to increased hazard, whereas dismissal from camps may lead to spread to other communities, it is further recommended that if a case of poliomyelitis occurs in a camp the following procedure be instituted:

1. Retention of all children and staff at the camp for 14 days after last contact with the case or until the usual closing date of camp.
2. Modified and supervised activity to prevent excessive exercise and undue mixing in group activities.
3. Careful medical check-up on all children daily.
4. Isolation of all children with fever or any suspicious signs and symptoms.
5. Discontinuance of admission of new children to camps in which poliomyelitis cases have been recently diagnosed.

Day camps should follow the same recommendations as those above pertaining to schools.

3. *Places of recreation and amusement.*

It is recommended that health officers do not take action to close or prevent the operation of places of recreation or amusement, such as fairs, circuses, theaters, swimming pools, or beaches, provided these are properly operated. However, the attendance of children at such places should be discouraged.

Any theoretical advantage that might be gained by closing such facilities is offset by the undesirable results of disruption of community life.

NEWS FROM THE FIELD

HOOVER COMMISSION MEDICAL ACTIVITIES REPORT TO THE CONGRESS

THE February issue of the *Journal* carried a summary of the report of the Task Force Committee on Federal Medical Services to the Commission on Organization of the Executive Branch of the Government, commonly known as the Hoover Commission. It is pertinent now to present a summary of the section on Medical Activities of the Commission's report to the Congress March, 1949.

For the immediate purpose of uniting the functions now in five major agencies so as to eliminate overlap, waste and inefficiency, and in order to achieve the critically necessary objectives to provide better medical care for the beneficiaries of the federal government's medical programs, to create a better foundation for training and medical service in the federal agencies, to reduce the drain of doctors away from private practice, to provide better organization for medical research, and to promote a better state of medical preparedness for war, *the Commission recommends:*

1. The establishment of a United Medical Administration into which would be consolidated most of the large-scale activities of the federal government in the fields of medical care, medical research, and public health (including preventive medicine).

In reaching the conclusion that medical services should be unified, the Commission had the aid of extensive surveys by its distinguished task forces on Medical Services and on the National Security Organization. The recommendations set forth in this report "are generally in accord with" the original task force reports. [Note: On this point some task force members disagree.]

The task force was instructed to base its original report on the premise that "the Commission will recommend a Cabinet Department embracing health, education and security." However, in view of the size of the medical operations of the federal government and the extreme dissimilarities among the activities which would have composed such a department, the task force was later requested to consider the advisability of placing medical service functions in a single agency. Its supplementary report favors a separate United Medical Administration.

The report further states that—

The advantages of unification of federal medical services include:

a. The general standard of Federal medical care would be improved.
b. There would be central supervision of the major Federal medical care, public health, and medical research activities.
c. Construction costs could be standardized and reduced.
d. Federal hospitals could be utilized to the fullest extent by eliminating present distinctions as to the particular types of beneficiaries for which each can care.
e. The medical manpower at the call of the Federal Government could be used to the fullest extent, and present deficits in skilled personnel could be greatly reduced.
f. The need for any draft of medical manpower in time of peace could be greatly lessened.
g. The cost of health and medical services would be clearly identified and known to Congress.
h. The facilities of private hospitals and the skills of physicians in private life and in the universities could be utilized far more effectively than they are now.

The Commission recommends:

2. That the Administrator of the United Medical Administration should be assisted by an advisory board, consisting of the Surgeons General of the Army and Navy, the Air Surgeon, and the Administrator of Veterans' Affairs or his representative. This board should advise the Administrator on policies.[1]

[Note: Public health is not represented on the Board.]

3. That an Administrator and three Assistant Administrators be appointed by the President with the advice and consent of the Senate. All other officials in the Administration should be appointed by the Administrator and due consideration should be given to the promotion of properly qualified personnel in the career service.

The Administrator should report directly to the President. He should be the ablest medical and health administrator whose services

[1] Chairman Hoover and a Commissioner dissent in providing that the board should be "advisory" only.

can be obtained by the Government. The Administration should be manned by career personnel drawn initially from the various agencies whose functions are recommended for transfer to the new United Medical Administration, supplemented by medical officers whom the armed services would have the right to detail for training and rotation. In addition, the Administration should utilize to the full medical personnel of proved competence in private practice and in the universities.

The Commission recommends:

4. That the functions, facilities, and the personnel for medical care of the following activities should be transferred to the United Medical Administration [2]:

   a. The general hospitals of the armed forces in the continental United States (except a medical center for each of the three services), and station hospitals (certain of which the Navy calls "dispensaries") in the continental United States, except those at outlying posts so located that other hospitals of the United Medical Administration would not be near enough to provide the care required.
   b. The hospital functions of the Veterans Administration *in toto,* including the outpatient services in the field offices of the Veterans Administration.
   c. The four nonmilitary hospitals in the Canal Zone.
   d. The hospitals of the Public Health Service.
   e. The functions, facilities, and personnel of the Public Health Service.

St. Elizabeths Hospital, now in the Federal Security Agency, should either be transferred to the District of Columbia or included in the new Administration.

Hospital functions which should not be transferred are those of the Bureau of Indian Affairs and of the Bureau of Prisons, the armed forces station hospitals, above excepted, and armed forces hospitals overseas, and other small hospital functions such as those incident to the operations of the Tennessee Valley Authority and the Atomic Energy Commission. The Indian and prison hospitals should, however, be assisted in procuring staff by professional personnel from the United Medical Administration.

The Commission recommends:

5. That Congress should define the beneficiaries entitled to medical care from the Government and prescribe how this care should be given.
6. That the present inconsistency in policy between the Federal hospital construction program and Federal aid to non-Federal hospitals under the Hill-Burton Act should be ended.
7. That control of medical policy in the armed services should be exercised by the Secretary of Defense.
8. That the United Medical Administration should give constant attention to necessary measures for national defense.

By giving continued attention to the wartime medical needs of the country, including the status and availability of medical personnel and the relative facilities of Government and civilian hospitals, the overwhelming shortage of doctors which war would create could be met by optimum utilization of those we have.

The Commission further recommends:

9. That medical and other technical personnel in the Administration should be on a career service basis.
10. That a survey should be made to determine the needs for emergency aid to medical schools.
11. That the highest priority in importance should be given to research, preventive medicine, public health and education.

[2] The Concluding Report of the Commission differs slightly in including the following item: Transferring to the agency the drug inspection activities of the Food and Drug Administration.

NATIONAL SANITATION CONFERENCE

On June 14 and 15, 1949, 85 persons attended a conference on a national sanitation program held under the auspices of the National Sanitation Foundation at the Michigan School of Public Health. The following 28 organizations concerned with problems of sanitation and health education were represented; the A.P.H.A. by 3 persons from each of 3 sections on Health Education, Public Health Engineering, and Public Health Administration:

American Association for Health, Physical Education and Recreation
American Association of Industrial Physicians and Surgeons
American Hospital Association
American Industrial Hygiene Association
American Institute of Planners
American Medical Association
American Public Health Association
American School Health Association

American Society of Civil Engineers
American Veterinary Medicine Association
American Water Works Association
Association of Schools of Public Health
Association of State and Territorial Health Officers
Conference of Municipal Public Health Engineers
Conference of Professors of Preventive Medicine
Conference of State and Provincial Public Health Laboratory Directors
Conference of State Directors of Health Education
Conference of State Sanitary Engineers
Federation of Sewage Works Associations
International Association of Milk and Food Sanitarians
National Association of Housing Officials
National Association of Sanitarians
National Committee of Health Council Executives
National Education Association of United States
National Health Council
National Organization for Public Health Nursing.
National Safety Council
United States Public Health Service

"Social sanitation as a way of life" was the predominating theme of the speakers, who included in addition to General Mark Hollis, U.S.P.H.S., Drs. Haven Emerson, Henry F. Vaughan, and Nathan Sinai, and Walter F. Snyder, Executive Director of the Foundation. Sanitation was defined as a quality of living expressed in a clean home, a clean farm, a clean business and industry, a clean neighborhood and a clean community.

A resolution was unanimously adopted to the effect that sanitation as a way of life, in addition to its accepted health benefits, has social, economic, psychologic and moral values as well. The full benefits of sanitation may be obtained only through the continuing and joint efforts of the total community. A further resolution declared the need for an expanded nation-wide sanitation program with efforts directed toward the development of community-wide educational programs placing special emphasis on individual and group participation. The conference requested that the National Sanitation Foundation, in collaboration with official and voluntary organizations and agencies, stimulate and further develop such a nation-wide sanitation program.

One of the discussion groups emphasized that local health departments must take leadership and its personnel be educated to accept the broader concept of sanitation, which is more than disease control. As a way of life it includes social, mental, and sociologic, as well as physical sanitation. Haven Emerson said "In the century that follows, success will be measured by understanding and willing participation, each for each other, a comradeship for the health of all, a true social sanitation in which the professions of public health and the people served are mutually involved."

The following officers of the Foundation were reëlected:

Chairman: Mark Hollis, Assistant Surgeon General, U. S. Public Health Service
Vice-Chairman: C. W. Klassen, Chief Sanitary Engineer, Illinois Department of Public Health
Secretary: Harry E. Miller, Michigan School of Public Health

INGRAM AS TEACHER AND EDITOR

William T. Ingram, Engineering Field Associate of the American Public Health Association for the past 2½ years, in charge of the Engineering Section Project, resigned on May 1 to become Associate Professor of Public Health Engineering, New York University. He remains with the Association in a consultant capacity.

Mr. Ingram has also recently taken on editorial responsibilities with the new sanitation monthly entitled *Modern Sanitation*. Vol. 1, No. 1, of this appeared in May, 1949, "as a magazine slanted wholly and exclusively to the field of sanitation and industrial housekeeping," and going to the "sanitation specialist whatever his title or position."

Mr. Ingram, with the title of editorial director, is chairman of an editorial board made up of:

J. Lloyd Barron, C.E., Manager, Sanitation Department, National Biscuit Company
Charles A. Clark, General Foods Corporation
W. L. Mallmann, Ph.D., Professor of Bacteriology and Public Health, Michigan State College
Sol Pincus, Consulting Sanitary Engineer
Edward M. Searls, Ph.D., Entomologist, Sealtest, Inc.
Arthur C. Stern, M.E.,M.Sc., Chief Engineer, Division of Industrial Hygiene and Safety Standards, New York State Department of Labor

Modern Sanitation is edited by James V. Cawley, and is published by Powell Magazines, 855 Avenue of the Americas, New York 1. Annual subscription $2, 2 years $3.

LABORATORY REFRESHER COURSES

The Laboratory Division of the Public Health Service's Communicable Disease Center announces the following refresher courses in laboratory diagnosis during 1949:

Laboratory Diagnosis of Parasitic Diseases: September 12–October 21
Laboratory Diagnosis of Bacterial Diseases: Part 2, General Bacteriology October 31–December 2
Laboratory Diagnosis of Rabies: November 14–18.
Advanced Enteric Bacteriology: December 5–16

Information and applications from the Chief, Laboratory Division, Communicable Disease Center, 291 Peachtree Street, N. E., Atlanta, Ga.

IOWA PUBLIC HEALTH ASSOCIATION

The 22nd Annual Meeting of the Iowa Public Health Association was held in Des Moines, June 2–3. Items on the program included discussions of community health councils, various methods of publicity, including radio, health exhibits, visual aids, schools, and newspapers, a study of Iowa's health needs, public health statistics, child guidance, safety, sanitation, health films, merit system affairs, dental services, and nutrition.

Newly elected officers include:

President: I. H. Borts, M.D.
President-Elect: Sophie Fevold, R.N.
Vice-President: Paul Bolton
Secretary-Treasurer—L. E. Chancellor

The Iowa Association appointed a committee to make arrangements and send invitations to public health personnel in the central states to meet in Des Moines in 1950 as a middle states conference on public health. The purpose of such a conference would be to provide a professional meeting covering all public health interests in the area, with a view to the eventual formation of a middle states branch of the American Public Health Association. The successful development of the Western and Southern Branches of the A.P.H.A. was noted and the desirability of affording annually in the middle states area opportunities to meet with special talent of the best grade, making such meetings accessible to most of the public health workers in this area.

DR. WISHIK REPLACES DR. BAUMGARTNER ON A.P.H.A. CHILD HEALTH COMMITTEE

Leona Baumgartner, M.D., who has assumed the position of Associate Chief of the U. S. Children's Bureau, Washington, has resigned as Chairman of the Association's Committee on Child Health. She has been succeeded as Chairman by Samuel H. Wishik, M.D., Director of the Bureau of Child Health, New York City Department of Health.

NURSING IN POLIO EPIDEMICS

The National Foundation of Infantile Paralysis has made grants totaling nearly $1,000,000 to 3 nursing agencies for the purpose of assuring adequate nursing services in possible polio epidemics. The National Organization for Public Health Nursing, with the participation of the League of Nursing Educa-

tion, was granted $64,700 to continue an advisory service to public health agencies and hospitals in nursing care of the infantile paralysis patient and planning for possible epidemics. The grant also provides for helping schools in teaching proper posture in nursing and for consultation services in orthopedic nursing.

The American Nurses' Association's grant of $10,000 is for the purpose of establshing and maintaining an inventory of professional registered nurses, large numbers of whom need to be recruited during polio epidemics. The Committee on Careers in Nursing, sponsored by 6 national nursing organizations, received $18,500 to assist in its recruitment program for student nurses.

NEW CINCHONA REVIEW

The Cinchona Products Institute (10 Rockefeller Plaze, New York), in June began the publication of *Cinchona Review* under the editorship of Albert Hemming, M.B., M.R.C.S. Its purpose is to bring together for practising physicians, progress in malariology which is mainly reported in specialized journals which few practitioners see regularly. It promises to cover the entire scope of cinchona alkaloids and will have abstracts of outstanding papers, news of conferences, academic appointments, and activities of learned societies and individuals.

WEST VIRGINIA PUBLIC HEALTH ASSOCIATION

The West Virginia Public Health Association met at Charleston in June in connection with the 25th Annual State Health Conference with about 450 participating. The association reported a banner year as to membership. It now has over 400 members, an increase of more than a third over the previous year. The officers for 1949–1950 are:

President: O. R. Lyons, sanitarian, Monongalia County Health Department
Vice-Presidents: Olive Ward Snyder, public health nurse, Marion County Health Department; A. Glenn Evans, M.D., Marion County Health Officer
Treasurer: Annette King, State Department of Health

NORTHERN CALIFORNIA PUBLIC HEALTH ASSOCIATION

The following officers were elected at the June 10 Annual Meeting of the Northern California Public Health Association:

President: C. Martin Mills, M.D., Commissioner of Health, Richmond
President-Elect: Levitte Mendel, Health Education Consultant, State Department of Public Health, San Francisco
Vice-President: John R. Philp, M.D., Health Officer, Merced County Health Department, Merced
Secretary: L. Amy Darter, Supervising Bacteriologist, State Department of Public Health, Berkeley
Treasurer: Ramona Hopkins, Director of Public Health Nursing, Alameda County Health Department, San Leandro
Representative on A.P.H.A. Governing Council: Harold F. Gray, Lecturer on Public Health, University of California, Berkeley
Representative on Regional Board, Western Branch, A.P.H.A.: Nina Simmonds, Sc.D., Assistant Clinical Professor of Nutrition, University of California, San Francisco

PROGRESS REPORT ON THE HOSPITAL SURVEY AND CONSTRUCTION PROGRAM

According to the *Washington Report on the Medical Sciences,* the accumulated report to May 31 on progress under the Hill-Burton Hospital Survey and Construction program shows that 387 projects have received final approval and 410 initial approval for a total estimated cost of $483,000,000. Of this sum, the federal contribution will be $149,000,000. Every state and territory now has had at least one project application approved with the exception of Delaware and the District of Columbia. The leading states with reference to dollar value of finally approved projects are Pennsylvania, Tennessee, North Carolina, and Texas.

MICHIGAN DEPARTMENT REORGANIZED

The Michigan State Department of Health, under its new Director, Albert E. Heustis, M.D., has been reorganized into 7 divisions where formerly there were 16 bureaus. A Division of Local Health Services, under J. K. Altland, M.D., has been created to bring together under one administrative head the state services provided to people as individuals, and will include the former dental, public health nursing, and local health bureaus.

Other divisions are Tuberculosis and Venereal Disease Control; Disease Control, Records and Statistics, which combines the former disease control and records and statistics in order to correlate disease control with morbidity and mortality reporting; Engineering; Industrial Health; Laboratories; and Administrative Services.

STANDARD MILK ORDINANCE REVISED

The revised milk ordinance recommended by the U. S. Public Health Service, issued in multilithed form in April, 1949, represents the first comprehensive revision of this model ordinance since 1939. Copies are available from the U. S. Public Health Service. The new form of the ordinance has been approved by the Service Milk and Food Sanitation Advisory Board, and will be incorporated in the 1950 edition of *Public Health Bulletin* 220. The revision is based on changes proposed by state and local health agencies, the dairy industry, equipment manufacturers, and the staff of the U.S.P.H.S. Particular attention was given to the changes suggested by the Committee on Milk Regulations of the International Association of Milk and Food Sanitarians, with a view to making the ordinance acceptable not only to areas already operating under the Service ordinance but also to those operating under other standards. A discussion of the more important amendments made to the ordinance appeared in the *Journal of Milk and Food Technology* for May–June, 1948, and reprints are available from U.S.P.H.S.

ILLUMINATING ENGINEERING SOCIETY ELECTS NEW OFFICERS

The Illuminating Engineering Society announces the election of the following officers:

President: Charles H. Goddard
Vice-President: S. G. Hibben
General Secretary: A. H. Manwaring
Treasurer: E. M. Strong

The elections are effective October 1, 1949.

Professor Strong is also Chairman of the Joint Committee on Research Problems in Illumination composed of members of the Association and the Illuminating Engineering Society.

WEST VIRGINIA STATE BOARD OF HEALTH

West Virginia has a new 9 member State Board of Health created by the 1949 Legislature in a bill sponsored by the state medical society. The 9 members, appointed by the Governor for terms ranging from 1 to 9 years, include 2 physicians, a surgeon, an osteopathic physician, a dentist, pharmacist, a hospital representative, and 2 citizen representatives. The executive officer of the board is the State Health Commissioner, Newman H. Dyer, M.D., whose title has been changed to state director of health.

YALE EXPANDS ALCOHOLISM CLINIC

Simultaneous opening of a state supported outpatient clinic in New Haven and the reorganization of the Yale Plan Clinic have increased Connecticut's facilities for the care and study of alcoholism. The Yale Clinic has been moved to the Yale Laboratory of Applied Physiology. Its services for the treatment of alcohol addicts outside of the state will continue on a limited scale but will be charged for in accordance with the patient's economic status. Its community facility functions have been

taken over by the state operated clinic but it will continue to provide consultant services to industry and to community agencies and will correlate its research with the Laboratory of Applied Physiology.

BCG VACCINATION LAW IN FRANCE

A new law in France will result in the vaccination against tuberculosis of an estimated 10,000,000 Frenchmen. Tuberculin tests and BCG immunization, under the law, are made compulsory for children in maternal homes and orphanages, elementary school children, babies in a family of one or more tuberculous persons, medical and dental students, apprentices in laboratory research and nursing, hospital personnel, government employees, members of the armed forces, and food handlers in public places. The only exemptions in these categories are persons over 30 who may, nevertheless, obtain free inoculations at any of the hundreds of anti-tuberculosis centers that are to be set up as a part of the plan.

10 YEARS OF GRANTS-IN-AID

The Public Health Service has just issued its Bulletin No. 300 entitled *Ten Years of Federal Grants-in-Aid for Public Health, 1936–1946,* prepared by Joseph W. Mountin, Assistant Surgeon General, Emily K. Hankla, and Georgie B. Druzina, Statisticians. This details the background and history of the grants-in-aid program, the development of state and local health activities, and gives expenditure figures. It also has an extensive bibliography. Superintendent of Documents, Washington, D.C., 25 cents.

REGIONAL MEETING, INTERNATIONAL UNION AGAINST THE VENEREAL DISEASES

The International Union Against The Venereal Diseases is holding its General Assembly in Rome, September 12–16. The Union has been given the status of "official relationship" to WHO in accordance with the latter agency's plan of relationship to international voluntary health agencies.

The International Union's Regional Office for the Americas, whose director is Jean B. Pinney, in the belief that "we in the Americas should be mutually informed and . . . make use of every opportunity offered for us to come together for better acquaintance and coöperation," has suggested that members of the Union attending the A.P.H.A. meeting in New York join in a regional conference on Sunday, October 23, to hear reports from Union delegates attending the Rome meetings of the World Health Organization and of the International Union, and to make plans for future coöperation in carrying out the actions agreed upon at these assemblies.

For further information concerning the regional conference, address Jean B. Pinney, Director of the Regional Office for the Americas, International Union Against The Venereal Diseases, 1790 Broadway, New York 19.

TENNESSEE PUBLIC HEALTH ASSOCIATION

The Tennessee Public Health Association held an annual meeting in Nashville, May 2–4. New officers were elected as follows:

President: Frank A. Moore, M.D., Jackson
Vice-President: Helen Jean, R.N., Johnson City
President-Elect: Harcourt A. Morgan, Jr., M.D., Lewisburg
Secretary-Treasurer: Monroe F. Brown, M.D., Nashville

SECOND WORLD HEALTH ASSEMBLY IN ROME

The second World Health Assembly of the World Health Organization was held in Rome, June 13–July 2, 1949. Karl Evang, M.D., Surgeon General, Health Services of Norway, was elected president to succeed Andrija Stampar, M.D., Professor of Hygiene, University

of Zagreb, Yugoslavia, who was president of the First Assembly held in Geneva in 1948, and chairman of the Interim Commission during its existence. Dr. A. Mudaliar of Madras was elected chairman of the Executive Board of WHO. H. Van Zile Hyde, M.D., Public Health Service, was reëlected to a three year term as United States representative on the Executive Board.

In his opening address Dr. Evang suggested that this was not yet the "century of the common man," but rather of the economist, and proposed that the motto of this second World Health Assembly might well be, "Let not the economist make us forget the human being." He further emphasized that WHO is not a political body but one in which "we must all think and feel one for all and all for one . . . It is my hope that we shape the important work of the second Assembly in the spirit of John Donne who said, 'No man is an Iland, intire of it selfe; every man is a peece of the Continent, a part of the maine; if a Clod bee washed away by the Sea, Europe is the lesse, as well as if a Promontorie were, as well as if a Mannor of thy friends or of thine owne were; any mans death diminishes me, because I am involved in Mankinde; and therefore never send to know for whome the bell tolls: It tolls for thee.'"

The second World Health Assembly accepted the idea in international health work of demonstration areas in which all problems pertinent to that area will be tackled with modern methods adapted to the area. In his closing address, President Evang spoke of the new horizons in health opened up by the economic development through technical assistance of under-developed areas, as proposed by President Truman. He praised the recognition by statesmen and economists of the close relation between health and economy. He warned further that justified pride in national health achievements should not obscure the fact that no country has completely solved its health problems, as witness poor farmers and fishermen the world over, the slums of industrial cities, and the millions of lives annually lost through malaria, tuberculosis, cholera, etc.

CONFERENCE ON ANTISEPTICS

The Biology Section of the New York Academy of Sciences announces a conference on "Mechanisms and Evaluation of Antiseptic Activity," to be held in New York City on October 28–29, 1949.

The first session on Friday afternoon will deal with the chemicals from living organisms—the antibiotics. Subjects covered will include their colloidal nature, adsorption on proteins, effect on bacterial metabolism, conditions for optimum effect, and the correlation of improved *in vitro* tests with clinical uses.

Chemicals characterized by high surface-activity, and especially the quaternary ammonium compounds, will be discussed Friday evening. The necessity and procedure for neutralizing any such chemical to permit accurate distinction between bacteriostatic and bactericidal effects, the mechanisms by which surface-active agents are effective and are neutralized, and the evaluation of some compounds will be the themes.

On Saturday morning similar discussions will be concerned with the halogens, mercurials, alcohols and other agents, as well as high temperature, with respect to mechanisms, resistant organisms, toxic effects on tissues and procedures for evaluation. It is proposed that on Saturday afternoon unscheduled discussions, reports, and suggestions may be presented from the audience.

Attendance at the conference is limited to members of the Academy and invited guests. Scientists interested are requested to write to Mrs. Eunice

Thomas Miner, Executive Director, New York Academy of Sciences, Central Park West at 79th Street, New York 24, N. Y. Copies of the printed program, which will serve as invitations and tickets of admission, will be sent out early in October.

PERSONALS

HAZEL E. ALTMANN, R.N.,* succeeded RUTH R. HALL, R.N.,† as Tuberculosis Nursing Consultant of the Indiana State Board of Health in May, 1949.

ARTHUR J. ALTMEYER, U. S. Commissioner for Social Security, received the 1949 Survey award "for imaginative and constructive contribution to social work," presented at the June meeting in Cleveland of the National Conference of Social Work.

Announcing—

Salundek

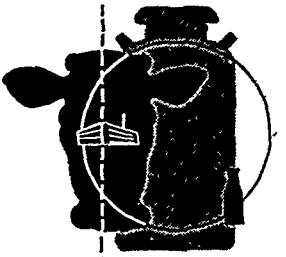
A new antimycotic, proven to be effective in

TINEA CAPITIS

Control of this refractory fungus infection has been a distressing problem. Because of the inconvenience and possible hazards of X-ray treatment (1) research was stimulated for drugs for topical application.

In SALUNDEK Ointment, Wallace & Tiernan offers a practical solution to problems of dosage and penetration (2). Established antimycotics (undecylenic acid-zinc undecylenate) are combined with an effective penetrant in a proper base.

SALUNDEK Ointment is virtually non-irritating. With persistent application, the average case can be cured in a relatively short period.



Supplied in 1 ounce Tubes and 1 pound Jars. Available at all prescription pharmacies.

(1) Editorial, J. A. M. A., 138:214, 1948.
(2) Newcomer, D., Livingood, C.S., and Pillsbury, D. M., in press.

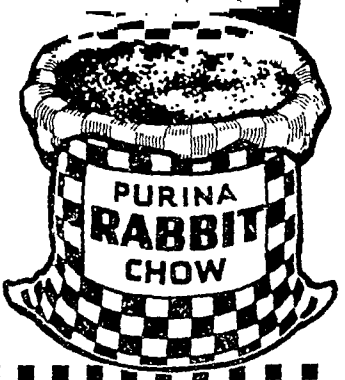
DEPENDABLE

For the regular and therapeutic diets, or when animal protein is diminished or contra-indicated, dried brewers' yeast is suggested, together with other proteins of vegetable origin.

The nutritionally complete proteins of brewers' yeast are more readily digested and possess a high biological value when compared with proteins from other sources.

Too, the whole of vitamin B present in brewers' yeast is an important therapeutic factor. VITA-FOOD has been a dependable source for nearly a quarter of a century.



And AUTOLEX, enzyme autolyzed, supplies the brewers' yeast factors in a palatable and easily available form.

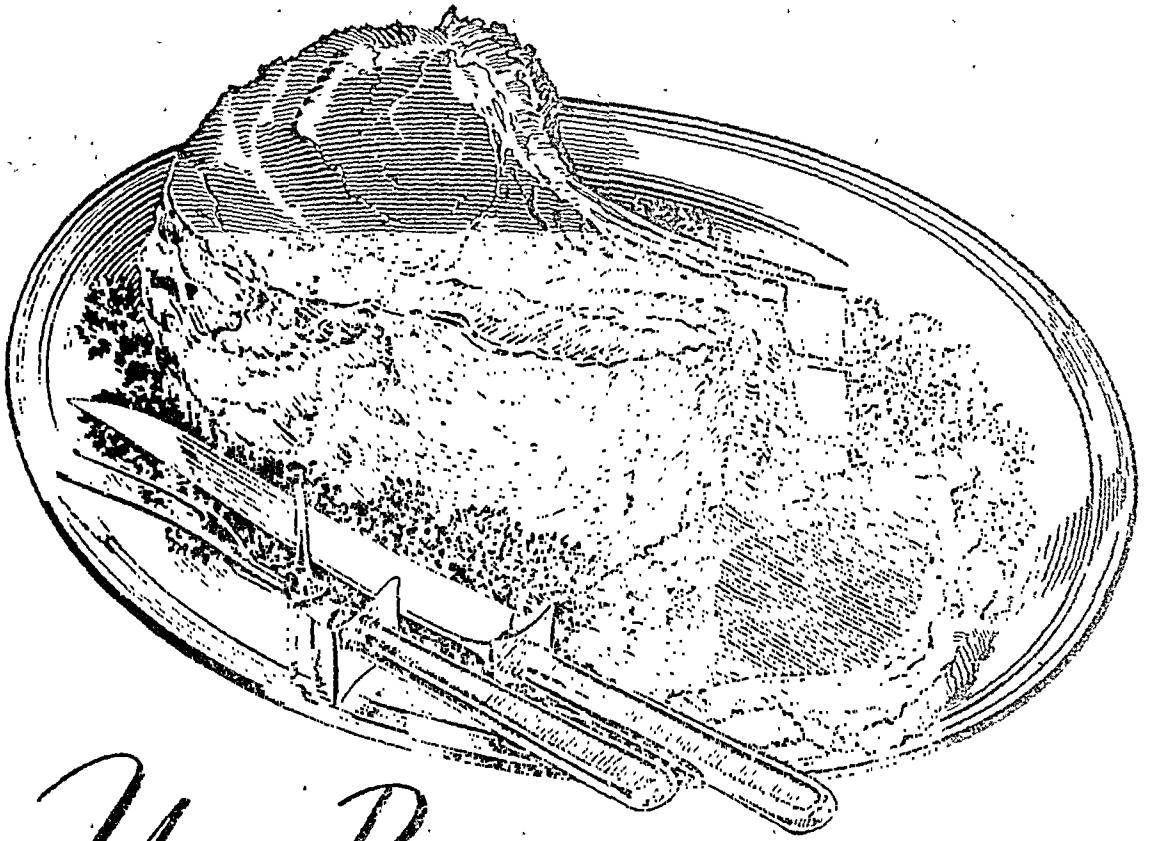
NOW SEALON HOOD PROTECTION

Available to ALL DAIRIES

The Sealright Co., Inc., announces the introduction of a new one-head hooding machine which is especially designed for small dairy use. This smaller model of the famous Sealon Hood applying machine which is being used by so many of the country's larger dairies, now makes it possible for all dairies to protect their milk with Sealright's sterilized tamper-proof closure which completely seals the entire pouring surface.

Another New SEALRIGHT Sanitation Feature

The ordinary water spray in dairies is of low pressure variety and attempts to wash off excess milk on bottle top with excess water. The new Sealright, *high-pressure, low-water* volume Dri-Spray cleans and dries bottle tops without getting into a messy dairy operation.



Sealright

Sealright Co., Inc.
Fulton, N. Y.—Kansas City, Kansas
Sealright Pacific, Ltd.
Los Angeles, Calif.
Canadian Sealright Co., Ltd.
Peterborough, Ont., Can.

For dairies not yet equipped with Sealon machines these Coverite Caps offer the best protection in closures of this type. Their precision fit, double-thick construction, wax impregnated stock all serve to keep out dirt, dust or moisture.

SEALRIGHT SANITARY SERVICE

Your Patients...

And the Meat They Eat

The established relationship between sound dietary planning and a state of maintained good health emphasizes the nutritional importance of meat, man's favorite protein food.

Not only does meat taste good, but of greater significance, it provides a host of nutritional benefits. Developments in the field of nutrition* have proved that complete protein—the kind that meat supplies in abundance—aids in building and maintaining immunity, hastens recovery after acute infectious diseases and following injury and burns, promotes health during pregnancy, aids in the growth and development of husky children, and is needed to maintain everyone in top physical condition.

No matter from what walk of life your patients come, and whether their pocketbooks demand economy or permit satisfaction of that urge for the fanciest cuts, meat gives them full value for their money.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

Reagents
FOR SEROLOGIC DETECTION
of Syphilis

THIS group of Bacto Reagents is prepared expressly for use in the serologic diagnosis of syphilis by means of the more generally employed complement-fixation, precipitation and flocculation tests. All Bacto antigens are tested for sensitivity and specificity in laboratories designated for that purpose by the author serologists of the tests for which they are specified. No antigen is released for distribution until it has been approved.

Bacto-Kolmer Improved Antigen	a new antigen for the Kolmer technique.
Bacto-Kolmer Improved Antigen (Reenforced)	a new antigen for the Kolmer technique.
Bacto-Kahn Standard Antigen	for routine procedure of the Kahn test.
Bacto-Kahn Sensitized Antigen	for the presumptive procedures of the Kahn system.
Bacto-Eagle Wassermann Antigen	for the Eagle modification of the Wassermann test.
Bacto-Eagle Flocculation Antigen	for the Eagle flocculation test.
Bacto-B J L Wassermann Antigen	for the modification of the Wassermann test devised by Boerner.
Bacto-B J L Flocculation Antigen	for the Boerner, Jones and Lukens flocculation test.
Bacto-Hinton Indicator	for the Hinton glycerol cholesterol reaction.
Bacto-Antisheep Hemolysin	a stable antisheep rabbit serum of high titer.
Bacto-Beef Heart (for Antigens)	for preparation of beef heart antigens, except those used in the Kahn tests.
Bacto-Kahn Beef Heart	used expressly for preparation of Kahn antigens.
Bacto-Cholesterol	an excellent sensitizing reagent for antigens.
Bacto-Corn Germ Sterol	for use in reenforcing the antigen used in the Eagle flocculation test.

PERTUSSIS VACCINE

COMBINED SQUIBB

This chart shows the nutritional contribution and comparative economy of dairy products and all other foods in a good average day's meals planned to follow the Basic Seven food pattern.

Milk and Its Products are an Economical Basis for Daily Meals*

In planning meals, each food must be evaluated *for its relative cost and its potential benefit to the body.*

Milk and its products raise the food value of meals in each of the major aspects of nutrition . . . energy, proteins, minerals and vitamins. The chart above shows that milk and its products—cheese, ice cream and butter—in recommended amounts, can supply well over half of the day's total needs for calcium, phosphorus, riboflavin and vitamin A, and important amounts of other essentials, at considerably less than half of the day's total food cost. The chart demonstrates the fact that milk and its products are an economical basis for nutritious daily meals.

Milk's Food Value is High—Milk is an outstanding example of a food which contributes many times over its original cost in terms of bodily benefits. Without milk it is almost impossible to obtain the recommended daily amounts of calcium from other foods. Needed amounts of riboflavin and protein also are difficult to obtain without milk. In addition to its many *known* benefits, milk also is believed to contain additional nutritional factors whose identity and exact function are not yet fully established. Scientists are constantly carrying on research to bring forth the final significance of milk's nutritional role.

Milk Provides Generously for Its Own "Family"—Milk passes along to its products varying combinations of its nutritive elements. Cheese inherits much of the high quality protein, as well as substantial amounts of calcium and phosphorus. Ice cream, too, retains much of the protein content of milk, and helps increase the calcium and vitamin A intake. Ice cream is also a good source of riboflavin and recently has been shown to contain a highly utilizable form of this vitamin. Butter is a nutritious food in its own right. It is a splendid source of vitamin A and provides needed food energy in a delicious, digestible form.

**Milk is an Economical Food.* Dairy Council Digests. 20:2 (Nov.) 1948.

The presence of this seal indicates that all nutrition statements in this advertisement have been found acceptable by the Council on Foods and Nutrition of the American Medical Association.

Delayed release...

Just as a great dam stores and releases water only as fast as the fertile lands below can utilize it, so does Alhydrox* adsorb antigens and release them *slowly* from tissue after injection. This gives the effect of continuous small doses.

Alhydrox is a Cutter exclusive—developed and used by Cutter for its vaccines and toxoids. It supplements the physician's skill by producing these immunizing advantages:

1. *Alhydrox selectivity controls the absorption of antigens, reducing dosage volume while building a high antibody concentration.*

2. *Alhydrox, because of its favorable pH, lessens pain on injection and reduces side reactions to a minimum.*

3. *Alhydrox adsorbed antigens are released slowly from tissue, giving the effect of small repeated doses.*

* *Trade name for Aluminum Hydroxide Adsorbed*

Specify these Cutter **Alhydrox** *Vaccines:*

The one-dose vial is also available, if desired, with an accompanying ampoule of Water for Injection, U. S. P.

PARKE, DAVIS & COMPANY

DETROIT 32, MICHIGAN

MEDICAMENTA VERA

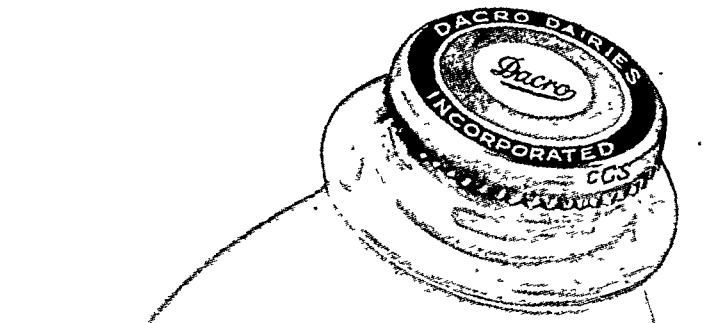
Next time you house-clean, pause a moment by a sunlit window. You will see thousands of dust motes floating in the beam.

Light does not produce this dust. It is everywhere in the air you breathe. Conventional methods of cleaning often fail to eliminate it, by letting dust filter back into the air you breathe.

Wouldn't you like to clean *clean?* Wouldn't you like to know that the dust you remove from floors, carpets and furniture is eliminated from your house forever? You can—with Rexair.

Rexair has no bag. It uses a pan of water to trap dust and dirt. Wet dust cannot fly, and dust cannot escape from Rexair's water bath. You pour the water down the drain, and pour the dirt away with it.

REXAIR DIVISION, MARTIN-PARRY CORP.
BOX 964, TOLEDO, OHIO, DEPT. P-109



FREE BOOK—Send for this colorful, illustrated 12-page book. Shows how Rexair does all your cleaning jobs, and even "washes" the air you breathe. Ask for all the copies you can use. No obligation.

SECURITY
. . . at a saving

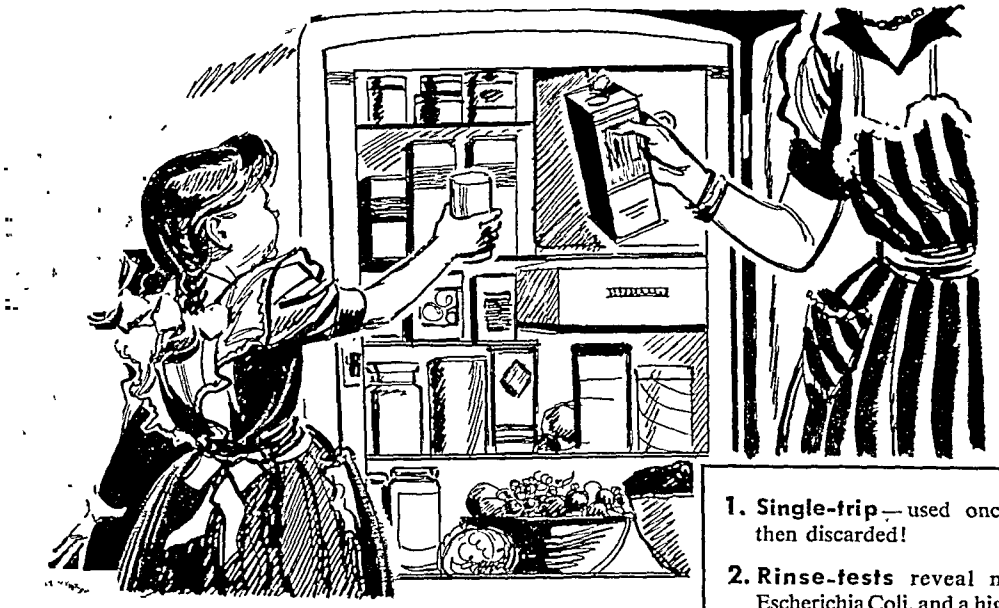
Forms an *air-tight* seal

Covers the pouring lip of the bottle

Eliminates seepage

Does away with "cap seal"

Makes a perfect re-seal



When bottled milk is capped with Dacro P-38 it is *securely sealed* against a wide variety of hazards that can easily affect milk purity. Both the Steel Dacro P-38 and Aluminum Dacro P-38 give this dependable protection . . . and at a saving. Dacro P-38 saves on cap cost because of its smaller size. But even more important are the economies it offers the dairy plant operator through the proven efficiencies of the *Dacro Capping System.*

CROWN CORK & SEAL COMPANY

Dacro Division • Baltimore 3, Md.

In Portugal the milkman is a milkwoman! She goes from door to door with her picturesque copper containers, burnished by years of use, and possibly contaminated by many germs of milk-borne diseases.

In America it's safe, sanitary Canco flat-top paper milk containers . . . the one-way system whose nationwide acceptance has been aided by Public Health Officials.

CANCO

American Can Company New York, Chicago, San Francisco

1. **Single-trip** — used once, then discarded!
2. **Rinse-tests** reveal no Escherichia Coli, and a high percentage of complete sterility in containers delivered to the dairy.
3. **Opened, filled,** and closed in minimum time by machines!

3½ times the service with

T.M. REG. PYREX U.S. PAT. OFF.

CULTURE TUBES

Clinical research requires culture tubes in large numbers. Consequently, their cost, service life considered, is a matter of importance. From this standpoint alone, you will find that PYREX brand culture tubes are the best investment. Careful records maintained over a period of years by large culture tube users show that PYREX tubes last 3½ times longer than other brands.

This is not so surprising when you consider that no other glass stands up like PYREX brand No. 7740. Compare it with any other laboratory glassware under identical conditions. The superiority of PYREX ware to chemical, thermal and physical resistance will be readily demonstrated.

All of this is reflected in more accurate analysis. Your laboratory dealer carries complete stocks of PYREX brand culture tubes for your ordering convenience.

STANDARD INSTRUMENT for COLORIMETRIC ANALYSIS

Fisher

ELECTROPHOTOMETER

—eliminates the human factor—

The Fisher Electrophotometer permits colorimetric analyses to be made accurately, quickly and simply wherever the color of the solution varies in a definite manner with the concentration of a constituent. Because of its unique, valuable features, the Electrophotometer is now widely employed for conducting many essential routine analyses and for research.

The Electrophotometer operates from any 110 volt, 50-60 cycle line. With it, the user can detect very slight color intensity differences because the photoelectric system it employs is considerably more sensitive and reliable than the human eye. Once a calibration is made, subsequent analyses can be conducted as rapidly as the simple operations can be performed.

Fisher Electrophotometer, complete with galvanometer, three filters, three 23-ml. absorption cells, manual of typical procedures for use with 110 volts, 50-60 cycle A.C. only $210.00

LENGTH OF LIFE

A Study of the Life Table

By Louis I. Dublin, Alfred J. Lotka, and Mortimer Spiegelman
Metropolitan Life Insurance Company

NEWLY REVISED EDITION—JUST OUT. This book traces and interprets the progress in health and longevity from earliest times to the present, with emphasis on the social and scientific influences that brought it about. The authors have used the facilities of one of the outstanding statistical offices in the insurance business to analyze the basic contributions in vital statistics, public health, and medical science as they bear on longevity.

Here is a wide range of material on the relation between longevity and such factors as family history, biological influences, body build, physical condition, medical history, and occupation. For vital statisticians, students of the social sciences, and health workers generally, there is a clearly worked out example of a short method of computing a life table. And the volume includes the most extensive collection of life tables available in a single source.

This revised edition is virtually a new book, and brings up-to-date a work which, when it first appeared, was warmly received and widely quoted by professional workers in the social and medical sciences. *379 pages. 32 charts. 94 tables.*

$7.00

THE MONEY VALUE OF A MAN

By Louis I. Dublin and Alfred J. Lotka
in collaboration with Mortimer Spiegelman

DEVELOPED out of the authors' work in life insurance in determining the money value of persons at various ages according to their earnings. Of value to economists, health officers, and social workers interested in the costliness of disease and premature death; to every adult person concerned with the responsibility of family protection; to those charged with making fair awards for personal injury and incapacitation. Extensive recomputations have been made of the tables to conform to altered conditions resulting largely from lowered interest rates and increased expectation of life of the American population. *"Recommended to every public health administrator as an essential book of reference."*—American Journal of Public Health. *65 charts and tables.* $6.00

THE DIABETIC'S HANDBOOK

ANTHONY SINDONI, Jr., M.D., *Philadelphia General Hospital.* 6 Contributing Specialists. Manual explains in simple, nontechnical terms the things diabetics must know and do to cooperate fully in their treatment. Special set of almost 200 Questions-and-Answers covers every pertinent question patients ask about their part in the care of the disease. Suggestions are offered for making dieting easier and the diabetic's regimen more manageable. Many tables, menus, recipes, charts, illustrations. $3.00

HEALTH EDUCATION IN SCHOOLS

JESSE FEIRING WILLIAMS, *Professor Emeritus, Columbia University,* and RUTH ABERNATHY, *University of Texas.* Authoritative orientation in this fast-growing and rather confused field. Describes the duties of personnel now active in health education, explains the need for new types of personnel to conduct health education satisfactorily, and examines practically the matters of healthful school living, service, and instruction. Real help in the solution of a national health problem. *328 pp.* $3.50

SANITIZING AGENT

TO DO A BETTER SANITIZING JOB

EVERY TIME

The ORIGINAL Quaternary Ammonium Germicide

243189R
This Control No. Guarantees
POTENCY
UNIFORMITY
QUALITY

Laboratory tested and Controlled

The sanitizing properties of quaternary ammonium compounds are so well known to public health officials that little could be said about them that you do not know. Almost everybody in public health work has added the "quats" to the armamentarium he uses in his war on disease.

The question then, is which "quat"? Are they all alike? Which one can I depend on to do the job expected of it *every* time?

In Roccal, the original quaternary ammonium germicide, you are offered a product that is always uniform in quality because it is made under the most rigid controls. Every batch must pass the comprehensive laboratory tests of one of the world's leading pharmaceutical manufacturers. You can depend on Roccal to do a better sanitizing job *every* time!

When you specify a "quat"

NEW! DIFFERENT! AND SO CONVENIENT!

THE NEW

Measure-Pak

EASY MEASURING GUIDE

1 print = ½ CUP

½ print = ¼ CUP

¼ print = 2 TABLE-SPOONS

Every pound is cut in quarters to make measuring easy . . . cooking breezy!

Here's the most welcome margarine news of the year! Nucoa is in the wonderfully convenient new Measure-Pak—designed to do away with slow, bothersome spoon-and-cup measuring for good. Just use Nucoa quarters as a scale—and get the exact amount your recipe calls for . . . easily, speedily, accurately. Handy new Measure-Pak is another Nucoa "first"—latest of the many reasons why home economists and housewives alike have trusted Nucoa for over 30 years.

EASIER TO "BOWL-MIX" TOO! You don't have to soften a *solid* pound block before you start coloring . . . it reaches the right mixing temperature more quickly and evenly . . . and it's easier to distribute the pure color wafer evenly, right at the start. Enriched with 15,000 units of Vitamin A per pound, delicious, churn-fresh, Nucoa margarine is as fine a spread for bread as you can buy.

THE FIRST SUCH RECORD EVER PUBLISHED, OF

Group Medicine & Health Insurance

in Action!

By R. E. ROTHENBERG, M.D., KARL PICKARD, M.D., and JOEL ROTHENBERG. Foreword by GEORGE BAEHR, M.D. (Dr. Rothenberg is head of the Central Medical Group of Brooklyn, one of the country's largest, and with Dr. Pickard and Joel Rothenberg helped to found it.)

THIS BOOK IS the full record of the Central Medical Group's two years of effective service in giving full medical attention to its 14,000 subscriber-patients. Comprehensive, completely documented and reliable, it presents the precise detailed experience of a large-scale Medical Group operating under a *Voluntary* Health Insurance Plan. It tells exactly what care and attention subscribers receive for their prepaid insurance and also what services participating physicians perform, the amount of time they devote to the group, how their work is divided, how their compensation is computed.

SOME IMPORTANT QUESTIONS THIS BOOK ANSWERS

- Does a subscriber get unlimited medical care, including operations, without charge?
- Are there specialists like obstetricians, neurologists, pediatricians, included in the group?
- Does the subscriber get the full benefit of their services without any extra charge whatsoever?
- Does group medicine tend to improve the health and lengthen the life span of its subscribers?
- Can anyone as an individual join a medical group?
- How many physicians are required to form a completely integrated medical group?
- Are subscribers accepted individually or in groups like labor unions, municipal employees, and entire company's personnel, etc.?
- What are the legal and financial aspects of organization?
- How does one go about forming a medical group?

IN GROUP MEDICINE AND HEALTH INSURANCE IN ACTION, you will find the information and guidance that will enable physicians, legislators, social workers, and laymen to make intelligent decisions about health insurance. We advise that you order this important book now before you forget to do so.

Crown Publishers, 419 4th Ave., N. Y. 16

When *Energy Expenditure* is High

When vigorous sports and outdoor activities increase caloric energy requirements, candy proves nutritionally advantageous as well as satisfying. It yields its contained carbohydrate promptly, permits of rapid replenishment of depleted or lowered glycogen stores, and aids the organism in recovering from fatigue. Furthermore, virtually everyone likes candy, making it particularly enjoyable when energy expenditure is high during fall and winter.

Many candies are composed of nutritionally desirable foods—butter and other edible oils, milk, nuts, fruits. To the extent these foods are contained, candies contribute their mite of protein, fat, B complex and other vitamins and minerals. Candies not only are valuable as a source of readily available caloric food energy, but also serve to add a satisfying final touch to luncheon and dinner, enhancing the satiety value of these meals.

AN *Antibiotic* PLUS A CARBONATED BEVERAGE

Sketch of a taste pit of the human tongue. The substance being tasted contacts the ciliated sensory buds and a reaction is produced. The two clusters at the base of the pit are mucous glands.

"The patients preferred to take the medicine, when it had to be given in large doses, with a carbonated beverage, because then the medicine did not tend to cause nausea."

In a series of clinical experiments by Ivy and Vaichulas,[1] typhoid carriers were treated with antagonistic bacilli. This preparation, administered orally, created an "antibiotic" in the patients' systems which destroyed the typhoid bacillus.

Administered alone, the preparation caused nausea in most cases, but taken with a carbonated beverage, it was well tolerated.

This is but one of many cases in which bottled carbonated beverages have assisted the physician in overcoming nausea following drug administration. In other cases,[2] they have reduced the time of initial drug action considerably.

In addition to their wholesome refreshment values, bottled carbonated beverages have long been recognized by medical science as valuable in the diets of patients in whom nausea of pregnancy, dehydration and febrile states are factors.

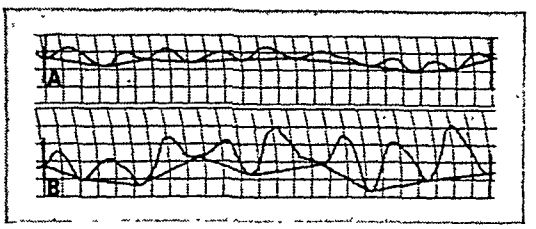
Adequate Breakfast

AND FATIGUE DURING THE PRE-NOON HOUR

That the daily eating of adequate breakfasts lessens neuromuscular tremor during the pre-noon hour was recently shown in physiologic studies* conducted at the Departments of Physiology and Nutrition of a prominent medical college. As a direct consequence of the better nutritional state induced by improved breakfast habits, involuntary neuromuscular tremor is less during the last morning hour when 800 or 400 calorie breakfasts are the daily routine than when breakfasts are regularly omitted or coffee only constitutes breakfast.

Six young women graduate students were the experimental subjects in this carefully controlled scientific investigation. For permitting adequate physiologic adjustments to the four breakfast practices (800 calories, 400 calories, coffee only, and no breakfast), each practice was followed for a three-week period. The data obtained in the 800 calorie breakfast period were used as the standard base of reference.



Using specifically designed apparatus, the investigators determined the pattern of amplitude and rate of involuntary muscle tremor of the unsupported outstretched arm both before and after strenuous exercise. Measurements were made during pre-noon hours of the experimental periods.

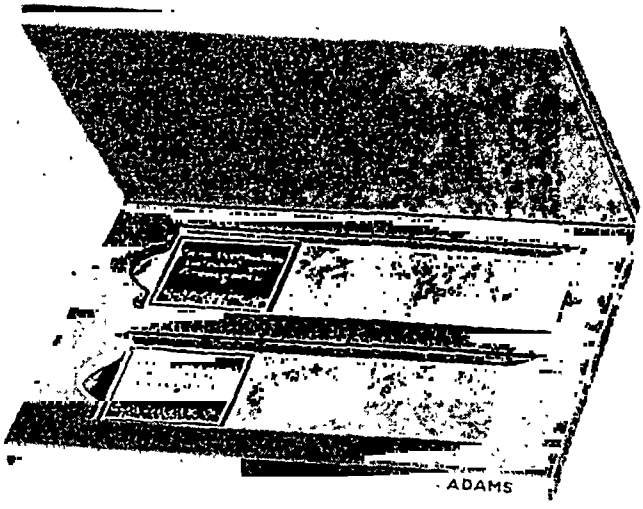
Conclusions derived from this practically significant study follow:

1. When no breakfast was the morning practice, the magnitude of muscle tremor substantially *increased.*
2. Habituation to coffee only for breakfast induced a similar *increase* in magnitude of muscle tremor.
3. Habituation to the 400 calorie breakfast after the coffee-only period markedly *decreased* the magnitude of muscle tremor; the tremor magnitude status tended to return to the status of the 800 calorie breakfast period.

The conditions of the study did not permit a direct comparison of the effects of the 800 and 400 calorie breakfasts on muscle tremor.

Health and nutrition authorities have long proclaimed the importance of daily adequate breakfasts in the promotion of good nutritional health. The results of this scientific study give direct experimental support to the soundness of such dictum.

Neuromuscular Tremor. Record of a normal tremor (A), and (B) exaggerated tremor. Subjects who are accustomed to eating breakfast have an exaggerated tremor when they suddenly begin to omit breakfast.



The presence of this seal indicates that all nutritional statements herein have been found acceptable by the Council on Foods and Nutrition of the American Medical Association.

*Reprint of the research study and findings will be sent on request.

A RESEARCH AND EDUCATIONAL ENDEAVOR DEVOTED TO THE BETTERMENT OF NATIONAL NUTRITION

for safety and economy
ADAMS SLIDE MAILERS

Designed for use by laboratories handling large quantities of slides, where it is important to insure safe handling of slides with a minimum number of operations.

Adams Slide Mailers are made of extra-heavy cardboard, approximately 3/8" thick, with a thumb groove for easy removal of the slides. They accommodate 3 x 1" microscope slides, with or without cover glasses. They can be used over and over again.

To use the Mailers, just slip slides into the depressions in the bottom half, insert into an envelope and send by regular mail. No extra packing or postage is required.

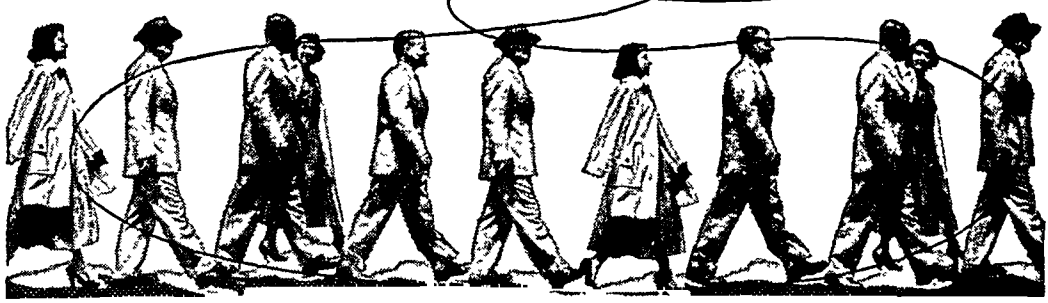
Smith-Gray, Jen-Cel-Lite and The 1949 A.P.H.A. Convention

Smith-Gray is proud to invite Public Health Officials, Public Health Nurses, and all those interested in the Public Health Nursing field who may be in attendance at the 77th Annual Meeting of the American Public Health Association, to visit Display Booth 140 on the Second Mezzanine of the Hotel Statler.

We will introduce to you, for your use and comfort, the most outstanding development in the uniform industry—a remarkable lining called Jen-Cel-Lite. Although light as a feather, Jen-Cel-Lite insulates the coat so completely that a lighter weight material may be used for the coat and still provide perfect 'Warmth Without Weight'.

Smith-Gray has the exclusive rights to Jen-Cel-Lite for the Uniform Industry. ONLY Smith-Gray can make you a coat with a Jen-Cel-Lite lining. This lining has a center insulation and is faced on both sides with windproof taffeta. This scientific discovery has outmoded all coat linings used heretofore. The Jen-Cel-Lite lining for your Smith-Gray coat may be made permanent or zip-in.



Jen-Cel-Lite provides 'Air-Cell Insulation', which spells 'Comfort in Any Climate'. Smith-Gray coats with Jen-Cel-Lite linings will enable Public Health Nurses to enjoy perfect 'Warmth Without Weight' next winter for the *first time!*

Please write us for an order-measure form if you desire to place an order before the Annual Convention. All Smith-Gray garments are skillfully custom-tailored to individual measurements. Four weeks delivery.

Presenting the

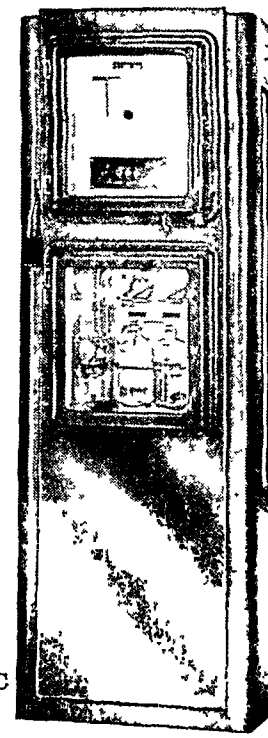
W&T RESIDUAL CHLORINE RECORDER

Culminating 35 years' leadership in chlorination, W&T now offers the Amperometric Residual Chlorine Recorder to water works operators desiring the finest in chlorination control. For the first time, it is possible to actually SEE what you're doing.

WHAT THE RECORDER DOES: It provides a continuous, permanent record of actual chlorine residuals—either free available or total.

WHAT IT IS: The Recorder consists of a cell and a recording mechanism attractively housed in a handsome, gray enameled pedestal to complement any W&T Chlorinator installation. Optional accessories include a *Remote* Residual Indicator and a *Remote* Alarm System.

HOW THE RECORDER WORKS: In a continuous sample of the water under test, a function of the residual is measured and subsequently recorded on a 24 hour circular chart in terms of ppm of residual chlorine.



ADVANTAGES OF RESIDUAL RECORDING: Residual recording includes these big advantages—(1) Better chlorination control (2) A permanent record of performance (3) A check on operating irregularities (4) Determination of chlorine demand (5) To ascertain residuals in the distribution system (6) As a check on chlorine usage to avoid wastage, and (7) Because the record is continuous, operating data is available which could not be obtained by periodic testing.

WHAT USERS SAY: Many installations of this Recorder are in successful operation. Here's what some users say—

"—The recorder enables us to save many dollars on chlorine—"

"—This instrument functions with extreme accuracy and fidelity. It provides something that experienced water plant operators have long desired—"

"—I congratulate Wallace & Tiernan on the *development of this useful equipment* which is probably the most important advance in the science of chlorination in the last twenty years—"

American Journal of Public Health
and THE NATION'S HEALTH

Volume 39 October, 1949 Number 10

Health Goals for 1950

IT occurred to the Editor that, in this Mid-Century, it might be of interest to know what the leaders of the public health movement on this continent were *thinking about, dreaming about, desiring* for the promotion of the health of their peoples. Last May, therefore, a letter was sent out to all the state and provincial health officers of the United States and Canada, asking them to indicate the three major improvements they would like to achieve in their areas, listed in order of priority.

We have received returns from all but six state health officers and from three provincial health officers; and the results are tabulated below. We believe they will be of very real interest to our readers.

The numbers in the table indicate first, second, and third choices, respectively. Texas indicated only one goal. Two states listed more than three goals. Massachusetts placed Public Relations fourth, and Wisconsin added Mental Hygiene as a fourth objective and fluorination of water supplies as a fifth. These are not included in the Table.

The objective which stands far out in front is, as one would expect, the development of local health service on the "local unit" plan. Of the 44 states and provinces reporting, 33 mentioned this as one of their three major objectives; and 20 gave it first place.

The actual status of the local unit program varies widely in different states. Wyoming still needs "an enactment of enabling legislation for local public *health departments on a city, county,* and multi-county basis." South Dakota reports only two units in the state. New England states are, of course, very backward in this respect; but Dr. V. A. Getting in Massachusetts hopes for the passage of pending legislation which would make the formation of local health units compulsory at the end of a ten year period of voluntary action stimulated by state and federal subsidies. Indiana reports only seven units, inadequately staffed.

Other states are much farther along the road. Idaho reports nearly half its population covered but hopes to move rapidly under recent legislation. Colorado has about two-thirds of its population under full-time units. Dr. T. F. Sellers reports that "Georgia has 159 counties, less than fifty of which have organized health departments served by medical health officers. The blueprint toward which we have been working calls for fifty-seven health districts of two or more counties each. The critical shortage of medical, nursing, and sanitation personnel and more recently the lack of funds, are greatly handicapping progress toward this objective. The enactment of the Local Units act of

i. Expansion of public health nursing facilities

1949, or some such equivalent provision, will probably solve the financial handicap but it will still be long before the personnel requirements can be realized."

Still further advanced are such states as Virginia, with 85 per cent of its population covered, and Michigan with 94 per cent. Dr. L. J. Roper of Virginia reports that "at the present time, the major cities and 70 of the 100 counties within the state, are receiving full-time organized health service. Plans have already been completed to establish health services in 8 additional counties effective July 1, 1949. Of the remaining 22 counties, 7 have made the necessary local appropriations for health services which will be established as soon as personnel can be secured."

Such states as Alabama and North Carolina have complete coverage on paper, but list improvement of local service as a major desideratum. Dr. D. G. Gill states that basic health units in Alabama offer "merely a foundation on which adequate personnel, with adequate financing, could build." Dr. J. W. R. Norton in North Carolina states that recruitment of personnel and improvement of quality of service are vital.

A particularly striking contribution to the improvement of local health service comes from Washington. Dr. J. A. Kahl says "First, the activities of the local health departments are being reported to us on mark-sensing cards. In addition, we are breaking down our morbidity and mortality statistics along census tracts as well as our population, and with the use of the mark-sensing cards we will be able to tie activities to census tracts. We are then using field reports made by the various field consultants during the past year, knowledge of all the consultants concerning the particular area and basic economic and social data, as well as business, agriculture and industry in the area. We have now developed a pattern of pulling all of this information together and doing quite a thorough analysis in the State Health Department and completing our analysis with recommendations. The Director of Local Health Services then takes this analysis to the local health department, discusses it with the health officer and staff and requests that they have a planned study of this analysis in staff meetings for a period of four to nine months. At the end of that time, we will have a two or three day seminar in the State Health Department with the total local staff coming to the State Department and all of the consultants possible being in attendance. Here, we will discuss the analysis with the local people and eventually decide upon the type of problems that need attention and developments that need to occur in the area for a three or four year period. Then it will be the responsibility of the Director of Local Health Services to utilize the various consultants in the State Health Department to see that they get this assistance in developing the plan mutually agreed upon."

The second concern of our state health authorities is naturally with the recruitment and training of personnel. Seventeen of them specify this item and 9 of them give it first priority. Dr. J. S. Wheeler of New Hampshire says, "It is practically impossible for the Department of Health to fill staff vacancies, especially those of physicians, dentists, and engineering personnel with competent persons because of the very low salaries to which we are restricted. Because of this situation we have been unable to fill several of our vacancies with competent personnel and are in danger of losing several of our key-personnel. Since no department is better than the personnel which constitutes it, the situation is critical."

The same situation obtains in Canada. Dr. M. R. Bow of Alberta says, "It is becoming increasingly difficult to attract and retain the services of well qualified

medical officers of health, sanitary engineers, public health nurses, laboratory assistants and other technical personnel, on present salary schedules." Dr. J. T. Phair of Ontario says, "we are hampered by one common obstacle, namely the availability of trained staff. For instance, in health education, in the expansion of nutrition work and in a greater development of the mental health service, we find ourselves at a bit of an impasse because of the lack of trained workers."

Not only funds, but also intelligent programs of recruitment and training are essential to meet the need for personnel. Dr. J. W. R. Norton says, "We consider it essential, if we are to have an improved program for local health work, that we recruit to the ranks of public health workers young people with considerable academic training to qualify them to do intelligent and efficient public health work. As a fundamental part of this program we feel that we can exert a wholesome effort in advising local boards of health to pay adequate salaries and to provide a retirement system for each public health worker in North Carolina."

Important developments along this line are reported from Washington. Dr. J. A. Kahl says, "With the assistance of the Kellogg Foundation, we have developed a training program in our local health departments for both students from the University of Washington, including medical and dental undergraduates, as well as public health personnel coming to the state and basic training for people without postgraduate training in public health where it is necessary for us to use them. With the assistance of the Children's Bureau, the State Department and the University of Washington have had in progress the development of a Child Health Center to study growth and development and to teach and offer participation in the various schools at the University. In addition, we hope to transfer our Child Guidance Clinic so that it will be a part of this Center at the University for studying growth and development of the total child. We hope to get health officers and practising physicians as well as nurses and other public health people to attend this Center for intensive instruction.

"The problem of recruiting and retaining, as well as training professional personnel, is a tremendous one at the present time. We are planning to increase our salaries effective July 1 and a copy of our schedule is attached. We hope that with these efforts of training and in-service, intensive courses for our people, as well as more adequate salaries, we may be able to attract many young, ambitious people into the field. Our relationship with the medical school and the fact that physicians, dentists, and nurses are going to get field experience in public health, should be beneficial to the whole program."

Following the two fundamental essentials of local health units and adequate personnel, the table presented reveals a series of goals involving programs for the control of certain specific groups of diseases. The most generally popular of these is the group of programs related to chronic diseases and the disorders associated with an aging population. Eleven health officers mention this type of programs specifically, and California and New York give it top priority. Sometimes chronic diseases are particularly stressed as in California. Dr. W. L. Halverson says, "A major drive is being carried on at the present time to develop a service in relation to diseases of later life. A bill is now pending before the Legislature which would set up a Bureau of Chronic Diseases in the State Department of Public Health and which would place specific responsibilities with this bureau particularly in relation to the development of statistical and preventive serv-

ices. An appropriation of $100,000 is included. It is quite probable that we will have an opportunity of again presenting this to the Legislature because bills for appropriations are not receiving very favorable attention."

In other states, cancer and heart disease are emphasized (with specific programs for heart disease and cancer in Mississippi). Dr. H. E. Hilleboe of New York outlines a three-point program, as follows:

a. Widespread early case finding services, especially examinations for early and precancerous lesions, diabetes, cardiovascular-renal disease, and other chronic diseases of adult life
b. Facilities for chronic disease care with major emphasis on home care, hospital care, and intermediate institutional care for the chronically ill, associated with medical centers and medical schools
c. Provision for the rehabilitation of the chronically ill to include organization of facilities through rehabilitation centers in hospitals throughout the state

In Florida, Dr. W. T. Sowder has plans for a state-wide diabetes program to include, in addition to free distribution of insulin for indigents (already in effect) case finding, case holding, and education of diabetics.

In fourth place comes the development of a more complete mental hygiene program, called for in 8 states, with first priority in Mississippi. In Utah, Dr. W. W. Bigelow reports that the State Welfare Department has been the mental hygiene authority of the state in the past but that this duty has been recently transferred to the State Department of Health. Dr. R. H. Riley in Maryland notes the urgent need for outpatient service for mental disease and for further research on the problems involved.

Dr. T. F. Sellers of Georgia desires to develop mental hygiene service with special reference

a. to the further establishment of child guidance centers
b. to education in the fundamentals of mental hygiene, particularly through university, nursing, and social service workers
c. to improvement of our obsolete commitment laws for admittance to mental institutions

Dr. F. J. Underwood presents the following reasons for a program of this type:

"a. Specialists in psychiatry, psychology, social work, and public health nursing are badly needed for study and service to serious cases of mental disease.
"b. Time and training are needed for the present staff of physicians, nurses, educators, and so on to care for the mental health needs of our present clinic clients.

"This added skill by our present staff would improve our service in our present antepartum clinics, chest clinics, home visits, sanitary inspection, venereal disease follow-up and every contact that we make with the public."

Dr. W. L. Halverson of California writes, "Our second project is to develop a Preventive Mental Hygiene Service in the State Department of Public Health. It is planned that this service will be so designed that it will help local health officers to orient themselves and their staffs on the newer developments in the field of preventive mental hygiene. A start has been made under a grant from the Commonwealth Fund but the drive this year is to secure approval from the state for assuming the service and secure the necessary funds to carry it out."

Geriatrics and mental hygiene represent the newer vistas of public health; but there is still much progress to be made in some of our older activities. It is of special interest to note that tuberculosis—like mental hygiene—is listed as a major objective for new attainment in 8 states (with top priority in Maryland and Tennessee). Dr. J. P. Ward describes tuberculosis as "still our major problem in Arizona." Dr. C. F. Blankenship in Nevada says, "we have a very poor program and a rather high death rate." Dr. L. J. Roper notes

that his Department in Virginia "has already embarked on an extensive construction program to provide additional sanatorium beds for tuberculosis. This activity is receiving major emphasis by the department at this time and it is hoped that, in addition to our routine work, plans may be completed and funds made available to establish two major facilities which will be limited to the surgical treatment of tuberculosis." Dr. R. H. Riley stresses the need for a greatly intensified tuberculosis program; and says, "This will require a more complete and more efficient case finding service, an increase in the use of chest surgery, and a more effective service of rehabilitation. It is not easy to account for the high prevalence of tuberculosis in Maryland but, whatever the causes of this high prevalence may be, there is obvious need for an improvement in our existing service."

The sixth goal listed in our table involves reorganization of the state health department set-up for greater efficiency. This is listed in 8 areas and is given top priority in Newfoundland, South Dakota and West Virginia. In South Dakota the department will be reorganized under a law coming into effect July 1, 1949; and in West Virginia, the Public Health Council will be replaced by a Board of Health and a separate Medical Licensing Board.

Dr. J. A. Kahl emphasizes a development of more effective joint planning in Washington. He says, "I hope to reactivate the State Health Council and to assist in the employment of a full-time executive secretary. My hope is that the council will study the health problems in the State of Washington and collectively determine how well we are meeting them and the ones that we could meet more successfully than at present. Working together, we then hope to plan a program for submission to the legislature, in order to obtain funds to carry out the programs that we can mutually agree upon." He adds "In addition, the staff and I have under consideration the development of advisory committees and consultants to our various programs where practical. We have been inadequate in this phase in the past. Some programs will have professional advisory committees, others will have mixed advisory committees and some will have consultants, such as the laboratory. It is hoped by getting as many people in the community and the state to participate, both professional and non-professional, in the State Health Department programs, we will not only have a sounder program but will have more state-wide support."

Dr. J. W. R. Norton of North Carolina emphasizes the relation of sound central organization to local health services. He says, "We are committed to the policy of holding to the minimum the number of persons employed directly by the State Board of Health as members of the staff of our central organization and, thereby, sending as large a portion as possible of the funds available to the State Board of Health into the county and district health departments. We realize, of course, that in order to follow this policy and yet be in a position to give competent advice, it is desirable for us to consider the advisability of reorganizing our plan for central administration and reduce the number of divisions and bureaus to a number considerably smaller than we have now."

Dr. J. D. Porterfield stresses a similar point. In Ohio he says "the State Health Department functions principally by way of consultation to local health departments and direct services through or for such local health departments. A major consideration, therefore, is improvement of the caliber of consultation provided by the state to local units and more particularly to improvement of the methods of field activities so that they may be integrated into a local unit's program without disruption."

The seventh item in our table is Maternal and Child Health, cited by six states and given top priority in Florida. The objectives of such a program are well stated by Dr. W. T. Sowder as "our expanded and approved Child Health Program which will include a specific program for medical, nursing, and hospital care of prematures"; and this particular part of the program is mentioned by several other contributors (as in Iowa).

The eighth and ninth columns in our table represent closely allied but, we believe, distinct activities. In column 8, we have placed states in which major emphasis was laid on securing popular support for health programs. Six areas appear in this group, with Arizona, North Dakota, and Ohio giving the problem top priority. Dr. J. P. Ward says that better public relations are "very sadly needed in Arizona." Dr. R. L. Cleere of Colorado urges the development of local health councils to promote

"a. Public understanding and support for established health departments.
b. Extension of full-time local health departments."

Dr. T. T. Ross says that "Plans are being formulated to establish and develop a very strong Arkansas State Health Council which will be made up of representatives from various agencies and organizations throughout the state. This overall State Health Council will then further develop and work with local health councils."

In Indiana, Dr. L. E. Burney states, "Greater effort will be directed toward securing the interest, understanding, and support of the various professional groups concerned, striving to develop within them an awareness of their particular responsibility and contribution to the improvement of public health. The value of this approach has been demonstrated in our hospital inspection and licensing program. The medical profession, nursing groups, hospital boards, and administrators meet jointly to consider hospital problems and programs. At the same time an opportunity is provided for discussing the hospital's role as the health center of the area and the physician's role in preventive medicine. The recognition by groups of their obligations and the importance of working together is particularly significant as more emphasis is placed on the problem of chronic diseases. This implies that health departments will have to give greater attention to more comprehensive programs of education than they have in the past."

Dr. J. D. Porterfield writes, "The primary need for public health in Ohio is intensification of a successful public relations program. This should be considered not in the restricted sense of advertising or campaigning, but from the point of view of making a greater number of the state's citizens aware of the public health services available and potentially available in their state, the content and nature of public health activities, and, only finally, the presence of a State Health Department in their government. While health education stimulates people to action, some more far-reaching process is very necessary to bring them to consider this subject and to make them come to health education meetings and read health education material. Problems of money, personnel, prestige, and activation of program depend for solution on this initial step of public relations."

Our column 9 includes statements which tended to stress the primary functions of health education, as designed to convey information and motivate health habits. This field is included by 6 states, with top priority in Maine.

Column 10 includes goals related directly to the school health program and includes 6 states, with top priority in South Carolina. Some health officers stress the educational problems involved.

Dr. R. L. Cleere of Colorado, for example, urges the need for

"a. Developing health curricula in educational institutions to prepare teachers to do better health instruction.
"b. Promoting complete school health programs of a higher caliber than now exists.
"c. Increasing adult and community health education programs."

Other health officers dwell more strongly on direct health services to school children. Dr. V. A. Getting of Massachusetts outlines a program including "The development of more adequate services for children of school age including programs for rheumatic fever, cerebral palsy, epilepsy, the hard of hearing, poor vision, and other special groups. The improvement of school health programs, particularly the spaced examination of school children with parents present, the child stripped and 12–15 minutes devoted to each child. Proper follow-up for the correction of such defects as may be corrected and the provision of special facilities for children needing special attention in schools. The increase in facilities for the care of orthopedically crippled children and the immunization of the school child against infectious diseases. Finally the development of a proper curriculum of health education throughout parochial, private, and public schools."

Development of hospital and health center facilities (column 11) is mentioned by 4 states (Alabama, Illinois, New Hampshire, and Wyoming).

Improvement of laboratory service is stressed in Maine, New Jersey, and Wisconsin. Dr. D. Bergsma in New Jersey mentions as special needs, "Rh, and development of bacterial standards and controls to permit better quality control of milk, cream, ice cream, and shellfish supplies." Dr. E. H. Jorris in Wisconsin cites as needs, "broader public health services and research for the diagnosis and control of disease, including virus diseases and the cytological diagnosis of cancer."

Improvement in vital statistics procedures is mentioned by Arkansas, New Jersey, and Ohio. Dr. T. T. Ross in Arkansas stresses the improvement of registration procedures, more thorough analysis of health statistics and service to other divisions of the department. Dr. J. D. Porterfield says: "A neglected basic field in Ohio is that of local records. Practically nothing has been done to provide a standard recommended record system in local units, and its need is obvious not only to improve the efficiency of local units and save the time of local personnel, but to facilitate the provision of reports to the state which are sufficiently extensive to serve as a basis for program analysis and planning."

Special stream pollution control programs are contemplated in Florida and Missouri; special rheumatic fever programs in California and Oregon; special accident control programs in Kansas and Oregon. Dr. W. L. Halverson outlines the proposed California program as follows: "Our third field of endeavor is to develop a service for the diagnosis and treatment of rheumatic fever and rheumatic heart disease. Surveys in our state indicate that this problem is great even though we are supposed to be in a more favorable climatic zone. The Legislature in 1947 requested that a study of the incidence of the rheumatic fever be carried out and that the department should make recommendations to this session of the Legislature. The recommendations are in and we are requesting an appropriation of $900,000 in order to give proper diagnostic and therapeutic services to children falling in this particular disease category."

Dr. F. C. Beelman gives top priority to the problem of accidents, on which he comments as follows: "Although Kansas has done a good job in collecting, studying, and interpreting statistical information on accidents, as yet, we have not aggressively tackled the prob-

lem. It is planned to secure full-time personnel (trained in the field of accident prevention, if possible) to carry out a state-wide program in accident prevention. A part of the program will be to encourage local health departments to develop home safety programs. Accidents—fast pushing their way to the front as one of the leading causes of death—are a community problem in which the local health department should play a major role."

The footnotes to the table indicate eight activities mentioned only once by health officers. They include dental hygiene (Alberta); improvements in control of food production and dairy sanitation (Georgia); "more fair and equitable distribution of state and federal funds" (Kentucky); improved venereal disease control (Maryland); a special health program for the Indian population (North Dakota); two highly specialized types of medical care for specific diseases (Pennsylvania); and expansion of public health nursing facilities (Vermont).

Workers in the old and established field of public health should not be aggrieved because our tabulation contains only one reference to nursing, one to venereal diseases, only three to sanitation, laboratory service, or statistics. The health officers were asked to indicate the *new* things they wanted to do, the expansions specially indicated for 1950. They have given us a highly stimulating picture of the fields opening ahead. The *Journal* and its readers owe a very real debt to the state and provincial leaders who have participated in this symposium.

The Spoils System in Action

"Many of us are often impatient with what is called 'the civil service system' and point to a few jurisdictions where a strong administrator, under an enlightened legislative body and a sympathetic chief executive, is doing an outstanding job of personnel administration without the aid of a civil service law. We are inclined to forget that such an ideal situation is not typical; that in general in this country the patronage system is the alternative to 'civil service.'

"We are also sometimes inclined to forget that a civil service law is not self-executing and that it is never altogether accepted in certain quarters. Selfishly interested individuals and groups are always looking for a way around or through it and are always seizing upon opportunities to discredit it. It is the rare politician who is far-sighted enough to act on James A. Farley's advice that 'When political organizations begin thinking about jobs and nothing else . . . they have commenced their own death chant without realizing it.' That is why over half of our 48 states are still without civil service laws, why excellent laws are in frequent danger of repeal or weakening amendment . . . and why eternal vigilance is necessary to see that in those jurisdictions where good civil service laws are on the statute books they are enforced and well administered.

"What can—and usually does—happen when adequate enforcement and administration are lacking, and when the political chiseling to which civil service laws are peculiarly subject is successful, is shown by the study which the American Public Health Association has made of the Pennsylvania Health Department.

"For those who want facts on the practical workings of a disguised spoils system, we offer extracts from this study, 'Keystones of Public Health for Pennsylvania.'"

[Here follows a digest on the Recruitment of Workers, the History of the Merit System, Permanence of Employment, Political Activity, the Merit System Agency and Conclusions relating to public support and public interest in personnel administration from the A.P.H.A.'s Report on Pennsylvania.]

Good Government, Vol. LXVI, No. 4, July–August, 1949. Pp. 29–30.

Motivation in Health Education*

IAGO GALDSTON, M.D., F.A.P.H.A.

The New York Academy of Medicine, New York, N. Y.

THE subject of my presentation is motivation in health education. I want at the very outset to underscore the fact that I am to deal with two distinctive factors — motivation and health education.

Motivation is a psychological concept, health education on the other hand is a definite discipline and practice. Motivation, defined at its simplest, involves inducing individuals to behave in desired and predetermined patterns. The linking of motivation to health education is rational and obvious. It implies the affecting of behavior of the individual in the directions implied by the contents and objectives of the education in health.

All that I have just said could be summed up in the vernacular of the street, as follows: "*Motivation in health education means how to get people to do the things you want them to do for the sake of their health.*" This vulgar definition, however, does not quite suit our purpose, for we need to establish the fact that motivation and health education, though seemingly a nondisentangleable twain, are really derived from three separate disciplines: motivation from psychology, and health education from the biological sciences, and from pedagogy.

Into the practice of health education there enter, (1) the facts derived from science; (2) the techniques utilized in the presentation of the facts derived from pedagogy; and (3) motivation, derived from psychology. Motivation charges the "lesson" with affect or, to use a not strictly equivalent but more widely understood term—with emotions.

Reviewing the history of health education, one sees that health educators at first were primarily and almost exclusively preoccupied with the presentation of *facts*. Recall, if you can, the days of the early anti-tuberculosis campaigns, when health education was carried on by means of "pickled" tuberculous lungs, exhibited in formalin-containing jars, of electric light bulbs that rhythmically flashed on and off, every flash marking the demise of some poor soul, a victim of tuberculosis; of spotted maps showing the density of tuberculosis deaths; of dismal photographs showing unsanitary tenements, filthy and depressing backyards, and so on. The "health education" of the tuberculosis movement in the first and second decades of the 20th century depended upon the crude, bare, and startling facts, presented without reference to pedagogy, and certainly without thought or knowledge of motivation. The prevailing belief was that facts *starkly* presented, must prove to be the most compelling of arguments.

This belief in the persuasiveness of the bare facts has not been discarded, but is, on the contrary, still widely held. The techniques of presenting the facts are more refined these days, but the greatest bulk of our so-called health education which, be it affirmed, is not *health* education but *disease* education, still reflects the conviction that, if you

* Presented before the Public Health Education Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

but present the facts clearly and correctly, the public *must* become interested, impressed, and persuaded.

This is so pathetic a delusion and so great a folly that we need spend no time in exposing it. The problem here is rather of another order, namely, why do people who are themselves not motivated by facts, believe that others can be, and are, so motivated? I suspect that the answer is to be found in that facts are tangible, but emotions are not, and that we as health educators generally feel safer when dealing with facts than with emotions.

Without intending to single it out as a particularly bad example, but only because it so effectively illustrates my thesis, let us consider the so-called health education in social hygiene. For many decades now the public has been taught that gonorrhea and syphilis are communicable diseases, that they are transmitted from the infected to the non-infected, and that sexual promiscuity is the principal cause of the spread of venereal infection. But I dare say, and recent evidences support what I say, that all the decades of the dissemination of the facts relative to the venereal diseases, have had no appreciable effect on so-called sexual promiscuity, and very little, if any, *direct* effect on the incidence of the venereal infections.

I launched forth on something of a historical recitation on health education, by beginning with the "horror exhibits" of the early anti-tuberculosis movement. To carry this historical sketch further, we need recall that some among the health educators soon became convinced that to educate the public effectively it was not enough to present the facts correctly and clearly; for facts in and by themselves were but little if at all charged with motivation. Then we witnessed a change. The facts were no longer presented stark naked, but were dressed up in emotions. Having myself contributed to that change I can look back upon it with amusement, seeing how utterly naive our efforts were. I can recall employing humorous cartoons —wandering gypsies and other entertainers who, among other tricks, crooned health songs and jingles. We made animated cartoons, played with puppets, and utilized a variety of other popular and appealing "vehicles" to convey our health education to the public.

This second phase in the development of health education was an improvement upon the stark naked fact era. Now facts were sugar-coated with sweet emotions. One might not like to be lectured about green vegetables, or on the need to brush one's teeth, but it is surely more pleasant to listen to the injunctions when crooned in doggerel verse to the tune of a banjo. The lessons on sleep, on rest, on exercise, on the washing of one's hands, and on refraining from spitting, the stock-in-trade of the health educator of that period, were less boring and annoying when presented in a Punch and Judy show than they had been when lecturers, posters, and leaflets literally shook their *injunctious* fingers at one's nose.

All of this is motivation of a kind. It is, what I must call, *Pavlovian motivation*. It is motivation by conditioning. It brings together affects and experiences that are not necessarily, and indeed seldom are, related in normal experiences. It is akin to the original Pavlov experiment in which the conditioned dog salivates at the sound of a bell, a pattern of behavior which, I am sure you will agree, is quite futile and irrational.

Pavlovian motivation is the motivation of the huckster. It is "the trick in trade" of the advertising promoter. It provides the rationale for the pretty face on the magazine cover, for the association of the pretty and pleasant with those things which the huckster wants to sell.

To call this procedure "Pavlovian motivation" is to identify and to de-

scribe its mechanism. But having described it as "Pavlovian motivation" I must rename it to suit our ends better. The application of unrelated or but tenuously related emotions to certain facts is to be termed *exogenous motivation,* that is, motivation stemming from the outside. By the token of this name I am sure you must anticipate its logical opposite—*endogenous motivation.* Such an assumption is quite correct.

The thesis I want to develop is that *effective health education can only be achieved by linking what is to be taught to the endogenous motivation of the person addressed.*

First, however, I should like to spend a little more time on the subject of exogenous motivation.

One of its outstanding characteristics is its tendency to push people around. It tells them with a none-too-successfully disguised imperiousness what they ought, what they should, and what they must, do. It is frequently more authoritarian in tone, than in substance, more righteous than informing. Its effect on a goodly portion of the population is provoking and antagonizing, an effect summed up in the vulgar expression "I say it is spinach and to hell with it."

Analyzing the derivation of this type of health education material, it is seen that the imperious and irritating overtones are practically unavoidable and inescapable. For the origin of the material is almost always of this order. Some undesired and untoward condition is observed, and the health educator sets out to counter-affect it. To achieve this he must try to get people, *nolens volens,* to do certain things. Hence the injunctions "do this! don't do that!" Knowing that people are loath to accept and to respond to such imperious injunctions, health education material is frequently freighted with fear. This quite often results in "horror material." At times the result is painfully apologetic. The health educator, peering out from behind his materials appears to be saying: "I know the facts are unpleasant and I really don't like to force them upon you, but I must, for if *you* don't pay attention to them, and act accordingly, something very dire is likely to happen to *you.*"

Exogenous motivation is motivation by *artifice.* Its operations are seen most clearly in the practices of the huckster. He starts out with a something to sell. He then explores the ways and means by which he can motivate people to part with their money in exchange for what he has to sell. It does not really matter whether the people need what he has to sell, nor whether it is in itself good or bad. His job is to motivate public acceptance of that which he is hired to sell.

The health educator is more idealistic in his intentions and more scrupulous about the overall and ultimate good of what he has "to sell," but his fundamental procedure is about the same as that of the huckster. He, too, starts out with something "to sell." It may be cancer, or the venereal diseases, or oral hygiene, and he too proceeds from there to discover ways by which he may sell his commodity to the public.

If we seek to understand why so much of our health education is exogenously motivated we will find the explanation in the fact that the concepts of dynamic psychology have not yet percolated down to the health educators. Their assumptions as to the psychology of the individual are to be described as static rather than dynamic. They seem to think of their audience as a sleeping beauty, awaiting the animating touch of their educational materials. In reality, however, the normal individual is not passively waiting to be educated, and unless he is in a completely hypnotized state, he is not supinely open to the influences of the health educator.

The normal individual is a motile being, both physically and psychologi-

cally. Any new force that is brought to bear upon him meets with older forces already in operation, and the resultant of the conjunction of the older forces with the new force may be other than anticipated and desired. It is a fact that in planning and in executing our health education services we seldom begin, as we should, by defining the "nature, quality, condition, and direction of motion," of the person whom we propose to educate. We begin rather with the *text*; with the facts to be disseminated, and with the conclusions to be drawn. Such psychology as we do apply in our labors is of the static rather than the dynamic variety. This brings me to the subject of endogenous motivation. This concept is derived from, and is part of, the science of dynamic psychology. Basic to it is the recognition that *the individual is an organism with an innate momentum, whose evolvement and progression follow distinctive and characteristic patterns.* From the time that he is conceived, to the time that he draws his last breath, the individual is impelled by certain characteristic drives. The mosaic pattern of those drives changes from period to period as the individual progresses from intra-uterine to extra-uterine existence, from infancy to childhood, from childhood to adolescence, and so on to the end of his term on earth. In this changing mosaic there are to be witnessed the egressions and regressions of interests, the rise of some, and the decline of other susceptibilities, and a procession of altering wants, needs, ambitions, and curiosities. All these are subject to change in kind, in degree, and in intensity, from period to period, and within any given period from time to time.

In the light of dynamic psychology, the individual is seen to be subject to complex and continuously varying patterns of motivations. Hence to be fully effective, health education must take its cue and draw its guidance from a clear knowledge and appreciation of the inherent, that is endogenous, motivations of the individual, *at the time and in the circumstances in which* the individual is to be addressed.

Let me illustrate the meaning of endogenous motivation by some concrete examples. I will begin with one that dates twenty or more years back. At that time I ruffled the feelings of an earnest health educator who lamented that young women spent more than they could afford on silk stockings (it was silk then and not nylon) and on make-up, and not as much as they should have spent, on milk. Even twenty years ago I was persuaded that milk is a good, a necessary, a valuable food. But I ventured to suggest, and this naturally discomfited the earnest young health educator, that maybe she was wrong, and the young woman was right. For, said I in support of my suggestion, if the primary business of a young woman was to get herself a husband, and if the "cultus" of our age was such that a young woman without a sufficiency of silk stockings, and without adequate make-up, permanents, facials, etc., was handicapped in the matrimonial race, and assuming, of course, that there wasn't enough money available for all these things and milk also, then the young woman was right in sacrificing the milk. Her instincts tell her so, and if she be a normal lass, all your teaching and preaching will avail to naught. The trouble with that health educator was that she thought primarily of milk, and not primarily of the girl. Had she thought of the girl, she would never have permitted herself to be entrapped in so dismal and hopeless an apposition as silk stockings versus milk. She might rather have sought to teach the girl how she might have silk stockings—*and milk also*. Or in true heroic fashion she might even have waited to let true love run its course, and then when it was time to think of "knitting booties," and the

erstwhile young woman had become interested in building a good little body, then perhaps she might have driven her lesson on milk home—*unobstructed,* i.e., by endogenous motivation.

I shall cite some other examples later on. Here I want to introduce another significant consideration which stems from dynamic psychology, and which illuminates the meaning of endogenous motivation.

All health education rests upon the assumption that people prize health and that they are eager to be healthy. Accordingly, our health education is addressed to the individual in such terms as " to be healthy—do so and so "; " if you want to remain healthy—don't do so and so "; " if you want to regain your health—follow such and such instructions." But always—we speak in terms of health, or, to be more precise, sometimes in terms of health and more often in negative health terms, i.e., of disease.

The data of dynamic psychology do not, however, validate the assumption that the individual is eager to be healthy. There is no such instinct, drive, or motivation known to dynamic psychology. The individual wants to eat, to move, to rest, to serve his body's needs. The little boy wants, if he is healthy, to grow big, and strong, to be able to do things, to run, play, to acquire and develop skills. The young man, and the young woman, wants to be attractive, to be liked, to be popular, to have friends, to advance in his or her studies, or works, or ambitions. Grown older, they will want love and sexuality, and marriage, and a home, and children. They will want many things—but they will not want health, i.e., health, pure and simple, unless of course they are hypochondriacs or otherwise mentally and emotionally sick. When sick, they will want to be rid of their illness, but even then not in order to be healthy, but rather to be able to get on with the business of living. There are some—indeed quite a number—who really do not want to get on with the business of living—and so they become and remain sick, while seemingly striving to regain their health. These individuals constitute quite a problem, and they are particularly troublesome to their doctors who strive so hard to help them back to health, and yet succeed so poorly. The fact of course is that unless these individuals can be helped to acquire, or to regain favorable interest in the business of living, they are not likely to become healthy, nor to remain healthy.

It is, of course, true that without health the individual either fails to achieve his " fulfillment "—or does it badly. But there does not appear to be among the basic drives one that can be described as a drive " to be healthy." On the contrary there are some among our basic drives that involve the expenditure of self and the sacrifice of health. Man is not quite like the salmon that swims upstream to spawn and die. But in his make-up there is something remaining of that same primitive overmastering urge to achieve without count of self.

Here then we come upon the crux of endogenous motivation, and perceive its relation to health education. The impulsion to carry on the business of living derives from the basic drives inherent in man. Among these basic drives there is none that can be described as the drive to be healthy. Yet to achieve fulfillment, to be successful in the business of living—the individual needs to be healthy.

Unfortunately, the average individual does not quite appreciate that he needs health for successful living, nor does he know just how health is to be maintained or regained. That is where the health educator's opportunities arise. But, be it noted most clearly, the health educator's opportunities are not there to teach health, but rather to teach the individual

how to attain his immediate goals. Inevitably, since health is one of the prerequisites in the attainment of one's immediate goals—some of the lesson must deal with health.

Bear in mind that according to dynamic psychology the goals of the individual differ and change. The ambitions and drives of the little boy are different from those he will have when a pimply, gawky adolescent, and those of the "lovelorn lass"—from those she will have when safely married and thinking of a family. These differing "goals" constitute the impulsions we have named *endogenous motivations*. They *are* endogenous, for they arise *within* the individual, and they are motivations because they are in fact powerful interests, and powerful driving forces. Health education, endogenously motivated, is founded on the current interests of the person addressed, and is pointed in the direction of his immediate goals. The health data offered are such as will help to advance the individual toward his objectives.

It is proverbial that the lads who will ordinarily brook no restraint on smoking, eating, etc., will, if and when they are "on the team," endure every deprivation. What for? For health? No! For victory! The boy of six cares nothing about calcium and its relation to bone structure. But if you can promise that he will be as big and strong as Popeye the Sailor—if but he eats spinach—spinach he will eat. And again, why? So that he might be healthy? Hardly! But so that he might, like Popeye—be powerful and unconquerable.

Our present health education, however, reveals but little insight into, or interest in, the business of living. It appears to be unaware of the fact that boys and girls, and men and women are troubled and curious about things other than diseases, infections, and their prevention, diagnoses, and treatment.

Once again I select in illustration an example from the social hygiene literature. My example is a booklet addressed to high school students. In it are to be found the "standard facts" about syphilis and gonorrhea—and also the rather distressing statements that syphilis may be transmitted by kissing—and that heavy necking may lead to venereal infection. The text is illustrated with forceful pictures—grim and distressing! It is to my mind a fine example of exogenously motivated health education.

I can visualize the intricate process by which that piece of literature came into being. Someone was earnestly impressed by the need to bring the facts on the venereal diseases to the high school population—and they proceeded to do it. But—I doubt very much that the high school population is really interested in the venereal diseases. I doubt that one could find an endogenous curiosity about syphilis and gonorrhea in the average normal youngster. I doubt that the information conveyed in that type of literature is effective. I am rather inclined to believe that this type of educational effort discredits itself, for either it is disbelieved and rejected (kissing really doesn't spread syphilis; not in the experience of most youngsters, and heavy necking vastly more often leads to marriage than to infection), or it *is* believed and not infrequently produces crippling effects not less serious than the venereal infections, and very much more difficult to cure.

What *does* interest the youngsters in our high schools? Nothing less than this new and beautiful world, its mystery, and its glory.

> O! wonder!
> How many goodly creatures are there here!
> How beauteous mankind is! O brave new world,
> That has such people in't!
> (*The Tempest*—Act V. Sc. I)

Boys interest girls, and girls boys. This new, strange, and rather recalcitrant

thing called love, interests and troubles them. These, and what the coming years have ahead of them, in work and career, are among the inner stirrings, the endogenous motivations of these youngsters. Booth Tarkington, times past, and Archy Andrews, nowadays, well mirror the stirrings of youth, even though reflecting quite correctly more of bathos than of pathos.

An endogenously motivated text on social hygiene, addressed to the high school student, would first and foremost attempt to bring affirmation and assurance. Affirmation that the stirrings of youth, in spite of concomitant embarrassments, confusions, and troubles, are but precursors to the opportunities, achievements, and satisfactions of adult life; and assurance that many of the fears, superstitions, and misconceptions are indeed such. It would name them by name to discredit them. It would offer sound advice on how the youngsters might meet and deal with their common problems, in being and in behavior, and how they might advance and prepare themselves for the great adventures of adulthood. Somewhere in the text there would be mention of the venereal diseases, but only as conditions which impede progression toward youth's goals. Youth is interested in the adventure of living, in love and in achievement. It is not normally interested in the venereal diseases.

I fear that my friends among the social hygiene workers may think me rather carping in my criticism. I will offer them this much of an apology—I chose to illustrate my theme with their texts, not because they were unique in the field of health education—but because they are so strikingly fitting. The faults illustrated are fairly universal. To swing wide for a different example—we might go to *accident prevention,* and there we would witness that most of the "education" centers about the physical and environmental factors which make for accidents. Yet it is a fact, well known in dynamic psychology, *that most accidents are resultants of* the human factor, and that the so-called physical components are but concretizations of the psychological factor. Accidents are seldom due to ignorance. Yet I have seen but little accident prevention material which shows an appreciation of the bearings of inner, that is endogenous, motivations on the occurrence of accidents.

In this instance we come upon the negative phase of endogenous motivation. Up to now I have referred to endogenous motivation as a forward drive, as the impulsion to get on with the business of living. That is correct, but we must recognize the existence also of endogenous motivations which retard, impede, and deflect the individual's progression. We witness this in people's resistance to persuasion and education, in their clinging to superstitions and to old-wives' beliefs and practices, in their susceptibility to quackery, and in their espousal of bizarre movements and causes. Even in normal development there is to be witnessed a great deal of ambivalence. It's true, that the little boy wants to grow big, but witnessing his little sister being cuddled, he will want also to reclaim his place on the reassuring lap of his mother.

Many a man who takes pride in being a father, at the same time "resents sharing his wife with his children." Many parents who want their children to grow up still hobble them with excessive supervision. The woman, and the man, who reaches menopause, suffers from more than an endocrine imbalance. And touching upon this, I recall a piece of literature addressed to the older generation, which was entitled, *Don't be your Age,* and I wondered why. Why not be your age and like it?

Health education, to be effective, must appreciate the negative as well as the

positive endogenous motivations, and must take account of them in its plans and activities.

These negative phases are not the product of ignorance, nor are they to be dissipated by a direct attack—"fact in hand." The antivivisectionist is not to be persuaded by a recitation of the achievements of laboratory research, and the woman who is sure that the massage given to her by a quack provides the medicine she really needs, may be quite right, in the light of the particular distortions which affect her life.

Here I must wind up my argument, and I must do so by first offering an apology in the sense of explanation, as to why I have been so critical and censorious of our current health education practices and materials. In part I feel free to do so because the indictment embraces me no less than the other fellow. Also I recognize that the health educator labors under certain disabilities which, to a large measure, relieve him of blame.

Early in my presentation I made note that much of our health education is in effect disease education. Here precisely is the dilemma which impales the health educator, for though he is called health educator, his job, the job for which he is paid, is in the main to teach disease rather than health. This is so not because he is derelict and stubborn, nor because his superiors and associates are such. The fact is that modern health education has taken its cue from modern medicine; and modern medicine, I regret to say, has long been, and still is, more preoccupied with disease than with health.

Here one might properly ask, why then belabor the health educator? In justification I must offer two considerations: First, that the future of the health educator is bright, and his opportunities are greater than ever before. And I would have us miss out on none of those. And, second, I recall that the modern health education movement, whose origin I date at about a century ago, was vastly ahead of the then modern medical science and practices. Indeed, as I have pointed out on previous occasions, e.g., in "Humanism and Public Health" (*Annals of Medical History,* 1941—Boston Medical Society), some of the far-seeing vision of the pioneering public health movement was actually obscured by the advent of the etiological school of medicine with its ideas on specific etiologies and specific therapies.

Role of the Voluntary Agency in the Overall Health Program*

J. LOUIS NEFF, F.A.P.H.A.

Executive Director, American Cancer Society, Texas Division, Houston, Tex.

IN these days of changing values, with more and more emphasis being placed upon the functions of government and less and less upon the responsibilities of the individual, it is important that we stop and take stock, and attempt to evaluate an institution so distinctly American and so thoroughly "free-enterprise" as is the idea of a nonofficial, self-constituted group voluntarily assuming responsibility in a matter as important to the state as is the health of its citizens.

It should be pointed out that the voluntary health agency as we know it today is distinctly a phenomenon of our own western civilization: it is as American as pork and beans, free elections, and universal free public school education. Nowhere else in the world do we find public spirited people banding themselves together for the strictly altruistic purpose of serving their neighbors and their communities as is done in the United States. In other countries the support of such movements seems to partake to a much greater extent of a governmental or semi-governmental nature.

An interesting example of this partial or total dependence upon governmental assistance is found in an article published in the *Texas Cancer Bulletin*[1] describing the use of postage stamps as a fund raising device. It seems that in support of programs of cancer control, 13 countries have issued no less than 76 postage stamps. Some countries have used regular postal issues for this purpose; others have issued postal tax stamps which do not pay postage, but which must be placed on every letter passing through the mails during certain restricted periods. Still other governments have used semi-postal stamps, that is, stamps which are sold for a premium over their face value; the premium goes to the cancer fund. Similar stamps have been issued in these and other countries for the support of programs of maternal welfare, the care of the crippled child, the control of tuberculosis, and for other medical and public health activities. No such stamp has ever been issued in the United States. The various stamps or "seals" which are sold for such purposes in this country are strictly unofficial in character, issued by voluntary agencies.

In 1945, a study of American voluntary health agencies[2] reported the existence of 16 national, 290 state or regional, and 20,248 city or county groups engaged in 17 major fields of health activity, and estimated that there were some 300,000 board and committee members concerned with their management. This is a force to be reckoned with. For good or for bad, the weight of their influence cannot be ignored. If they are bad, so is it bad to have free speech, free assembly, free enterprise and initiative, and a government responsible to the people, rather than a

* Presented at the 24th annual meeting of the Texas Public Health Association, San Antonio, Tex., February 21, 1949.

people responsible to a government. Just how good they are depends upon what they have done in the past, what they are doing now, and upon whether there has been developed a satisfactory substitute for them. Let us attempt to evaluate the idea of nonofficial voluntary health agencies with these points in mind.

The voluntary agency with which I am affiliated here in Texas uses the triangle to illustrate the idea of the interdependence of the three groups from which we recruit our leadership, both state-wide and in our local units. The arms of the triangle are on the one hand the business or professional layman who helps us raise our money and supervise its expenditure; and on the other side, the leader of women to whom we look to recruit, train, and supervise the vast army of volunteers which is essential to the program we are undertaking. The base of the triangle we insist must be a physician, because upon him rests the responsibility for knowing and interpreting the local needs and resources of his community and their relationship to the state and national picture. To him also we look as the coördinator of the efforts of the other two sides of the triangle, to make certain that our program remains on a sound, scientific, and ethical foundation. We conceive of this triangle as being an equilateral triangle with each side of equal weight and importance, because without the financial support of the public and the devoted enthusiasm of the volunteer workers, the efforts of the physicians to reduce the unnecessarily high mortality from cancer would be difficult if not impossible.

The triangle to us represents a form of unity, continuity, interdependence. Each of the three sides we conceive of as a unity within itself, but until they become joined together as a triangle they do not realize their full potentiality of strength, union, and mutual assistance so vital to our success. Each comes into contact and joins forces with the other in a program of mutual respect, assistance, and effort—and in a situation of mutual dependence, for the triangle would cease to exist if one of the arms were removed.

Why cannot the symbol of the triangle be applied with equal validity to a description of the place the voluntary agency should occupy in the total health program?

The ultimate responsibility for the care of the sick person, whether as a unit or as a group, must rest on the shoulders of the practitioner of medicine. It is he who comes into contact with the patient; it is he who determines in a very large measure what is done to or for the patient, and whether in a given instance there shall be applied the sum total of the available knowledge, skill, and physical facilities for the relief of his suffering, the healing of his body—or for the protection of his neighbors, if the patient happens to be suffering from a communicable disease. Because this ultimate responsibility for the care of the patient and for the direct application of any public health program thus in large measure falls to the practitioner of medicine, let us make the physician the base of our public health triangle. Then let us designate the voluntary health agencies as one of the other arms. Now let us finish the triangle by considering the local, state, regional, and national official health agencies as constituting the third arm of our symbol.

So that we may form an estimate of what has been accomplished by the national voluntary health agencies, what may be expected from them in the future, and whether they should form one arm of an equilateral triangle which is completed by the practising physicians and the official, governmental, health agencies, let us look for a moment at two of these distinctly American institutions which are among the leaders in point of size: the National Tuberculosis Association because it is the oldest, and

the American Cancer Society because it is the most recent to reach the "big size" category.

When the National Tuberculosis Association was formed in 1904, this disease was claiming close to 200 lives out of every 100,000 inhabitants of the United States. People for the most part refused to mention the disease by name, referring to it as consumption, a decline, or a lingering illness. Tuberculosis hospitals were almost a thing unknown. The first tax-supported hospital for tuberculosis patients in the United States[3] had been opened in 1897 in Cincinnati, Ohio. Massachusetts in 1898 had led the way with the first state sanatorium, inspired by the successful demonstration of the value of such care made by Bowditch at Sharon, Mass. Of course, Trudeau had blazed the trail with his Little Red Cottage at Saranac Lake, N. Y., in 1885, and other pioneers were attempting to preach the doctrine of rest, nourishment, and isolation. But, for the most part, persons suffering from tuberculosis were permitted to die untreated, huddled closely with others of their family in sanitary conditions best designed to facilitate the passing on of the chain of infection.

Despite overwhelming evidence that the control of tuberculosis in the individual depended upon a type of rest and nursing care difficult to secure except under hospital conditions; despite irrefutable statistical proof that the control of the disease in a community depended upon early and strict isolation of every patient capable of infecting his neighbor, the growth of the sanatorium idea was slow and difficult. The history of the National Tuberculosis Association is full of records of valiant fights made by local groups of volunteers banded together with their local physicians, and of their ultimate success in securing the establishment of adequate institutions for the care of these patients, and the enforcement of suitable regulations regarding the reporting of the disease and the control of the infectious patient. Today, the philosophy of early case finding, prompt treatment, and adequate supervision is accepted without argument, and effective control programs are in progress from coast to coast. The tuberculosis death rate has dropped from the 200 per 100,000 reported at the turn of the century, to 33.2 per 100,000 in 1947.[4] The credit for this dramatic result must be given in very large measure to the vision, the courage, the enthusiasm, and the unflagging efforts of the National Tuberculosis Association.

But who builds these hospitals; who administers these control measures? Not the National Tuberculosis Association nor its affiliated local units. For the most part this is the function of the city, county, state, and federal governments. Who uses the institutions? Not the board members of N. T. A. nor its local groups. No, the institutions are used by the practising physicians who send to them the patients whom they find to be suffering from the disease.

Thus we have the public health triangle: the medical profession pointing out the need; the voluntary agency creating the public demand; the official agency supplying the facilities to meet the need and satisfy the demand; the three arms of the triangle joining together to take care of the sick citizen and a health threatened community. But this unity and this continuity do not end here: the doctor through the use of the facility and the voluntary agency through its continued efforts, give to the official group the backing they need to secure popular support for the continued appropriation of the tax funds necessary for the support of the program. So we have again the equilateral triangle of mutual respect, assistance, and effort—and again the situation of mutual dependence, with each arm of the triangle requiring the support of each of the others.

Let us now turn to the American Cancer Society, the newest of the national voluntary health agencies to achieve large stature. This agency was founded by a group of physicians and scientists who were convinced that they knew enough about the diagnosis and treatment of cancer to make a material reduction in its death rate if only some way could be found to bring patients under adequate treatment at an earlier stage of the disease than that in which it was usually being seen by those qualified to treat it. Although organized in 1913, its real growth in terms of money raised did not start until recently. The survey of health agencies mentioned above[2] credits this organization with having raised $150,288 in 1943. Five years later, in 1948, the American public contributed a total of some $13,090,000.

This explosive growth was due in part, of course, to the reorganization of the Society which was started in 1943, but this growth and even this reorganization were made possible only by the persistent hammer, hammer, hammer of the pioneer workers in this field. Like the early members of the antituberculosis groups, these early cancer workers found the disease cloaked in a conspiracy of silence. Fear, superstition, ignorance, and social tabu combined to make the very word unmentionable, and attempts at public education or other control measures were unpopular in the extreme. It is only within the past two or three years that cancer has been mentioned as the cause of death in an obituary notice. When the society was organized, such a death was considered a family disgrace which had best be overlooked in the interest of common decency and a charitable sympathy for the survivors. The money spent for cancer control by official agencies was negligible. Research into the nature, causes, and methods of effective treatment of the disease were isolated, sporadic, and pitifully inadequate.

Today, 25 per cent of every dollar contributed to the American Cancer Society is allocated to the support of a national research program under the supervision of a special Committee on Growth of the National Research Council. One-fourth of $13,000,000 is an impressive figure, but this is by no means the only money now being spent for cancer research. Spurred on or inspired by the activities of this voluntary agency, the governmental appropriations for this purpose have increased in truly significant fashion.

But research is not the only practical and productive avenue of approach to the cancer problem. Research is needed, to be sure, but enough is now known to cure at least a third of the close to 200,000 annual victims if public education were backed by adequate facilities. The bulk of the American Cancer Society's money goes for these elements of the control program.

Here also they are being joined by the official agencies. As an illustration: The National Cancer Institute, an activity of the Federal Security Agency, was organized in 1937, in large measure through the urgings and assistance of the American Cancer Society and of the group of scientists who comprised its directorate. The budget of this federal agency for each of the first two years was $400,000. By 1949 the annual appropriation by Congress had risen to $14,000,000 and the Institute had enough funds to permit it to allocate to the several states no less than 2½ million dollars to permit the state health departments to increase their cancer control activities.[3] Texas's share of this distribution was $115,590.

This federal money is by no means the only money allocated from tax funds for cancer control, including research. State health departments and state supported institutions becoming interested in cancer control are today the rule rather than the exception. Texans may

well be proud of the fact that when their state legislature established the M. D. Anderson Hospital for Cancer Research in Houston they charged it with responsibility not merely for the care of cancer patients but also for the conduct of cancer research and of programs of cancer education.[6] The importance of its research functions was symbolized by its very name; its educational responsibilities were emphasized by the fact that the hospital was made part of the University of Texas, and not part of the state's welfare or charity program.

If this dramatic increase in tax supported cancer control activities is not the result of the pioneer efforts of the American Cancer Society, then it must be recognized as a remarkable coincidence that such sudden increase in tax support coincided with the equally dramatic success of the society in its other fields of activity.

So again we have the public health triangle: A group of doctors dissatisfied with their results and seeking help; a voluntary agency leading the way in efforts to secure the help the doctors were seeking; and finally the governmental agencies rallying to the support of both groups with the resulting creation of a powerful, effective, and increasingly successful instrument for the control of a serious health problem. But again we have the situation of mutual dependence, for the physician through the use of the facility and the voluntary agency through its continued program of education must maintain in the minds of the public a willingness to back the official agencies in their continued requests for tax support.

Time does not permit the presentation of other examples of how this triangle works. Numerous other health agencies present similar pictures of effort and of success. Perhaps this evolution of the triangle can be considered one of the outstanding developments of the first hundred years of public health in America. Is it too much to hope that in the next hundred years we may see a further development and solidification of this idea?

Hospitalization of Cases of Communicable Diseases Together with Certain Considerations of the Isolation Techniques and Nursing Procedures Used*

ALFRED L. BURGDORF, M.D., M.P.H., F.A.P.H.A.
Director of Health, Hartford, Conn.

THE hospitalization of cases of communicable disease has always been a problem to the hospital administrator and to the public health official.

The *1948 American Medical Association Directory of Hospitals* lists 65 isolation hospitals with a bed capacity of 12,556. These bed listings of isolation hospitals have the lowest occupancy rate of any other hospital category—43.6 against 77.1 for general hospitals. There are only 18 states that have special isolation hospitals. These naturally are all supported by official funds operated as a city, a county, or city-county function. By far the majority of the separate isolation hospitals are located in populous states east of the Mississippi River. Seven states—Massachusetts, New York, Pennsylvania, New Jersey, Michigan, Wisconsin and Illinois—account for 71 per cent of such separate facilities. In many instances such isolation hospitals, designed and built for acute contagious diseases, are used partially for housing tuberculous or chronically-diseased patients. Questionnaires sent to 41 such isolation hospitals representing 15 of the 18 states were returned in 15 instances from 8 states. In 1931 there were 86 isolation hospitals registered. This number has fluctuated since then with a low of 52 in 1941 and 1942, to a high of 86 in 1931, with a median of 61. It is to be noted that the number of persons admitted to such hospitals doubled in 1945 over that of 1944 (48,387 to 99,599) and in 1946 made a 49 per cent increase and in 1947 an 11 per cent increase. In no other 4 year period were such consistent increases in admissions seen during the past 17 year period. No other service division showed a comparable increase in admissions during this last 4 year period. This is especially significant, in view of the fact that these same facilities showed the lowest occupancy rate as noted above.

It would appear, that since the isolation hospital is found in relatively few places and since the general hospitals must offer some service for the contagious case of one sort or another, be it in a separate wing, a special ward, or even a group of isolated rooms, there is need for establishing a set of minimum standards or procedures.

Questionnaires were sent to 126 general hospitals located in all of the states in the Union. Hospitals were selected with bed capacities of 200 or more. In certain states there were no hospitals

* Presented to the Committee on Research and Standards of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass. (revised), November 10, 1948.

of that size. In such instances the largest hospitals were selected. Seven states had no hospital of 200 beds or more. Replies were received from 60 hospitals (47.6 per cent of those queried), representing 30 states. It would appear that the distribution of the states replying is such as to give a fair representation of practices throughout the country.

Queries were also sent to the 48 state health officers to establish whether any state laws existed covering the admission or isolation procedures of hospitals admitting or caring for cases of communicable diseases. Replies were obtained from 35 state health officers. In general, most state health officers point out that there are no laws covering the admission practices or isolation procedures for cases of communicable diseases. In only 6 states is there more than a very general statement about the required provisions in handling contagious diseases in hospitals. Indiana and Massachusetts have the most explicit requirements of all states replying to this inquiry. Sanitary Codes in many instances do have special references to hospital control measures as they apply to epidemic diarrhea of the new-born.

Not a few of the state health officers expressed the opinion that at the present time the general hospital should accept cases of communicable diseases.

Fifty-nine of 60 replies from general hospitals lent themselves to analysis.

I. ADMISSION POLICY

a. admits all types of cases	26	
b. admits certain types of cases	27	
c. admits no communicable diseases	6	
	—	59

Eighteen of the 33 hospitals that did not admit all cases of communicable diseases stated that patients who developed a communicable disease after admission were transferred to another hospital for care.

Five of the 59 general hospitals analyzed stated that they contemplated some change in their policy of admission, indicating that new quarters were being added, or that some additional disease categories would be opened to admission such as poliomyelitis, etc. Forty-seven indicated that no change in policy was contemplated. In several instances it was indicated that the policy was dictated largely by public opinion rather than by scientific fact or medical conviction. It would seem that where the concept of the "pest house" had been well established, the fear of admitting contagious diseases to general hospitals runs strongest.

The facility of the general hospital most commonly used for cases of communicable diseases was the medical floor. The distribution of the various communicable disease entities in the two types of hospitals according to the facility employed is shown in Table 1.

The general hospitals which admitted only certain types of cases showed a fair consistency, since cases of typhoid, paratyphoid, amebiasis, bacillary dysentery and food infections were admitted with comparable frequencies as were pneumonia and influenza—27 and 25. Poliomyelitis was admitted only to about 50 per cent of the institutions. Some of the low rates of acceptability may have been due to the fact that this disease did not occur in all sections of the country. It was interesting to note that two hospitals would not admit trichi-

TABLE 1

	Special Wing	*Separate Building*	*Medical Floor*	*Pediatric Service*	*Special Room*	*Special Ward*	*Other*
Gen. Hosp. admitting all patients	320	155	492	32	143	521	79
Gen. Hosp. admitting certain patients	135	114	621	48	147	131	7
Total	455	269	1,113	80	290	652	86

nosis or tetanus. It was equally significant that only 6 hospitals of the 27 admitted scarlet fever, but 22 admitted streptococcic sore throat. Leprosy was not acceptable to 20 hospitals, rabies to 11, actinomycosis to 10, and anthrax to 17. It was reassuring to see that the syphilitic was persona grata in 22 of the 27 hospitals.

II. ISOLATION PROCEDURES

A. *Eating utensils*—It was a common practice of all hospitals admitting communicable diseases (53) to *handle dishes separately*. In one instance the reply was equivocal and in another it was stated that the separation applied only to certain specific diseases.

B. *Linen*—Forty-nine of the 53 hospitals admitting contagious diseases also *handled the laundry separately*. Three stated they did not and in one instance no statement was made.

C. *Bed Pans and Urinals*—Forty-eight of the 53 hospitals stated that they had a special procedure for sterilizing the bed pans and urinals used for cases of communicable diseases. Four stated that they used no special precaution other than that used for all such equipment, with the exception that in one instance special procedures were used for typhoid and dysentery. Twenty-three stated that the same equipment after cleaning or "sterilizing" was used for other patients; 24 said they were stored separately. Six did not report one way or the other. There was a great variety of ways in which bed pans and urinals were made "safe" after being used for cases of communicable diseases. Methods and frequencies used were as follows:

a. washing plus sterilizer	30	
b. boiling for lengths of time 5–30 minutes	13	
c. autoclaving	7	
d. simple washing	1	
e. application of chloride of lime	1	
f. not stated	1	
	—	53

In addition, in 11 instances some of the procedures mentioned above were combined or creosol or lysol was additionally applied.

D. *Wearing of masks*—37 stated that masks were worn routinely, with these qualifications: 3 stated that they were worn only for respiratory diseases; 4 indicated that it depended on the disease; and 1 stated that they had trouble in getting their physicians to wear them.

Of the 15 who stated that masks were not routine, one stated that it was required for cases of tuberculosis, and 2 hospitals required it for tuberculosis, diphtheria, meningitis, and scarlet fever.

One made no report.

E. *Dishwashing*—There was tremendous variation in the methods of washing dishes.

Twenty-five used boiling alone for 5-30 minutes. In 5 instances the additional statement was made that paper cups alone or paper cups and plates were also used.

In 8 instances, boiling from 10 to 30 minutes plus another procedure was used, such as steam at various pressures and for various lengths of time, automatic rinsing, soap and water, and soaking in lysol.

Six hospitals reported steam alone. Here there was considerable variation, from just steam without any reference to time or pressure to 25 lbs. for 20 minutes. Here too in 2 instances partial paper service was used.

Automatic dishwashing alone was the practice in 8 institutions with 8 different techniques employed with variables of time and temperature. Other miscellaneous methods were noted in 6 hospitals:

1. washed in "sterilizer" in sterile solution (?) for 20 minutes plus automatic dishwasher.

2. hot water at 150° F. for 20 minutes.

3. lysol for 20 minutes—washed in water plus soap—steam at atmospheric pressure for 20 minutes.

4. complete disposable paper service in 2 instances and in several other cases some paper service was used in conjunction with another method.

F. *Laundry*

a. *Collection.* Fifty hospitals stated that all communicable disease laundry was collected in separate containers. (Type containers used were paper, mesh bags in clean hampers, galvanized cans, etc.)

One hospital added it to other laundry after a chemical soak; and in 3 hospitals the additional fact was added that the collection was done by orderlies.

In 2 instances no statement.

In reply to a specific question as to the use of common chutes, replies were yes 16; no 29; not stated 8.

b. *Sterilization*

1. Site of sterilization
   - 1.1 laundry—42
   - 1.2 fumigation plant—1
   - 1.3 separate room—1
   - 1.4 on the floor—2
   - 1.5 bacteriological department—1
   - 1.6 university laundry—1
   - 1.7 not stated—5
2. Method of sterilization
   - 2.1 steam alone—5
   - 2.2 washed with other linen—5
   - 2.3 washed separately—4
   - 2.4 chemical treatment—10
     Lysol (3), $HgCl_2$ (1), $KMNO_4$ (1), Nuzon (1), 2% Chlorine (1), Antiseptic in N_2O (3)
   - 2.5 autoclaving—2
   - 2.6 washing at high temperatures—6
   - 2.7 multiple washings—1
   - 2.8 boiling—8
   - 2.9 not stated—12

III. NURSING SERVICE

Twenty-three general hospitals indicated that the same nurses cared for communicable as well as for non-communicable diseases; 29 stated that two different groups of nurses were used. One made no statement.

Forty-six institutions reported that the nurses caring for contagious cases were trained specially in communicable disease nursing and isolation technique; 6 hospitals had nurses who were not trained in such technique, and 1 did not report.

The source of training was reported as follows: on the job—35; affiliation in a communicable disease hospital—8; postgraduate course—1; not stated—2.

The replies on the length of training were extremely varied and showed no discernible pattern.

REVIEW OF MEDICAL ASEPTIC OR ISOLATION TECHNIQUES

In a review of a representative sample of aseptic techniques employed in this country, it would appear that, by and large, a very wide margin of safety is maintained beyond that required by the nature of the diseases handled and not justified by the recorded observations.

The techniques are directed toward controlling:

1. admission of the patient
2. location of the patient in regard to other patients
3. immediate hospital environment
4. actions of personnel caring for the patient
5. the actions of persons visiting the patient
6. all articles with which he comes in contact and which pass out into the service part of the hospital or back to his home
7. disposal of excretions and secretions
8. the disinfection of the individual upon discharge

Admission of the Patient

There is fair uniformity in the fact that a recognized case of communicable disease should be admitted directly to his room and if this is not done that the general admitting room remove covers from tables, stretchers, etc., and that instruments used in the diagnostic procedures be "sterilized."

The Location of the Patient in Regard to Other Patients

Measles, chickenpox, and smallpox are regarded as the greatest offenders in cross-infections and it is generally agreed that such patients might very well be treated with great respect and wherever possible kept to themselves. There is

further agreement that spacing beds—5 to 6 feet apart is adequate to defeat spread of disease by droplet infection. No mention is made of the use of vapors or specific methods of handling floor dusts. No specific references are made to fixed intervening walls between patients.

Immediate Hospital Environment

There are few discrepancies here also in defining the clean and contaminated objects about the patient; although considering the patient with tetanus, trichinosis, and undulant fever in numerous instances as having a contaminated hospital environment is not in keeping with the known facts. In several hospitals the contaminated area is held to include corridors outside of patients' rooms which might be considered a product of over-caution.

Action of Personnel Caring for the "Contagious" Patient

The gown technique, hand washing, the separation of clean and contaminated articles within the contaminated area or unit is the closest approach to "standard." However, there is great difference expressed in the number of gowns needed to carry out this program. One manual stated that "a gown will be discarded following each use unless a limited supply is available." [*Sic!*]

There is also no unanimity about the use of masks. The opposing viewpoints are brought into sharp focus in one large hospital, where two medical schools work the same hospital wards. The written hospital procedures require that all staff and students from "University A" wear masks when in direct contact with the patient. For "University B" masks worn by the staff are optional since it was felt by that group that the wearing of a mask gave a false sense of security.

Whether there is any value in the mask as far as protecting the patient from a "parasite laden" attendant needs further clarification. Little mention is made of the type of mask although it has been pointed out in the literature that impervious masks merely deflect and therefore do not protect, and that a mask to be effective must fix organisms in its meshes. The wet mask is universally condemned. There is variation in the recommended methods of washing it.

Action of Persons Visiting the Patient

The majority of opinion is that visitors properly gowned may sit within 6 feet of the patient, and that they should bring in nothing with them that they expect to take away.

ARTICLES WITH WHICH THE PATIENT COMES IN CONTACT AND WHICH PASS OUT INTO THE SERVICE PART OF THE HOSPITAL OR BACK TO THE HOME

At this point there is the greatest amount of contradiction. The provisions set up are by no means absolute. In the care of instruments used on patients, non-cutting ones are washed with soap and water before autoclaving; cutting instruments, however, are soaked in alcohol or some other substance. Rubber goods such as ice caps, hot water bottles, rubber rings, rubber sheets, rubber pillows, all articles which may become grossly contaminated, are washed with soap and water before air-drying. On the other hand, the linen is soaked in disinfectants, boiled or specially laundered with a variety of detergents, bleaches, and alkalis. Dishes are subjected to long periods of boiling, steam under pressure, or any one of many sterilizing or antiseptic procedures.

The extremes to which linen is sterilized or rendered "safe" in hospital practice is generally above and beyond the procedures employed in commercial laundries, which unknowingly must receive laundry from homes in which carriers of infectious agents or cases of

recognized or unrecognized disease have contributed to the laundry bundle.

Destruction of toys and books frequently advocated does not appear to be in keeping with the washing and drying of rubber sheets and their re-use.

The washing of eating utensils is handled in so many different ways that there must be confusion in the minds of persons responsible for composing the employed techniques. The frequently mentioned use of single service utensils was noted. Its economy certainly might well be explored. Recently reported unfavorable bacteriological reports on commercial automatic dishwashers raises doubts upon placing reliance on some of the techniques employed in connection with them.

Disposal of Excreta

The use of paper in various forms appeared to be almost universal for the disposal of discharges from the nose and oropharynx. Urine and feces were frequently treated with chloride of lime or some other chemical before disposing of it through the public sewer. The need for this chemical treatment in a public sewerage system might profitably be explored in view of the fact that recognized and unrecognized carriers are undoubtedly contributing daily to the sewage disposal plant varying amounts of parasites.

Dependence upon bed pan sterilizers where steam is used at atmospheric pressures does not mean that bactericidal temperatures are developed.

Disinfection of the Patient on Discharge

There appears to be good uniformity in this matter.

Too frequently no mention is made in the techniques reviewed of immunization procedures for the protection of personnel.

SUMMARY

1. Some of the procedures in the hospital and public health fields in regard to isolation procedures for the care of communicable diseases appear to be archaic.

2. There is an economic need for devising adequate and simple facilities as well as safe techniques for the hospitalization of communicable diseases in general hospitals.

3. There are contradictions in the admitting policies of some general hospitals as far as communicable diseases are concerned.

4. Some of the isolation techniques appear to need simplification, revision and in several instances deletion.

RECOMMENDATIONS

1. The American Public Health Association has a responsibility to guide the development of modern facilities and practices for the economical hospital care of communicable diseases.

2. It would be helpful if a committee were set up, consisting of a representative from the Laboratory, Engineering, and Epidemiology Sections of the American Public Health Association, representatives of the American Academy of Pediatrics, and of the American Hospital Association to consider simplifying the physical requirements for isolation units so that they can become an integral part of the general hospital, and to outline in simple terms the basic requirements for isolation techniques that will be in keeping with present knowledge of infectious disease.

Tuberculosis Clinic Organization and Practice*

ARTHUR B. ROBINS, M.D., DR. P.H., F.A.P.H.A.

Director, Bureau of Tuberculosis, New York City Department of Health

IN 1904 Dr. Hermann M. Biggs presented a paper on the administrative control of tuberculosis before the Henry Phipps Institute in Philadelphia. In his address, Dr. Biggs outlined a 10 point program which included compulsory registration of all cases of tuberculosis, free laboratory diagnosis, home supervision of cases not under the care of private physicians, economic assistance to tuberculosis families, and the provision of free dispensaries, hospitals, and sanatoria for cases of tuberculosis. In the 44 years that have elapsed since Dr. Biggs spoke in this city none of the steps in his program has been eliminated and very little new has been added.

The most significant change has occurred in the function of the tuberculosis dispensary or clinic. In its early days, the tuberculosis clinic operated either as an independent institution or as part of the outpatient department of a hospital. As such, it was concerned only with the case of tuberculosis and its contacts and played a minor role in the general health services of the community. The location of tuberculosis clinics in district health centers and the development of generalized nursing service changed all this. The tuberculosis clinic of today is just one link in the chain of public health services available to the community on the basis of the family unit. As such, it is more closely allied to the school health service, the industrial medical service, and other community health and preventive medical activities than it is to the hospital devoted solely to treatment. The use of health centers for periodic health examinations and more complete diagnostic investigations will further emphasize the separation between clinic and hospital. In fact, our clinics are now regarded as chest clinics rather than tuberculosis clinics, and are so called.

This change in the function of the clinic is reflected in its organization. Until 1943, all of the physicians in our clinics served on a part-time basis. Their primary interest was the private practice of medicine, and the responsibility of the physician-in-charge of a clinic was almost entirely confined to its clinical supervision. Since 1943, we have been placing our clinics under the direction of full-time physicians-in-charge who are exepected to do more than act as clinic supervisors. The full-time physicians are being trained to serve as district tuberculosis administrators. In this capacity, they are expected to carry on epidemiological studies, develop tuberculosis control programs, teach preventive medicine to medical students, and assist the district health officer in the coördination of our services with other community health activities. They are given every encouragement to take training in the field of public health for which funds are made available.

Improved statistical methods have been developed to help realize these objectives. Reports on the cases of tuber-

* Delivered at the Annual Meeting of the Association of Tuberculosis Clinics in Philadelphia, May 25, 1948.

culosis in each district are forwarded regularly to a central tabulating unit where they are transcribed on punch cards. Statistical analyses are made available to the district administrators to enable them to appraise the extent of their problem accurately and identify the individual cases requiring special attention. It is planned to apply similar techniques to the analysis of clinic records in the near future.

The principle of increasing the participation of the chest clinic in the health activities of the community is also carried out in our x-ray service.

The majority of the chest x-ray surveys done by the Bureau of Tuberculosis in New York are arranged with the district health center and all of the cases who require supervision receive it through the district clinics and nursing offices. A substantial proportion of the x-rays of groups of apparently healthy individuals are taken in the local chest clinics and this practice will soon be greatly expanded by the installation of photo-fluorographic equipment in several of our larger centers.

When the tuberculosis clinic was primarily concerned with the examination of cases of tuberculosis, contacts, and individuals with pulmonary symptoms, it operated on the basis of a uniform procedure. Each patient received a reasonably complete history and physical examination and was asked to return for an individual report. As other groups were included, and newer x-ray techniques were developed, this procedure was found to be neither necessary nor practicable. The separation between the dual functions of the clinic, case finding and case supervision, became more apparent. Our present clinic practice is based increasingly on a recognition of this distinction.

Case finding in tuberculosis is fundamentally a screening method. It calls for the roentgenological examination of the largest possible number of individuals in those groups in which the most tuberculosis will be found. In this category are recent contacts to infectious cases of tuberculosis, individuals with significant pulmonary symptoms, particularly those referred by private physicians, and those portions of the population which have high morbidity and mortality rates. In most such cases an elaborate history and physical examination of the chest contribute little. The principal value of the history is in the evaluation of the nature of the contact and in the differential diagnosis of cases in which significant changes have already been found by x-ray.

Our present standard medical record is a form on which biographical data, information on exposure to tuberculosis, and pertinent history, physical and laboratory findings are entered. The same form can be made a part of a continuous record for patients with pulmonary disease or contacts requiring supervision. Despite this advantage there has been a strong tendency in our service toward the wider use of the simple identification card designed only for survey patients. As the proportion of our clinic case load referred for routine chest x-ray increases, and 70 mm photo-fluorography is extended more widely, the use of this card may justifiably become the accepted practice for all types of clinic patients, except cases with known pulmonary disease.

Contacts present a special problem in that they are subjects for both case finding and case supervision, depending on the definition of "contact." and the standards of supervision followed. If the term "contact" is used to include all the associates of cases of tuberculosis, only a small proportion require supervision. Part of the contact group is examined in an attempt to find the source of infection, for which purpose a single x-ray is sufficient. The examination of most of the other contacts is done because of their consanguinity with

cases of tuberculosis. While the significance of hereditary factors, as demonstrated so brilliantly in the animal experiments of Lurie, and the twin studies of Reisner and Kallmann, is recognized, we do not feel that long-range supervision on the basis of blood relationship alone is practicable. Consequently these individuals too are x-rayed only initially.

The only type of contact receiving periodic x-ray examination in our service at present is the adolescent and young adult who has been exposed to an open case of pulmonary tuberculosis within the preceding two years. An open case of pulmonary tuberculosis is defined as a case with positive sputum or evidence of cavitation by x-ray.

Once the contact has been broken individuals who fail to react to tuberculin are not supervised further. Recent studies, however, indicate that even in this sharply restricted group of contacts most of the cases of tuberculosis are found on the first examination. Until such time as source cases are diagnosed earlier in the course of their disease, periodic supervision of contacts will probably continue to be a procedure of limited value. A simple record, on which the history of exposure and the results of the x-rays can be entered, would seem to be adequate for the case finding examination of all groups.

The clinic supervision of diagnosed cases of tuberculosis presents quite a different problem. Ideally, the only type suitable for clinic supervision is the arrested case. In practice, a substantial number of patients with active disease come under clinic observation. Almost all of them are individuals who refuse to enter a hospital or have had a period of institutional care and have left against medical advice. For most of them, little is accomplished by clinic supervision. The more coöperative patients in the group receive some benefit from medical care and the opportunities for health education which go with it. An occasional case of this type gets well while ambulant. The less coöperative patients continue to be a danger to themselves and the community and should be compelled to accept treatment or at least isolation. Clinic supervision should never be allowed to become a substitute for institutional care in the management of active tuberculosis.

The majority of the cases of tuberculosis attending our clinic are in the arrested stage, and the number is growing larger with the expansion of the mass x-ray survey program. The standards in accordance with which these cases are supervised represent a compromise between the theoretical ideal in which every case of tuberculosis is followed indefinitely and the practical limitation of available facilities. Those patients recently discharged from institutions are watched closely, at 6 month intervals for at least 5 years. In most instances, however, the lesions are discovered in the course of routine x-ray examination and may have been stable for years. Such cases are supervised less rigidly and many are discharged after relatively short periods of observation.

The technical procedures used in our services reflect our basic philosophy in regard to case finding and case supervision. The admission history taken on individuals examined for the purpose of finding tuberculosis consists of little more than the necessary identifying data and the essential facts in regard to exposure in the case of contacts. No physical examination is done, sputum is not collected, and the tuberculin test is omitted. An x-ray of every patient is taken by the cheapest and most efficient method available. For the past five years the *Magazine Cassette,* which provides rolls of fifty paper 14 x 17 films, has been used in all of our clinics and has proved entirely satisfactory. When the clinic volume exceeds 15,000 x-rays annually, photo-fluorographic equipment

is to be preferred. All films are interpreted in accordance with a 3 digit numerical code which greatly simplifies their classification. Individuals not in need of further study do not return for a report, and their x-rays and records are disposed of immediately.

On the other hand, all of the resources at our command are utilized for the patient who requires supervision. A complete history is taken, and a physical examination of the chest is done. Sputum specimens are routinely obtained and examined after concentration, and gastric lavage is performed on those patients who are without expectoration. The radiological workup includes fluoroscopy of new patients, x-rays in special positions when indicated, bronchography and even body section radiography. Every effort is made to arrive at an accurate diagnosis and appraisal of the patient's condition.

Similar completeness is aimed at in the records of cases under clinic observation. The interpretation of each film is entered on the x-ray record in addition to the code diagnosis. The latter, which was originally designed solely for x-ray findings, has been expanded so that it now serves as a clinical classification. All of our statistical tabulations are based on this code, and the 3 digit number has become the universal language of doctor, nurse and clerk in our service. The clinical records and x-rays are retained in the local clinic as long as needed and are then sent to a central storage point. Here they are photographed on micro-film and kept indefinitely. Copies of both records and x-rays are made and returned to the field units on request. In this way an opportunity is provided for the evaluation of the status of every case of tuberculosis over an indefinite period.

Additional assistance for the patient with tuberculosis is provided in the clinic through the public health nurse and rehabilitation counsellor. Every newly diagnosed case is interviewed by a conference nurse who is specially trained to help in explaining the physician's recommendations, arranging for hospitalization or other medical care, and making necessary social and economic adjustments. Rehabilitation counseling is a new service in our clinics and is still in the phase of exploration. It has already demonstrated its value for arrested cases of tuberculosis and will probably become a basic part of our program.

I hope this brief presentation has indicated that the pattern of clinic organization and practice is not a static one. Procedures now in use in our clinics reflect changes that have occurred in the course of almost half a century of continuous operation. These changes have resulted from the adoption of a broader concept of the place of the chest clinic in the general community health program, differences in the character of the clinic population, and improvement in our scientific knowledge. Further modifications are to be expected with the development of new methods of prevention and treatment suitable for application in the clinic. At present, our clinic services are organized to find and supervise cases of tuberculosis, and their practice is designed to best serve this dual function.

Safety and Effectiveness of Multiple Antigen Preparations in a Group of Free-Living Children*

V. K. VOLK, M.D., DR.P.H., F.A.P.H.A.
County Health Commissioner, Saginaw, Mich.

THE effectiveness of many immunizing agents and the apparent trend toward combining two or more antigens suggested a need for a careful study of multiple immunization from the standpoint of safety, frequency of reactions, and effectiveness. In June, 1943, a study was undertaken to determine the safety and effectiveness of immunization with various multiple antigen preparations.

In a previously published paper,[1] a report was made on the safety of multiple antigen preparations and the frequency of reactions among children and adults in institutional groups following injection of these preparations. Many of these had been previous artificial immunization experiences. In that paper, the plan and procedure of the study were described, and the premises outlined on the basis of which various antigens were combined. The present paper describes the results obtained in free-living school children, none of whom by history had received active artificial stimulation by injection of antigens.

This paper will deal essentially with the effectiveness of multiple antigen preparations containing diphtheria, tetanus, and pertussis antigens, as indicated by the height and duration of diphtheria and tetanus antitoxin response according to blood titrations, by the protection secured against whooping cough as measured by the agglutination test and by the results of an epidemiological survey. Some of the preparations used also contained scarlet fever toxin and typhoid fever vaccine, but the effectiveness of these two antigens will be discussed in subsequent publications. In this paper, we are reporting also on the frequency of reactions following injection of multiple antigen preparations.

This study was made with the coöperation of an advisory committee composed of Drs. Franklin H. Top, Chairman; W. L. Bradford; F. S. Leeder; John J. Phair; Philip M. Stimson; John A. Toomey; Milton V. Veldee, and with the assistance of W. E. Bunney, Ph.D., as special consultant.

The author gratefully acknowledges his indebtedness to Franklin H. Top, M.D., for his valuable assistance in the preparation of this paper.

This study was made possible by an annual grant made by E. R. Squibb & Sons, who also provided all the biologic preparations.

We wish also gratefully to acknowledge the technical assistance and untiring efforts of Maud G. Gilbert, R.N.; Mrs. Nina Rhees Smith, and Miss Marian K. Bartlett, of the study staff; the helpfulness of Dr. Donald T. Fraser, of the University of Toronto, Toronto, Canada; and of Dr. August Holm, of the E. R. Squibb & Sons Laboratory staff, in performing laboratory tests; the assistance of Mr. William Young, Mr. Raymond Ilgen, and Mr. Edward Hammis of the Saginaw County Health Department staff in preparing charts.

* Presented before the Multiple Antigen Committee of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

METHOD

Multiple antigen preparations were administered to a group of free-living children attending the rural schools of Saginaw County, which covers an area of about 1,000 square miles.

The preparations which made this study possible were obtained from E. R. Squibb & Sons, and are listed below showing the antigens of which each preparation was composed:

No 4391-2-3 COMBINED ANTIGENS
Diphtheria toxoid, A.P.
Tetanus toxoid, A.P.
Pertussis vaccine, 10,000 million per ml.
Scarlet fever toxin, tannic acid precipitated—
Dose 1: 750 S.T.D. per ml.
Dose 2: 3,000 S.T.D. per ml.
Dose 3: 10,000 S.T.D. per ml.

No. 4394-5-6 COMBINED ANTIGENS
Diphtheria toxoid, A.P.
Tetanus toxoid, A.P.
Pertussis vaccine, 10,000 million per ml.
Typhoid vaccine, 1,000 million per ml.
Scarlet fever toxin, tannic acid precipitated—
Dose 1: 750 S.T.D. per ml.
Dose 2: 3,000 S.T.D. per ml.
Dose 3: 10,000 S.T.D. per ml.

No. 12892 COMBINED ANTIGENS
Diphtheria toxoid, A.P.
Tetanus toxoid, A.P.
Pertussis vaccine, 30,000 million per ml.

The age groups of children who received multiple antigen preparations are shown in Table 1.

It is apparent from Table 1 that 84 per cent of the children were from 6 to 10 years of age, and only 11 per cent were in the preschool age group. It would have been preferable to inoculate children in the preschool group, but the obvious difficulty in keeping such children under continuous observation after injection made it necessary to utilize children in the next standard age group.

EVALUATION OF REACTIONS

The method of observation and evaluation was similar to that described in the previous paper; but, for the reader's convenience, it is described briefly as follows:

Method of Observation and Evaluation

Evaluation of reactions was made by one nurse who observed the inoculated children for 11 days after the injections were given and longer when necessary. The observations included a daily inspection of the arm for local reactions, of skin for rashes and evidence of systemic manifestations; and when indicated the temperature was taken daily until a normal level was attained. For the sake of uniform interpretation, the Advisory Committee[4] defined reactions as follows:

Local Reactions:
Mild (tenderness detectable on pressure, small area of redness)
Moderate (tenderness in using arm, large area of redness)
Severe (arm so painful it is not used)

General Reactions:
Mild (temperature not to exceed 100° F.)
Moderate (temperature not to exceed 102° F.)
Severe (temperature over 102° F.)

In addition to temperature, the severity of

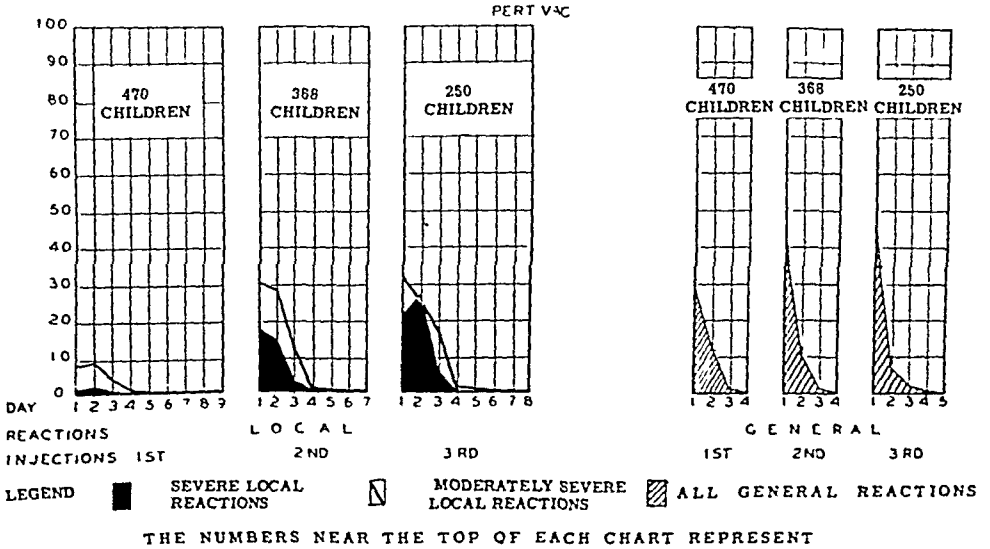
systemic manifestations, such as general malaise, vomiting, and rashes, was considered in evaluating the degree of general reactions. No mild local reactions are reported, because they are not considered important.

As can be seen in Figure 1, local reactions were infrequent in these free-living children after the first injection of 0.5 ml. of a three-antigen preparation but became more evident after the second and third 0.5 ml. injections of the same preparations.

A group of children who received 1 ml. doses of the same preparation for the second and third injections (Figure 2) had more frequent local reactions than those who received the 0.5 ml. doses (Figure 1). General reactions following 0.5 and 1 ml. injections of the three-antigen preparation were quite similar, and in over 90 per cent of the cases were mild in character. Only a very few children had a general reaction which could be considered as moderate or severe. These observations are in line with those reported in a former paper.[1]

We observed no development of "antigenic cysts" among the free-living group immunized with multiple antigen preparations. The term "antigenic cyst," although not entirely satisfactory, was suggested for use in preference to the term "sterile abscess" which was considered unsatisfactory because it was believed that in a great majority of the cases this abscess-like development was a sensitivity reaction.



In a previous paper,[1] we reported the reactions following use of a four-antigen preparation in a group of free-living children. As might be expected, the frequency of both local and general reactions was slightly higher following the four-antigen preparation than after use of the three-antigen preparation.

COMMENTS

As a result of the observations of local and general reactions in a group of free-living children reported in this paper

FIGURE 1

REACTIONS FOLLOWING INTRAMUSCULAR INJECTIONS OF CHILDREN WITH 0.5 ML. OF ANTIGEN PREPARATION NO. 12892 DIPH TOX AP TET TOX AP PERT VAC

and of those previously reported, it appears that we are justified in reaffirming our previous conclusions that the multiple antigen preparations are safe and that the relative frequency of local and general reactions should not discourage public acceptance of the multiple antigen procedures.

EFFECTIVENESS OF MULTIPLE ANTIGEN PREPARATIONS

The group of children used in the study, as far as we know, had not been previously inoculated against diphtheria and tetanus. Prior to inoculation, contacts were made with the parents, and only children who had no history of previous immunization were accepted in the study group. At the time of the first injection, 76 per cent of the entire group had less than 0.001 unit of diphtheria antitoxin and 24 per cent had more than 0.001 unit.

When a group of free-living children was studied in 1945, we were not able to obtain blood samples for titration in a number of cases, because some shipments of vacuum tubes used for this purpose were defective. Parents usually were present when blood samples were taken, so we sometimes felt obliged to abandon efforts to secure blood samples after trying a succession of vacuum tubes which proved to be defective. As a result in 24 per cent of the children in our study no pre-injection titer was obtained, although as stated before, all of them gave history of not having had previous immunization. Post-injection titers were obtained on the entire group. We have analyzed separately the results obtained in groups with and without pre-injection titer and found complete agreement in antigenic response; therefore, we combined these groups for the purpose of simplifying this report.

OBSERVATIONS ON DOSAGE

As shown in Figures 1 and 2, the groups receiving 1 ml. injections had a higher percentage of reactions than the children who received 0.5 ml. For this reason we abandoned 1 ml. injections. Previous experience had shown us that the size of a dose in each instance could be safely reduced if the number of injections were adequate.[2] Since we were using three injections at 1 month intervals in this study, we anticipated adequate antigenic response from the 0.5 ml. dose. Judging by the results of the few 1 ml. doses given, responses were comparable following injections of 0.5 and 1 ml. of multiple antigen preparations. This was shown in two groups composed of 39 children who received two injections of the three-antigen preparations. Twenty-one children received 0.5 ml. at each injection, and 18 received 1 ml. at each injection. All children in these two groups had less than 0.001 unit of antitoxin at the time of first injection. In the group of 21 which received 0.5 ml. doses at each injection, all but 2 showed an increase in antitoxin level; and two-thirds of this group had more than 0.1 unit 4 months after the first injection. In the group of 18 children receiving 1 ml. doses at each injection, 3 failed to respond at the end of 4 months. Of those responding, two-thirds had more than 0.1 unit of diphtheria antitoxin. These two groups were observed for 46 months and maintained their diphtheria antitoxin level remarkably well. Although the groups are small, the results were consistent at all times; consequently we considered them reasonably conclusive.

These observations confirmed our previous conclusions in the diphtheria study; namely, that dosage is not of great significance if an adequate number of injections are given. We are therefore not reporting separately the results among children who received a course of 0.5 ml. and those who received 1 ml. injections.

OBSERVATIONS ON EFFECTIVENESS OF INDIVIDUAL ANTIGENS

The effectiveness of multiple antigen preparations can be determined most readily by measuring the antigenic response to each of the individual antigens. The effectiveness of the diphtheria and tetanus antigens used in the various multiple antigen preparations was uniformly consistent and comparable, and for this reason the results were combined. These are shown in subsequent tables and charts.

RESPONSE TO THE DIPHTHERIA ANTIGEN WHEN USED IN MULTIPLE ANTIGEN PREPARATIONS

Immunity response to the diphtheria antigen used in multiple antigen preparations was determined only by blood serum titrations. As in previous studies [2-4] the Schick test was not used because the test itself has an antigenic effect, especially on a child with previous diphtheria inoculation experience. Elimination of the Schick test in determining immunity response to diphtheria made it possible—

1. To observe comparative antitoxin response to the various injection procedures.
2. To determine the duration of the response without additional secondary stimulation.
3. To determine the response to be expected in routine examinations when the Schick test is not used.

The children were bled before they were given any antigenic stimulation and 4 or 5 ml. of blood were obtained from each child with vacuum tubes. As many as possible of these children were bled again in 4 to 6 months and at various intervals for the duration of the study. To determine the immunity response to diphtheria, the blood samples were titrated by a method similar to that reported in previous immunization studies.[2]

We did not test for a higher titer than 1 unit. The test range for each serum was 0.001, 0.01, 0.1, and 1 unit, as the immunity status of the donor was not known to those performing the titrations. Toxin dilutions were made in physiological salt solutions, as no difference between results was obtained with toxin diluted in this manner and toxin diluted with Fraser's buffer diluent. Toxin dilutions were made fresh before each titration. The amount injected into each rabbit was 0.2 ml. because the readings were more distinct than when 0.1 ml. was injected. Comparative tests with 0.2 ml. and 0.1 ml. gave identical results. The reading time was 48 to 72 hours; most often, 48 hours.

We first analyzed the data on children who had less than 0.001 unit of diphtheria antitoxin at the time of the first injection. In other words, the group was non-immune with a few exceptions. Results are shown in Table 2.*

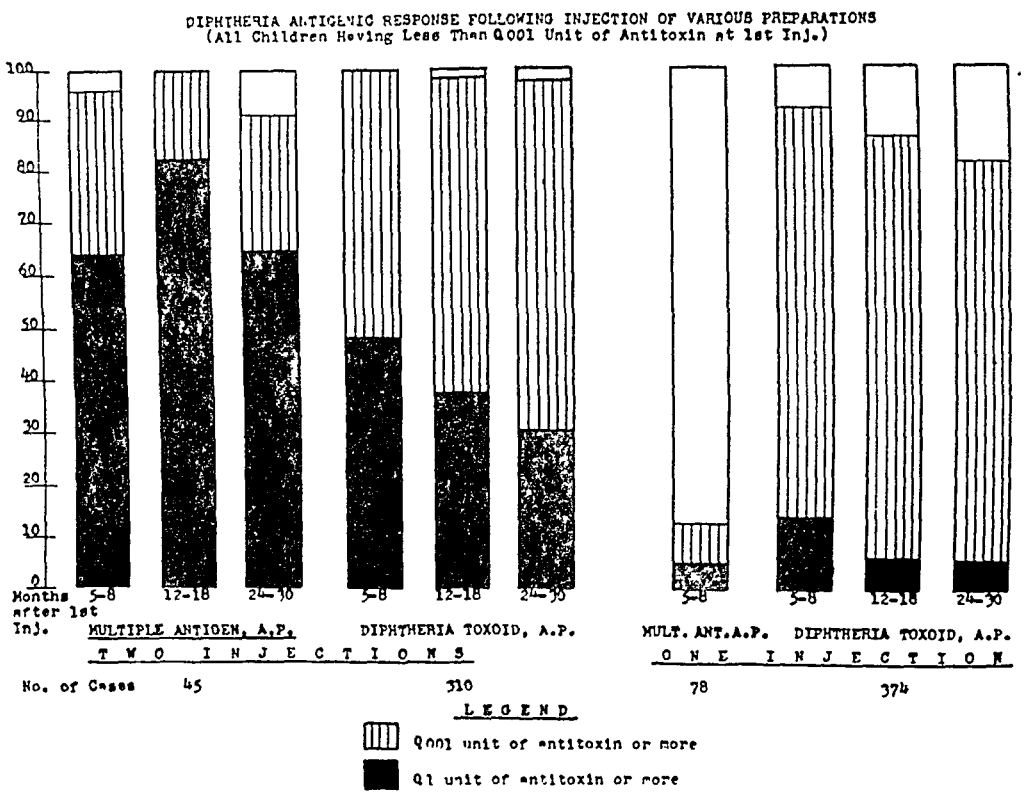
Observations Following One Injection
(Children having less than 0.001 unit of diphtheria antitoxin at time of injection)

It was shown clearly that the diphtheria antigenic response was extremely low 5 to 8 months after one injection. The resulting figures show that 57 of 66 children (86 per cent), failed to respond at the end of 6 months (see Table 2 and Figure 3). This is in marked contrast to the results obtained after only 1 ml. injection of diphtheria A.P.T. (alum precipitated toxoid) alone, where 92 per cent of the children responded to antigenic stimulation after a comparable period.[2] Yet the study groups were comparable in every respect because the diphtheria incidence was extremely low during the two periods, and the percentage of school children having less than 0.001 unit at the time of injection was comparable as can be seen from the following:

In our previous study,[3] in a group of 1,800 children 80 per cent had less than 0.001 unit at the time of injection. This compares with 74 per cent of the children having less than 0.001 unit in the study herein reported. It is quite possible that the difference in response may be explained by the fact that a dose of 10 L_f (Limes flocculation units) of diphtheria A.P.T. is not enough for a single inoculation procedure. (See discussion of observations following three injections).

Observations Following Two Injections
(Children having less than 0.001 of diphtheria antitoxin at time of first injection)

The response following two injections of the multiple antigen preparations shows marked improvement (see Table 2 and Figure 3) compared with that after one injection. In a group of 45 children receiving two injections, 90 per cent responded to diphtheria antigen stimulation by exhibiting an antitoxin level of 0.001 unit or more 30 months after injection, 80 per cent maintained an antitoxin level of 0.1 unit or more during an observation period of 12 months.



The results after two injections of diphtheria A.P.T. contained in a multiple antigen preparation indicate that, as shown in Figure 2, Table 3, diphtheria A.P.T. combined in a multiple antigen preparation produces a more satisfactory response, as measured by higher antitoxin level, than when diphtheria toxoid is given alone.

Observations Following Three Injections
(Children having less than 0.001 of diphtheria antitoxin at the time of first injection)

* Every effort was made to give the children three injections of the various preparations; however, occasionally, it was impossible to do this. Those children who did not receive the complete set of injections were observed to determine the diphtheria antigenic response after one or two injections only.

The titration work was done by Dr. August Holm, of the E. R. Squibb & Sons Laboratory; and certain check samples were sent to Dr. Donald T. Fraser, of the University of Toronto, whose findings were in close agreement with those of the E. R. Squibb & Sons Laboratory.

FIGURE 3

The diphtheria antigenic response resulting after three injections of a multiple antigen preparation was consistently satisfactory as shown in Table 2 and Figure 4.

It is important to note that diphtheria toxoid, when used alone, contained 20 L_f per ml. and was given in *two 1 ml. doses,* whereas the diphtheria A.P.T. used in multiple antigen preparations contained 18 L_f per ml. but was given in *three 0.5 ml. doses.*

A careful study of Table 2 and Figure 3 reveals that a higher percentage of children had 0.1 unit or more of diphtheria antitoxin after injection of multiple antigen preparations containing diphtheria A.P.T. than the children receiving A.P.T. alone. It shows too, that in the study group which received three injections, 85 per cent still had 0.1 unit or more of diphtheria antitoxin 24 months after injection. In a group which received three injections of diphtheria fluid toxoid alone, only 16 per cent had 0.1 unit or more 24 months after inoculation; yet, the children receiving multiple antigen preparations were given 9 L_f per injection while those receiving only diphtheria toxoid fluid were given 20 L_f per injection.

RESPONSE IN CHILDREN HAVING 0.001 UNIT OR MORE AT TIME OF INJECTION

The response to the diphtheria antigen among children already having 0.001 unit or more at the time of injection of multiple antigen preparations was uniformly excellent. This is shown in Table 3. Of the 1,211 blood samples taken from this group at different intervals from 6 to 48 months after injection of multiple antigen preparations, only 10, or less than 1 per cent, had less than 0.001 unit of diphtheria antitoxin per ml. and only 2 per cent had more than

2 injections 40.4
3 injections 58.4

0.001 unit and less than 0.1 unit. Over 97 per cent had more than 0.1 unit.

Comments on Efficacy of Diphtheria Antigen

(In children having <0.001 unit of diphtheria antitoxin at time of first injection)

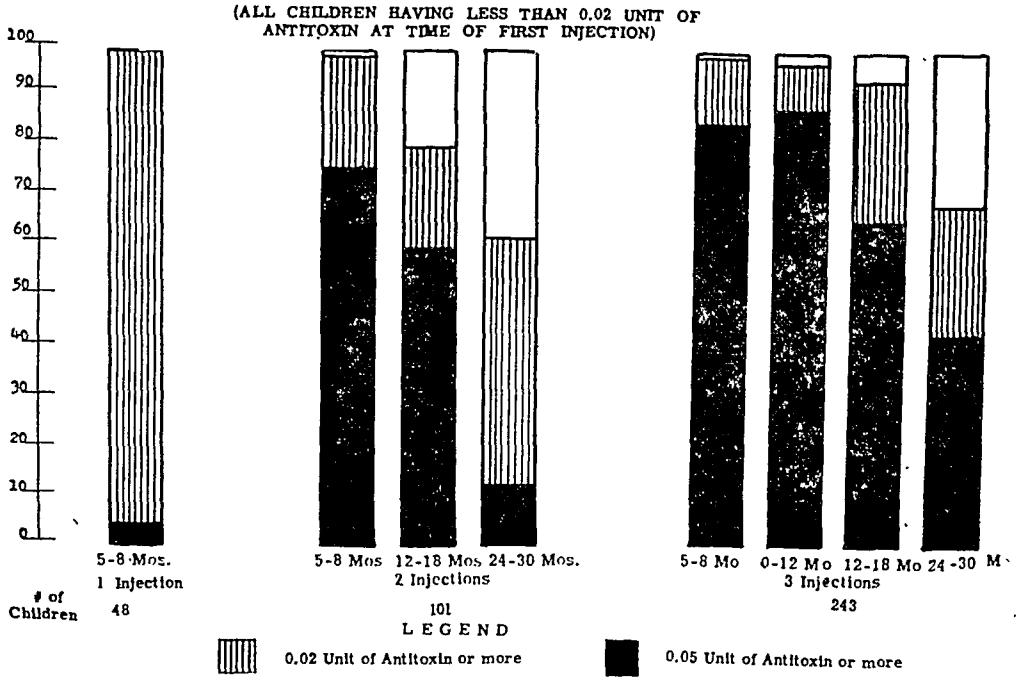
Antigenic response to the diphtheria antigen contained in one injection of a multiple antigen preparation used in this study is not adequate.

Two injections produce an excellent diphtheria antigenic response as evidenced by the fact that 80 per cent of the children had more than 0.1 unit of diphtheria antitoxin 18 months after injection. A slow drop in antitoxin level has been noted at the end of 30 months after injection.

Diphtheria antigenic response following three injections of the multiple antigen preparation containing diphtheria antigen, A.P.T., was superior to all other results observed. The diphtheria antitoxin level was over 0.1 unit in 95 per cent of the children at the end of 18 months, with a reduction to 83 per cent at the end of 30 months after injection.

The diphtheria antigenic response in children having 0.001 unit or more of diphtheria antitoxin after the first injection is excellent, as over 97 per cent of the children had over 0.1 unit at the end of 48 months of observation.

In our opinion the efficacy of the multiple antigen preparations containing diphtheria antigen as an immunizing agent against diphtheria is striking indeed as compared with that of the diphtheria antigen when used alone. Kendrick [6] and Bell [8] made similar observations.



RESPONSE TO TETANUS ANTIGEN FOLLOWING INJECTION WITH MULTIPLE ANTIGEN PREPARATIONS

Immunity response to the tetanus antigen used in multiple antigen prep-

FIGURE 5

TETANUS ANTIGENIC RESPONSE FOLLOWING INJECTION OF MULTIPLE ANTIGEN PREPARATIONS

(ALL CHILDREN HAVING LESS THAN 0.02 UNIT OF ANTITOXIN AT TIME OF FIRST INJECTION)

arations was determined only by blood serum titrations. The test used is an adaptation of the mouse method given by Glenny and Stevens (*J. Roy, Army M. Corps* 70:308, 1938).

In determining the response to the tetanus antigen, we studied children having less than 0.02 unit of tetanus antitoxin at injection. We arbitrarily considered the 0.02 unit indicating a non-immune status. As with the diphtheria antigen, we evaluated the effectiveness of the tetanus antigen after one, two, and three injections.

Observations Following One Injection (Children having less than 0.02 unit of tetanus antitoxin at time of injection)

Table 4 and Figure 5 demonstrate that tetanus antigenic response after a 5 to 8 month interval following one injection of the multiple antigen preparation containing tetanus toxoid, A.P.T. is better than that produced by diphtheria A.P.T. also contained in the preparations. Although the single injection elicited mild antigenic response in all of the children (all of whom had 0.02 unit or more, and 6 per cent of whom had more than 0.05 unit), we consider the protection given against tetanus inadequate after one injection of these preparations. We have no data concerning the tetanus antitoxin level in this group beyond 8 months after injection.

Observations Following Two Injections (Children having less than 0.02 unit of tetanus antitoxin at time of injection)

Results obtained following two injections of a multiple antigen preparation containing tetanus A.P.T., are shown in Table 4 and Figure 5. There is a very marked improvement in the antitoxin level as compared with that obtained from one injection. The data indicate that 60 per cent of the children had 0.05 unit or more of tetanus antitoxin at the end of 18 months, but that from then on the titer rapidly decreased. For this reason every effort should be made to give at least two, or preferably three, injections to maintain protection against tetanus.

Observations Following Three Injections (Children having less than 0.02 unit of tetanus antitoxin at time of first injection)

The results obtained after three injections of a multiple antigen preparation containing tetanus A.P.T., were satisfactory (Table 4 and Figure 5). Of the children, 66 per cent had 0.05 unit or more of tetanus antitoxin at the end of 18 months, but afterward this level steadily decreased, with the result that 30 months after inoculation only 43 per cent of the children had 0.05 unit or more of tetanus antitoxin.

RESPONSE IN CHILDREN HAVING 0.02 UNIT OR MORE OF TETANUS ANTITOXIN AT THE TIME OF INJECTION

The response to the tetanus antigen among children having 0.02 unit or more of tetanus antitoxin at the time of the first injection of a multiple antigen preparation was good, although not as good as the response to the diphtheria antigen. Blood titrations at different intervals from 6 to 46 months after the first injection indicate that 95 per cent of the children had 0.02 unit or more of tetanus antitoxin at post-injection testings. Satisfactory diphtheria response, as mentioned elsewhere in this paper, approximated 99 per cent in a group which had 0.001 unit or more of diphtheria antitoxin at the time of the first injection.

COMMENTS ON EFFICACY OF TETANUS ANTIGEN

Mild tetanus antigenic response following one injection of a multiple antigen preparation was noted in all of 48 children observed at the end of 5 to 8 months. The group was small, and in

5	5,000 millions	3	41	22	19	16	14	5	23
			%	53	47	53	47	16	83

all cases the antitoxin level was less than 0.05 unit.

The tetanus antigenic response following two injections was marked at the end of 8 months after the first injection. However, 18 months after the first injection a moderate reduction in antitoxin level was noted, and it was further reduced at the end of 30 months.

Three injections of a multiple antigen preparation containing tetanus antigen is more effective than two injections; however, 18 months after the first injection a reduction in antitoxin level was noted and at the end of 30 months there was a marked reduction (88 per cent). This suggested that the reinforcing (booster) dose is necessary between 24 months and 36 months after the initial injection series. The antigenic response to tetanus toxoid in a group of children having 0.02 unit or more of antitoxin at the time of first injection was maintained in 94 per cent of the inoculated at the end of 18 months and in 69 per cent at the end of 30 months.

RESPONSE TO PERTUSSIS ANTIGEN AFTER INJECTION WITH MULTIPLE ANTIGEN PREPARATIONS

Unfortunately we do not have a test giving as exact information on the effectiveness of the pertussis antigen as does the test available for determining diphtheria and tetanus antigenic response. For evaluating the pertussis antigenic response, the agglutination test was used. Although it is generally agreed that the positive test indicates antigenic stimulation, there is no way to determine whether a positive titer indicates protection against pertussis. Table 4 and Figure 6 show the percentage of conversion from negative to positive after one, two and three injections of pertussis antigen, A.P.T., contained in multiple antigen preparations.

In addition, an attempt was made to evaluate the effectiveness of the pertussis antigen by observing the frequency of the disease among inoculated children following intimate or remote exposure to a case of pertussis. This was done in the following manner:

Parents of children who received the multiple antigen preparations which contained pertussis were contacted in an effort to learn:

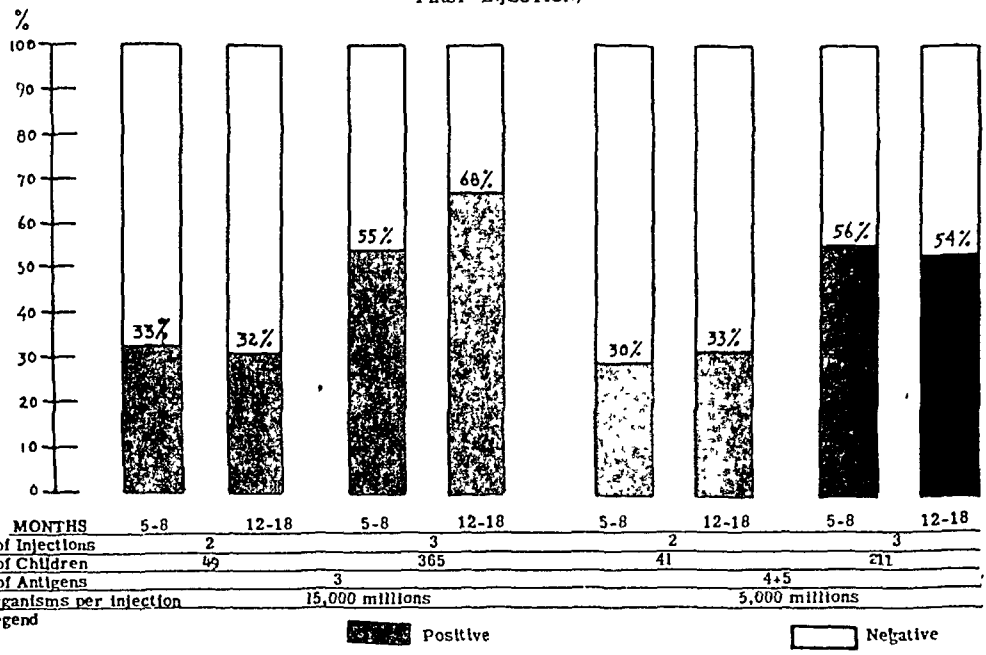
1. Whether their children had pertussis before inoculation.
2. Whether their children had been exposed to whooping cough after injection.
3. Whether their children contracted the disease.
4. Whether the illness was severe, moderate or mild.

Observation on the Agglutination Test After One Injection

Conversion of the agglutination test from negative to positive was observed in about 23 per cent of the children 5 to 8 months following one injection of a multiple antigen preparation containing pertussis vaccine, A.P.T. (5,000,000,000 organisms per 0.5 ml.) (Table 5 and Figure 6).

Observations of the Agglutination Test After Two Injections

Conversion of the agglutination test from negative to positive was observed in about 30 to 33 per cent in the inoculated group 5 to 8 months after two injections of a multiple antigen preparation containing pertussis antigen. Two groups of children receiving various pertussis antigen preparations tested 18 months after the first injection showed that about one-third still remained positive.



Observations on the Agglutination Test After Three Injections

In three large groups of children who received three injections of a pertussis vaccine of 5,000 million and 15,000 million organisms per injection in various multiple antigen preparations, the percentage of children who gave positive reactions at the end of 5 to 10 months

FIGURE 6

OPSONIC RESPONSE AT DIFFERENT INTERVALS AFTER INJECTION OF CHILDREN WITH MULTIPLE ANTIGEN PREPARATIONS CONTAINING PERTUSSIS ANTIGEN

(ALL CHILDREN HAD NEGATIVE AGGLUTINATION TEST AT TIME OF FIRST INJECTION)

was 55 per cent. This percentage was maintained at the end of 18 months, but was reduced at the end of 24 months after the first injection.

EPIDEMIOLOGICAL OBSERVATIONS ON INCIDENCE OF WHOOPING COUGH AMONG THE INOCULATED

Of the group of 802 children in our study, 47 children were reported as having been exposed to whooping cough some time after injection of multiple antigen preparations; 44 children had been exposed but did not develop the disease. Of the 3 children who contracted the disease, 2 had a mild course, and 1 was moderately ill. All of the 3 children developed pertussis between 6 and 12 months after receiving the first three injections of a multiple antigen preparation. Two of the 3 children who had the total dosage had a negative agglutination test 6 months after completion of a multiple antigen preparation and 1 had a positive test.

COMMENTS

The antigenic response following one injection of a multiple antigen preparation containing pertussis antigen was not great, judging by the results of the agglutination test. Two injections showed a higher percentage of positive titer and three injections of a multiple antigen preparation containing pertussis antigen resulted in a still higher percentage of positive agglutination test. A reversion in the agglutination test from positive to negative was marked at the end of 24 months after the injection of multiple antigen preparations. If the agglutination test is a valid test of antigenic stimulation, reversion of a large proportion of the inoculated group at 24 months suggests the need for booster injections in about two or three years.

A multiple antigen preparation containing 15,000 million pertussis organisms per injection appeared to be more effective than one containing 5,000 million pertussis organisms.

Laboratory results and field observations in our study corroborate the findings of Kendrick[7] and Bell[9] that the pertussis antigen in multiple antigen preparations is an effective immunizing agent.

SUMMARY

1. On the basis of our observations we recommend that the injections of multiple antigen preparations be given intramuscularly because the development of antigenic cysts is greatly lessened by using this route of injection.

2. On the basis of the observations of local and general reactions in a group of free-living children reported in this paper and of observations previously reported, we are reaffirming our previous conclusions. The multiple antigen preparations are safe, and the relative frequency of local and general reactions should not discourage public acceptance of the multiple antigen procedures.

3. The present study indicates that 0.5 ml. per injection of the antigens used in this study is effective if two or three injections are given a month apart. One injection of a multiple antigen preparation is not adequate, but two injections produce very good results and three injections produce superior results; therefore, a three-injection series is the procedure of choice.

Health workers and private physicians should be made aware that one injection is inadequate, and every effort should be made to give each child at least two injections.

The decrease in tetanus and diphtheria antitoxin levels in the course of 3 years and the reversion from positive to negative in a high percentage of cases in the agglutination test suggest the advisability of giving a booster dose about two to three years after the initial inoculation.

The *in vitro* Test for Virulence of *Corynebacterium diphtheriae*

ELIZABETH O. KING, MARTIN FROBISHER, JR., F.A.P.H.A., AND ELIZABETH I. PARSONS, F.A.P.H.A.

Communicable Disease Center, Federal Security Agency, Public Health Service, Atlanta, Ga.*

THE testing of *C. diphtheriae* for virulence has been carried out, until very recently, exclusively on experimental animals, though the need for a reliable *in vitro* test has long been recognized. Using the principle of toxin-antitoxin flocculation devised by Nicolle, *et al.*,[2] for titrating the L_f unit of toxin, Elek [1] has worked out an *in vitro* method which seems entirely reliable when certain conditions are strictly adhered to.

The test, as devised by Elek, consists of the preparation of an agar base which must be clear and contain 0.3 gm. maltose and 0.07 ml. lactic acid per 100 ml. To this melted, cooled base is added 20 per cent normal horse serum, and the mixture is poured into a Petri dish (100 x 10 mm). A sterile filter paper strip, 6 x 1.5 cm., is dipped into diphtheria antitoxin containing 1,000 u/ml. drained, and placed in the center of the dish and allowed to sink into the warm agar. After solidification, the plates are dried in the incubator and inoculated on the same day. Four organisms may be tested on each plate; a known virulent strain should be included.

In describing the test and the nature of the reaction Elek says [1]:

"If the organism to be tested is inoculated in the form of a wide line at right angles to the filter paper the toxin produced by the organism will diffuse out in descending concentrations, just as the antitoxin diffuses from the filter strip. In these circumstances the points of optimum proportions for toxin-antitoxin reaction fall on a continuous line, and the flocculation which occurs along this line provides striking graphic representation of the law of optimal ratios. On each side of the inoculum a white line develops at an angle, so that a toxicogenic strain becomes virtually marked with an arrow-head."

While endeavoring to confirm Elek's work by running a long series of virulent and avirulent cultures in comparison with tests in animals, sources of error were noted and are here described.

Preliminary Experiments with Materials

A. *Preparation of Agar Base*

The first lot of medium was prepared according to the original technique. It was soon found that a clearer agar solution was obtained by omitting both filtration through paper pulp and clarification with charcoal. Difco granulated agar was used and the base was prepared by dissolving and titrating all ingredients together. The base was tubed and divided into two parts. One half was sterilized in flowing steam for 30 minutes on 3 successive days as recommended by Elek. The other half was autoclaved at 15 lbs. for 15 minutes.

Preliminary experiments were made to determine the efficacy of autoclaving. Eight different virulent strains were used, and no significant difference could be noted between the two methods of sterilization.

* From The Laboratory Division

Preliminary experiments to determine the optimum pH indicated that the reaction took place in agar most readily between pH 7.6 and 8.2. More acidic or basic media inhibited the reaction of some strains.

While working with the base medium, several media commonly used in many laboratories were tried. Difco Heart Infusion Agar and Proteose No. 3 Agar were found to be unsatisfactory even with the addition of maltose and lactic acid in the recommended amounts.

As a result of the preliminary experiments preparation of the basal medium was modified for use in our work as follows:

Proteose peptone—Difco	20	gm.
Maltose Difco	3	gm.
Lactic acid C. P.	0.7	ml.
Agar, granulated Difco	15	gm.
Sodium chloride C. P.	5	gm.
Distilled water	1,000	ml.

Dissolve the ingredients in a boiling water bath and adjust to pH 7.8. Dispense in desired amounts by measuring fairly accurately. Autoclave at 15 lbs. for 15 minutes. Store in icebox.

B. *Antitoxin*

Different concentrations of antitoxin for the filter paper strips were tried. It was found that a dilution containing 500 u/ml. (units of diphtheria antitoxin per ml.) was as satisfactory as the 1,000 u/ml. originally recommended.

C. *Petri Dishes*

For use with the regular-sized Petri dish (100 x 10 mm.) filter paper strips were cut to measure 6 x 1.5 cm. and were sterilized by hot air. Agar base was dispensed in 10 ml. amounts, to which were added 2 ml. of serum. One filter strip was placed in the center of each dish, which could accommodate 4 tests.

When running large numbers of cultures it was found convenient to use Petri dishes measuring 150 x 15 mm. Filter paper strips were cut to measure 10 x 1.5 cm. For these dishes, agar base was tubed in 25 ml. amounts to which 5 ml. of serum were added. Two filter paper strips were placed in each dish, one on each side. This made it possible to make 14 tests per dish.

D. *Serum*

As horse serum is difficult to obtain in some laboratories it was thought advisable to compare sera from other animals and to substitute a more readily available serum if it proved to be satisfactory. Sera from horse, sheep, rabbit, and human beings were compared using 36 strains of *C. diphtheriae*. Rabbit serum was found to be as effective as horse serum. Sheep serum was also satisfactory, but human serum was definitely inferior. As rabbit serum was easily available, it was used throughout this study. Citrated and oxalated plasma were found to give no reactions whatsoever.

PERFORMANCE OF THE TEST

The present technique for preparing the plates is as follows:

Melt the agar base and cool to 50° C. Add 20 per cent sterile serum, mix, and pour into a sterile dish. While the agar is fluid, place the filter strips, which have previously been saturated with diphtheria antitoxin, (500 u/ml.) in the desired position and press into the agar. Allow the plate to harden with the cover partially removed to give a dry surface, and dry further in the incubator for several hours before streaking. For this study plates were inoculated the same day they were prepared. Inoculations are made with a loop approximately 3mm. in diameter. A loopful of broth culture (24–72 hours old) is streaked in a continuous line at right angles to the paper strip across it, and at least ½ to ¾ inch on both sides of it. Inoculum should be large enough to spread easily but not large enough to spread out of bounds.

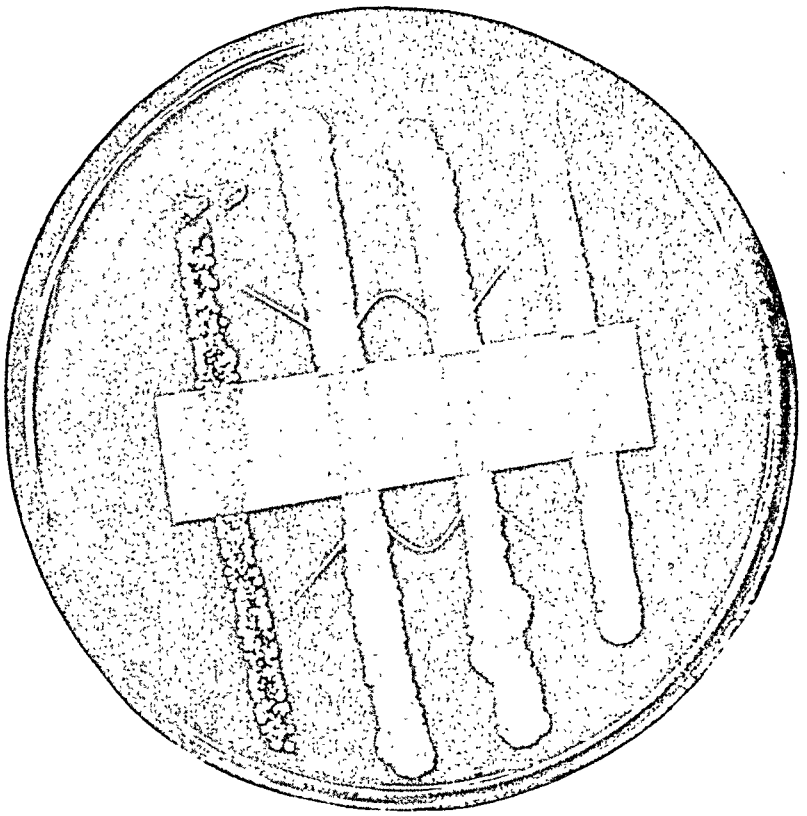

FIGURE 1—The *in vitro* virulence test in a 100 x 15 mm. plate observed after 72 hours at 37° C. For method of preparation see text. The two central cultures are virulent and each forms a "4s" reaction (four well marked oblique lines of precipitation). The two outer cultures are avirulent. The tips of the lines of precipitation between the two central streaks of growth have merged, forming arcs.

The surface of the agar should not be broken. Preliminary tests indicate that growth on slants may be used successfully and may even prove superior to broth inoculum for the *minimus*[3] cultures since these grow lightly in broth. The inoculated plates are incubated at 37° C.

Readings are made at 24, 48, and 72 hours. At 24 hours the lines of reaction between toxin and antitoxin may be very faint, and it is often necessary to search for them with a hand lens. A strong source of illumination is needed, and an ordinary gooseneck lamp with a 100 w. bulb, shaded, has been found to be satisfactory. Readings are made by viewing the unopened plate from the bottom while moving it from side to side. A little experience is needed to recognize early reactions, but strong reactions may be seen plainly without the lens and in any good light.

Extending outward from the growth of each virulent organism there appear two pairs of fine white lines of flocculation, one pair of lines on each side of the filter strip. The two lines of each pair project from each of the sides of the line of inoculation at angles of approximately 45° to the line of inoculation and away from the filter paper. Each pair of lines suggests the "arrow-head" which Elek mentions. The lines arise 6–8 mm. away from the filter paper. Early reactions are seen close to the growth of the organism and the lines increase in length

and intensity as the incubation time increases. These reactions are shown in Figure 1.

All four lines do not appear simultaneously, nor do they show the same intensity. It is therefore convenient, in reading the results of tests, to record the number of lines appearing, with a statement of intensities. For example, a reading of 1w,2s would indicate 1 weak and 2 strong flocculation lines, with the fourth line not appearing at the time the reading was made.

Strong reactions are those which may be seen without a hand lens. Weak reactions are seen only with difficulty without magnification.

A few avirulent organisms produced very indistinct lines and several produced an excessive number of lines at various abnormal angles to the line of inoculation. These developed later than 72 hours, usually only after 5 days at 37° C. These reactions, because of their diffuseness, or abnormal numbers, or late development, cause no confusion after their true nature was recognized.

RELATION OF *in vitro* VIRULENCE TEST TO TYPE OF *C. diphtheriae*

At the time this study was undertaken, large numbers of field cultures were being received from the Georgia State Board of Health. These were streaked on cystine-tellurite agar[4] for isolation. Pure cultures, morphologically positive or doubtful, were typed according to McLeod's[5] method of classification.

Virulence tests were run on rabbits with 48 or 72 hour broth cultures, and the same broth cultures were used to determine virulence by the *in vitro* method.

One hundred and forty-one cultures thus tested showed complete agreement between the rabbit and the *in vitro* virulence tests. A review of the strains tested showed that they fell into the following types:

Type	*Virulent*	*Avirulent*
Gravis	31	1
Gravis-like	13	0
Mitis	18	2
Mitis-like	38	7
Indeterminate	2	1
Diphtheroids	–	28
Totals	102	39

As no minimus strains had been isolated while this study was in progress, 24 virulent minimus strains, isolated earlier in the year, were taken from stock. At the same time a number of avirulent strains of various other types were selected for testing.

The *in vitro* reactions produced by the virulent minimus strains were generally of lesser intensity and were slower in appearance than those of mitis or gravis strains. Tests with minimus strains were also adversely affected by various factors which had little or no influence on the reactions of other strains.

For example, the first 24 minimus strains tested were included along with a series of 38 other virulent and avirulent strains. This series of test plates was inoculated from 72 hour broth cultures. The minimus reactions were weak or negative in 24 hours, but all of these strains gave strong readings in 48 hours. However, in another test in which these same 62 cultures were streaked on the test plates from solid medium, variable and unsatisfactory results were obtained.

RELATION OF SERUM TO *in vitro* VIRULENCE TEST

In seeking for an explanation of the unsatisfactory results it was noted that the rabbit serum used in preparing the agar for the tests showed considerable hemolysis. There were thus two new factors in this experiment: inoculation from slants of solid medium (Pai slants) and hemolysis in the rabbit serum. To determine which factor, if either, was

TABLE 1

responsible for the poor results, 7 strains (6 minimus and 1 mitis), each in both 48 hour broth cultures and on Pai slants, were used as inoculum. Rabbit serum was collected carefully so as to avoid hemolysis, and was separated from the clot as soon as possible. Hemolysed erythrocytes were prepared by washing 2 ml. of defibrinated rabbit blood with saline, then lysing 1.5 ml. of packed cells with 13.5 ml. of distilled water. Three tubes each containing 25 ml. of agar base were melted and cooled to 50° C. To each was added the following:

Tube	*Clear Serum*	*Distilled Water*	*Red Cell Solution*	*Resulting Medium*
1	5 ml.	1 ml	0	Clear
2	5 ml	0 7 ml.	0 3 ml.	Slightly hemolysis
3	5 ml.	0	1 ml	Marked hemolysis

Test plates, with paper strips and antitoxin, were prepared from these 3 tubes in the usual manner. Slant and broth cultures of each organism were streaked side by side on each of the three types of media. Results are as shown in Table 1.

In Table 1 it is clear that inoculations may be made from slants even more successfully in the case of minimus cultures than from broth. It is also clear that some substance was released from the erythrocytes when lysed that markedly inhibited the reactions, particularly those of the minimus strains.

To determine the extent to which the method of preparation of the serum affected the reaction two rabbits were bled and equal portions of their blood were pooled in three large tubes. The three tubes were treated as shown below.

Tube 1	(A) Centrifuged immediately and serum removed	Only slightest tinge of hemolysis
Tube 2	Placed in icebox overnight Next day;	
	(B) Centrifuged, 5 ml. serum removed.	Same degree of hemolysis as (A)
	(C) Clot and remaining serum stirred. Centrifuged and serum removed.	Slightly more hemolysis than (B)
Tube 3	Placed in icebox for 48 hours	
	(D) Centrifuged and serum removed	Same degree of hemolysis as (A)
	(E) Clot and remaining serum mixed Centrifuged and serum removed	More hemolysis than (C) but still very slight

The results obtained with these sera in the *in vitro* test are shown in Table 2. The results obtained with both types of inoculum were essentially the same.

TABLE 2

Effect of Method of Preparing Serum on the in vitro Virulence Test

Culture Number	Type of Culture	Tube 1 (A) 24 hrs.	Tube 1 (A) 48 hrs.	Tube 2 (B) 24	Tube 2 (B) 48	Tube 2 (C) 24	Tube 2 (C) 48	Tube 3 (D) 24	Tube 3 (D) 48	Tube 3 (E) 24	Tube 3 (E) 48
A-391	Min.	2w	4s	..	4s	..	2w	..	..	..	..
A-366a	Min.	4w	4s	2w	4s	..	4w	..	..	..	..
A-389	Min.	4w	4s	..	4s	..	3w	..	..	..	..
A-1307a	Mitis-like	3s, 1w	4s	4s	4s	2s, 2w	4s	4s	4s	4s	4s

This experiment indicated that prolonged contact of serum with the clot materially affects the value of the medium for virulence tests with minimus strains.

This reduction in reactivity seemed out of proportion to the amount of hemoglobin released by the red cells. As potassium is also released in comparatively large amounts during hemolysis, graded concentrations of KCl up to 2 mg. per cent were added to tubes of basal medium. When used for *in vitro* virulence tests, the presence of the KCl did not cause any inhibition of the reactions. As small amounts of iron are known to inhibit toxin production, it is suggested that iron may be responsible for the unsatisfactory results in media containing much free hemoglobin.

The following method for collection of serum has been found to give consistently large yields of serum free of hemolysis:

Withdraw, aseptically, 50 ml. of blood from the heart of a rabbit; with as little force as possible place the blood in a sterile Petri dish 150 x 15 mm. in size. Allow this to stand for several hours then remove the exuded serum with a pipette. Do not break or in other ways disturb the clot. Centrifuge the serum twice to make sure that all erythrocytes have been removed.

The usual method of placing the blood in a test tube and loosening the clot before centrifugation has been found to be unreliable as some lysis occurs when the clot is disturbed in any way.

PRACTICAL APPLICATION OF THE *in vitro* VIRULENCE TEST

Using the previously noted modifications of the original test, and using, in the cases of minimus cultures, serum previously tested for reactivity with minimus strains, a total of 290 cultures were tested for virulence by the *in vitro* and *in vivo* methods during this study. Some of these tests were made during the experiments referred to above. There was complete agreement between the two methods. The data are shown in Table 3.

TABLE 3

DISCUSSION

Assuming an effective agar base is used, and such obvious factors as pH, type of inoculum, and amount of anti-

toxin are properly adjusted, it seems evident that the most important other factor in assuring correct results by the *in vitro* virulence test for *C. diphtheriae* is the collection and preparation of the serum used in the agar base. Since many lots of serum are not satisfactory even though they show only very slight hemolysis, it is important to test each different lot for reactivity especially *with minimus strains*. Most specimens of serum will be satisfactory for the majority of other strains of *C. diphtheriae*. This is shown by the fact that in the first long series of tests, when no minimus strains were encountered, complete agreement was obtained with the animal test although no special precautions were observed in the collection of the serum.

SUMMARY

The study of the *in vitro* virulence test described in this paper has led to the following observations concerning it:

1. In preparing the medium it was found satisfactory to:
   a. Use purified Difco agar in a simplified formula which omits clarification.
   b. Sterilize by autoclave.
   c. Use diphtheria antitoxin in concentrations of 500 u/ml.
2. The optimum pH range for the reaction was found to lie between pH 7.6 and 8.2.
3. Difco Heart Infusion Agar and Proteose No. 3 Agar with maltose and lactic acid added are unsatisfactory basal media.
4. Rabbit and sheep sera were shown to be as satisfactory as horse serum. Human serum seemed to be less satisfactory than the others.
5. The reaction of minimus strains is inhibited by using serum faintly colored by lysis of erythrocytes. Other strains are less affected by this factor.
6. Some unknown substance or condition, which interferes with the *in vitro* virulence test, appears in the serum when it remains in contact with the clot for one day or longer. This may cause a high percentage of falsely negative reactions, particularly in testing minimus strains.
7. In a series of tests, including 167 virulent and 123 avirulent strains of all types, complete agreement was obtained between the *in vivo* and *in vitro* tests when the technique described in this paper was followed.
8. A positive reaction in the *in vitro* virulence test seems to be an entirely reliable indication of virulence of *C. diphtheriae*.
9. A negative reaction in the *in vitro* virulence test may be given by some virulent strains unless conditions favorable to a positive reaction by those strains be provided. In the present state of our knowledge, conditions favorable for a positive reaction by all virulent strains cannot be stated with certainty. Therefore, any negative reaction to the *in vitro* virulence test should be verified by animal inoculation.
10. The test deserves further study.

Effect of Ultra-Violet Irradiation of Classrooms on Spread of Mumps and Chickenpox in Large Rural Central Schools*

Progress Report

ANNE M. BAHLKE, M.D., F.A.P.H.A., HILDA FREEMAN SILVERMAN, AND HOLLIS S. INGRAHAM, M.D., F.A.P.H.A.

New York State Department of Health, Albany, N. Y.

THE purpose and general plan of this study have already been described in detail in a preliminary report dealing with the experience in the measles epidemic of 1945–1946.[1] It is not necessary, therefore, to present these details at this time. Suffice it to say that the same three schools have been kept under observation, the same care in regular cleaning and checking of the germicidal lamps has been maintained, and the same methods of compiling the epidemiological data have been used throughout.

The Cato-Meridian School is still fully equipped with ultra-violet lights. In Port Byron, all places of common congregation and the classrooms housing one section of each grade through the 8th are still irradiated, while the classrooms with other sections of the corresponding grades have no ultra-violet lamps and thus serve as controls. The Mexico School, with no ultra-violet lamps, still serves as a wholly unirradiated control school.

Two minor technical improvements that were made early in the school year of 1946–1947 are worthy of note. A fixture design was developed which made irradiation of the gymnasia feasible, and the reflectors in the deep-trough corridor fixtures were modified so as to insure a level of radiant energy in the corridors equivalent to that in the classrooms. During the measles epidemic, the gymnasia had not been irradiated and the corridor fixtures were somewhat less efficient than those in the classrooms. Otherwise, the procedure as originally described has been followed consistently in every respect.

Measles was epidemic in all three schools during the same school year. Such epidemiological good fortune has not occurred with the diseases presently under discussion, but sizeable outbreaks of both mumps and chickenpox have occurred in the partially irradiated school at Port Byron. Likewise, mumps and chickenpox have each been epidemic once in fully irradiated Cato-Meridian, and two outbreaks of chickenpox have occurred two years apart in the wholly unirradiated control school at Mexico. With full cognizance of the limitations and pitfalls of epidemiological data not compiled at the same point in time, it seems worth while to present some of the salient features of these epidemics.

* Presented before the Epidemiology Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 10, 1948.

RESULTS

Mumps

The epidemic of mumps occurred in Port Byron in the school year of 1946–1947. In the Cato-Meridian district, it was a year later, in 1947–1948.

The outbreak in Port Byron began in the older pupils, with the first cases in the early winter among members of the basketball team; spread to the lower grades occurred through a younger sibling of one of the team. When the episode was over, 267 cases had been recognized in an enrollment of 863, with 240 among 715 pupils in the kindergarten and first 8 grades.

Since ultra-violet lamps were installed only in the lower grade rooms through the 8th, detailed analyses have been restricted to these grades. With only 27 cases, 11 per cent of the total, occurring in high school pupils, this restriction does not seriously limit the validity of the data. The findings for the lower grades are summarized in Table 1.

Because of the relatively small numbers of susceptibles and cases in each classroom, the percentages for the individual classes are unstable and widely variable. The total figures, however, are large enough to permit a comparison.

It is not known when the last prior epidemic of mumps occurred in the Port Byron area, but it was far enough in the past for the susceptibility in the lower school to have reached 75 per cent in unirradiated pupils and 72 per cent in the irradiated group. The attack rates are also strikingly similar, 49 per cent in the unirradiated controls and 46 per cent in irradiated pupils.

In Port Byron, the mumps infection started in December; the peak was passed by mid-April, and by the end of May, the epidemic had burned itself out. Such was not the case in Cato-Meridian. There the disease did not appear until May and was still occurring with considerable frequency at the close of school in the third week of June. Accordingly, arrangements were made for the school nurse to canvass the school population for all cases of mumps that had onset within 26 days of the last known school exposure. Sixteen such cases were found and these have been included as an integral part of the epidemic. In all, 66 cases were recognized

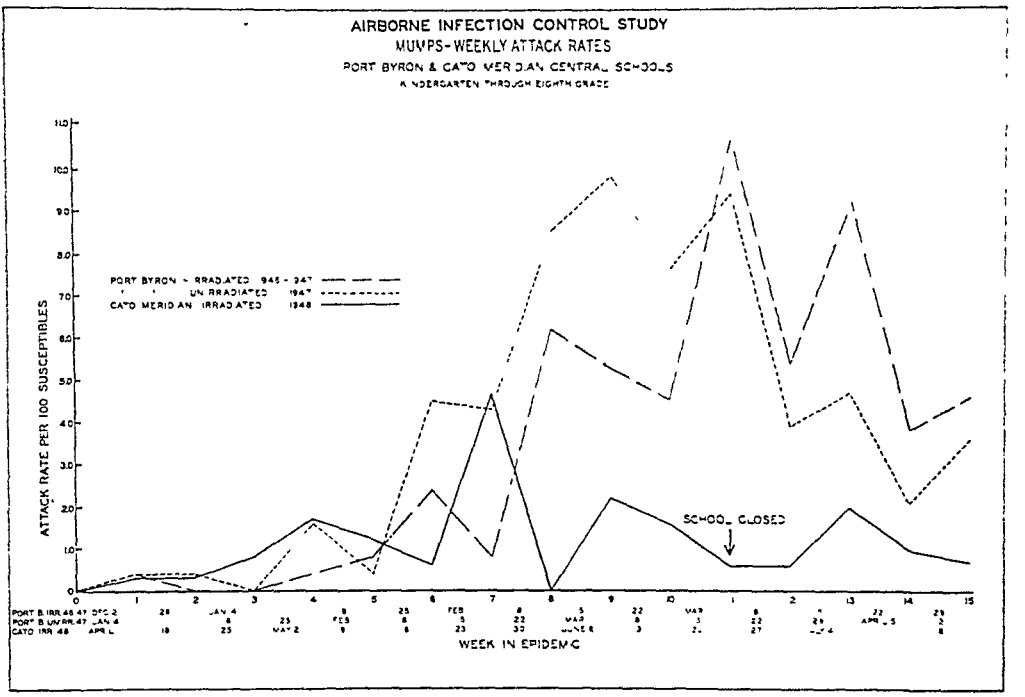
‡ As of start of epidemic in each grade Children who entered while epidemic was in progress are classified according to their status at time of entrance.

The total susceptibility rate in Cato-Meridian was 69 per cent, only 3 per cent lower than that in the irradiated group at Port Byron. Yet many less cases per 100 susceptible children occurred for the comparable grades in Cato-Meridian, and the total attack rate was only 17 per cent.



Past experience in the New York State Department of Health indicates that mumps is likely to be equally prevalent in the winter and spring months, but a definite decrease in incidence does occur with summer weather. The warm months intervened early in the Cato-Meridian outbreak and when it had been in progress for only two months, the school closed for the year. Thus, two factors may have been operative to interfere with the course of the epidemic and shorten it.

In an attempt to correct for this shortening to some extent, the full duration of the epidemic in the Cato-Meridian School has been compared with a corresponding period at the beginning of the epidemic in Port Byron, 15 weeks in all. The results of this comparison in terms of attack rates on a weekly basis are shown in Chart 1. For the most part, these rates are very different in the two schools, but the calendar months corresponding to the epidemic weeks are different also, so that the week of February 15 in Port Byron, which was marked by an increase in incidence in irradiated pupils, corresponds to June 6 in Cato-Meridian. This seasonal factor alone might account for the difference.

During the summer of 1944, mumps appeared in the Mexico district and the subsequent outbreak resulted in approximately 235 cases in the first 8 grades. Inasmuch as the school was not enrolled in this study until January, 1945, at which time over 100 cases had occurred, no attempt was made to study that outbreak. Since that time, mumps has not been epidemic in the Mexico School population.

During the mumps outbreak in Port Byron, as during the measles in the preceding year, an attempt was made to evaluate the importance of the school buses in the spread of infection through the school population. The air in the

CHART 1

buses was not subjected to a bactericidal agent. Moreover, most of the cases occurred during cold weather when the bus windows were kept closed, so that natural ventilation was at a minimum. Consequently, it might be expected that if ultra-violet radiation has any effect on the spread of mumps, children from irradiated classrooms who did not ride the school buses would have a lower attack rate than those who did ride. Such a differential was observed in the measles outbreak.

The results of an analysis along these lines are shown in Table 3. The numerical distribution of susceptibles in the four groups—riders and non-riders in unirradiated classrooms as compared to those in irradiated rooms—is not widely varied, and here again the attack rates are remarkably similar. Forty-nine per cent of susceptible bus riders from unirradiated classrooms were attacked, the same rate as for susceptible non-riders from the same environment. The rate for riders from irradiated classrooms was 45 per cent, and that for non-riders from the same environment, 51 per cent. Such findings offer no evidence that the buses facilitate the spread of mumps through the school. It should be noted, however, that the non-riders live in the village and so have a greater opportunity than the riders for extra-school exposure. This would tend to elevate the rates in the non-riding population.

TABLE 3

MUMPS

Port Byron School, 1946–1947

Attack Rates Among Susceptible Bus Riders and Non-riders, Kindergarten Through Eighth Grade

Riders and Non-Riders	*Unirradiated Classrooms*	*Irradiated Classrooms*
Susceptible bus riders	194	210
Susceptible non-riders	57	45
Cases in bus riders	95	94
Cases in non-riders	28	23
Cases per 100 susceptibles:		
in bus riders	49.0	44.8
in non-riders	49.1	51.1

Because all pupils in the Cato-Meridian School regularly ride the buses, an attempt to evaluate their importance in the spread of the mumps virus in that school is not possible with the type of analysis made above.

Chickenpox

Since the beginning of the experiment in January, 1945, four epidemics of chickenpox have occurred in the three schools under observation, one each in Port Byron and Cato-Meridian, and two in Mexico.

The major experience was in Port Byron during 1947–1948, when 109 cases occurred. The enrollment for the whole school was 890, but all of the cases were in 720 pupils in the kindergarten and first 8 grades. These findings are summarized in Table 4. Susceptibility ratios for unirradiated and irradiated pupils are essentially equal, being 36 per cent for the unirradiated and 41

per cent for irradiated individuals. Likewise, no practical differences occurred in the proportions of susceptible pupils attacked in the two groups. Thirty-six per cent of 128 unirradiated susceptibles contracted chickenpox as compared to 45 per cent of 139 in irradiated classrooms.

The first epidemic in Mexico occurred in 1945–1946, and the second one two years later in 1947–1948. The earlier episode resulted in 75 cases in a total enrollment of 938, with 69 of them among 548 pupils in the first 6 grades. Detailed analyses were not attempted beyond the 6th grade at this time because the susceptibility histories in the higher grades were deemed unreliable. The detailed findings are presented in Table 5. Table 6 summarizes the later episode in which 74 cases occurred in a total enrollment of 926, with 67 among

550 pupils in the first 6 grades, or 70 among 691 in the first 8 grades.

The total susceptibility rates of 36 per cent and 34 per cent respectively in these two epidemics are remarkably alike, and when they are considered in relation to the rate of 36 per cent in unirradiated pupils in Port Byron (Table 4), the comparability is striking. Similarly, the attack rates in the two outbreaks in the wholly unirradiated Mexico School, 38 and 39 per cent respectively, are very close to the rate for the control group in Port Byron.

The epidemic in the Cato-Meridian School occurred in 1946–1947 and consisted of 54 cases in a student body of 709, with all of them among 529 pupils in the first 8 grades. The data are shown in detail in Table 7. Here again the susceptibility rate of 38 per cent is almost identical with the rate of 41 per cent observed in the irradiated group in Port Byron (Table 4). The attack rates, by contrast, are appreciably different, 28 per cent in Cato-Meridian and 45 per cent in Port Byron. This difference reaches the 3 sigma level of significance, but the possible importance of significantly different rates in these two irradiated groups diminishes when it is noted that neither of these rates is significantly different from those in any of the three epidemics in the unirradiated control group.

Table 8 shows the results obtained when the data are analyzed with regard to the bus-riding status of the pupils involved. The attack rates at Port Byron for susceptible bus riders according to whether they were in unirradiated or irradiated classrooms were 39 per cent for unirradiated riders and 47 per cent for those irradiated. Attack rates for non-riders are 27 per cent in the unirradiated and 35 per cent in the irradiated group, non-riders lower in both instances, but these differences are *not* significant.

In the two outbreaks in the unirradiated school at Mexico, also shown in Table 8, 41 per cent of riders as compared to 30 per cent of non-riders were attacked in 1945–1946, and 37 per cent of riders and 43 per cent of non-riders in 1947–1948. Again the differences are not significant.

There is no evidence here that the school buses facilitate the spread of the chickenpox virus through the school population. The figures conflict with those obtained during the measles epidemic when irradiated non-riders had a significantly lower rate. It is difficult to explain the discrepancy by attributing it to possible differences in the behavior of the chickenpox and measles viruses in the various situations tested. The reason, then, for the time being at least, must be said to remain obscure.

CHRONOLOGICAL PATTERNS

During the measles epidemic previously described, interesting differences in the chronological distribution of the cases in the specific outbreaks in the individual schools were noted, a low-grade, protracted type of spread occurring in the irradiated environments, and appreciably more explosive episodes in the unirradiated control areas.

With these differences in mind, the several epidemics that have been discussed were examined for similar manifestations. The picture for mumps in Port Byron offers no evidence that the epidemic was more explosive in the unirradiated than in the irradiated group. This can be defined arithmetically, as it was for the measles epidemic, in terms of the range in days of the onsets of the middle 80 per cent of cases. Among unirradiated pupils with mumps in the kindergarten and first 8 grades, this was 53 days. For irradiated pupils, all in corresponding grades, it was 54 days.

In Cato-Meridian, again, lack of explosiveness is evident, and the range in days for the middle 80 per cent of cases is 64, only 10 days longer than in Port Byron.

With chickenpox, the story is somewhat different. In Chart 2, from the chickenpox epidemic in Port Byron, again a low-grade endemic type of spread is evident among irradiated pupils. Among the unirradiated by contrast, there is a definite suggestion of accumulation of infection, in clean-cut waves demarcated roughly by the incubation period of the disease. Moreover, the middle 80 per cent of cases in the unirradiated group occurred in 49 days, whereas in the irradiated group, the span is 78 days.

In wholly irradiated Cato-Meridian, the picture is essentially that of the irradiated group in Port Byron. And the time range of the middle 80 per cent of the epidemic was 76 days, almost identical with the 78 observed in Port Byron.

Here, then, is a tangible difference in pattern which could be related to the nature of the environment, and perhaps specifically to the presence or absence of ultra-violet radiation. Some possible doubt of this assumption is suggested by the fact that the picture of the recent epidemic in the unirradiated Mexico School in 1947–1948 is a reproduction of that obtained in the unirradiated classrooms in Port Byron, but the epidemic at Mexico in 1945–1946 is just as good a duplication of the patterns from the irradiated groups in Port Byron and Cato-Meridian. In terms of time spanned by the middle 80 per cent of the cases, the contrast is just as striking, since in the more recent epidemic this comes to only 44 days, and in the earlier episode, it was 108 days.

Another difference in these two epidemics was the year of their occurrence, of course, but it hardly seems that any seasonal factor could have been operating, since the first case occurred on November 24 in the earlier episode and on December 5 in the later; and both outbreaks were well underway in the cold months. It will be recalled that the enrollments were essentially the same in the two years also, and that the susceptibility and attack rates were extraordinarily similar. The reason underlying

TABLE 9

MUMPS AND CHICKENPOX

Port Byron, Cato-Meridian and Mexico Schools

Range in Days of Middle Eighty Per cent of Cases

Mumps:		
Unirradiated	Port Byron	
	Whole School	71 days

Irradiated	Port Byron	78 days
	Cato-Meridian	76 days

this interesting observation, therefore, is not clear.

Table 9 shows a summary of the range in days of the middle 80 per cent of cases in all of the epidemics that have been discussed.

CONCLUSIONS

These analyses of epidemics of mumps in two of the centralized schools under study offer no incontrovertible evidence that ultra-violet lamps in the classrooms modified the spread of the disease in those classrooms. This finding may indicate that ultra-violet irradiation is ineffective in controlling the spread of mumps, or it may mean merely, as some authorities believe, that mumps is not an air-borne infection.

On the other hand, the differences in the rate of spread of chickenpox, with low-grade protracted epidemics in irradiated individuals and more explosive episodes in unirradiated controls, may be due to the presence of the ultra-violet radiation. A similar interpretation was suggested in the prior report dealing with measles. The observation of the two extremes for no demonstrable reason in the wholly unirradiated control environment does not invalidate the above premise, but it does emphasize the fact that an endemic type of spread may be due to other inapparent causes. And, above all things, it points to the extreme variability of disease patterns and the need for study of several epidemics of each disease in each environment before any definite conclusions are justified.

One consistent finding in all of the outbreaks observed thus far merits emphasis: the shorter, sharper type of outbreak has never been encountered in an irradiated environment. This may be an effect of the ultra-violet radiation in the atmosphere.

The findings presented suggest that failure to observe protection against mumps and chickenpox among pupils in unirradiated classrooms as compared to those in irradiated rooms cannot be explained on the basis of exposure within the buses. It is possible that the significance of the buses may be better evaluated, however, when further data have been compiled with the air in them under treatment with bactericidal vapors. The Port Byron buses are now equipped with vaporizers which dispense triethylene glycol whenever the bus is in operation.

Also, as of the current year, observations in another school in the same area have been started. The entire school building and the buses are equipped with triethylene glycol vaporizers instead of ultra-violet lamps, but the same methods of study are being used as have been used throughout in the ultra-violet experiment.

While the main purpose of the experiment as presently conducted has been to test the possibility of controlling the spread of measles, mumps, and chickenpox in rural centralized schools by ultra-violet irradiation of classrooms, the opportunity for obtaining data on absence due to nonspecific respiratory diseases has not been overlooked. It is hoped to report these data at some time in the future.

In closing, the authors would like to remind their readers that this study has not been conducted with the idea that it is desirable to prevent the spread of measles, mumps, or chickenpox in school children. These diseases were selected merely as good workable criteria to test the effectiveness of ultra-violet irradiation of classrooms in controlling the spread of air-borne infection in centralized rural schools.

ACKNOWLEDGMENTS — The continued excellent coöperation of the entire school personnel of all three schools and the assistance and substantial support of Dr. L. J. Buttolph and the General Electric Company are gratefully acknowledged.

Classifying Health Agency Positions

NORMAN LOCKE, PH.D.

Personnel Representative, Federal Security Agency, Region II, New York, N. Y.

THE daily activities of a health department relate to many and varied functions. Most of these are program activities — communicable disease control, maternal and child health, nursing functions, laboratory work, and so on. Some activities are administrative — business management, fiscal operations, personnel administration, and such. Even within the several administrative areas, certain further divisions can be made. Thus, one sector of personnel administration is position classification, a subject of increasing interest to officials in public health.

Position classification, in its simplest terms, consists of the orderly arrangement by duties and responsibilities of the position of an agency. This arrangement of positions is called the classification plan, a plan that can be put to many administrative uses and can be of considerable value to the health officer. For example, the pay plan, or the proper salary level of all classes of positions, can be determined by referring to the duties and responsibilities of each class of position. Employee selection can be simplified by the plan, for a given set of duties and responsibilities carries with it a statement of the minimum requirements of training and experience required for the successful completion of those duties. The classification plan reveals the ladders of promotion from one position to the other merely by scanning the hierarchy of duties in the plan. Programs of employee training and orientation may be based on the responsibilities of positions in the plan, and directed toward the development of the skills demanded by those responsibilities. Likewise, the employee service rating or efficiency rating program becomes considerably clarified by keeping in mind the requirements of the position in which the employee is being rated. The classification plan has been found to be of help in simplifying the budget process, by supplying the administrator with a common title for common positions. Further, an organizational use has grown out of position classification, the process of placing duties and responsibilities having been found to reveal weakness or faults in the organizational structure.

The classification survey, although involving technical detail, is not solely a matter of technique, for a certain amount of basic administrative planning must also be undertaken. Among these is the decision as to who shall conduct the survey—staff members of the health agency, a private firm of management consultants, or perhaps occasional consultation from some recognized person in the field. Administrative implications of the effect of a survey on staff members, the amount of time the survey will consume, how many positions can be classified in a given period, and similar questions call for planning. Questions of policy will arise with respect to the action to be taken when employees are found to be working in titles different from those for which they were hired, or that to be taken with respect to salary changes, as well as policy with respect to the fiscal implications of classification.

Before undertaking a survey, no mat-

ter by whom performed, it is essential that every member of the staff understand the purpose and procedures of position classification. Since position classification seems essentially a simple process, it may bring with it a feeling on the part of the administrator that he could do the whole job himself if he had a little time, or perhaps a feeling of astonishment that classification should take as long as it does. Staff members may resent the activity or fear it. Misapprehensions with respect to classification are many, and all too often the end product of a classification survey is a period of turmoil in the agency or a flat rejection of the entire plan. It is strongly recommended that a classification study be delayed, or even not initiated, until the staff perceives the need for position classification and the uses of the classification plan.

A valuable means of assuring understanding is the formation of a committee to recommend policy, to administer and coördinate the survey, to concern itself with the technical aspects of job analysis, and to hear appeals. Other methods will suggest themselves to the administrator, but no matter what the technique for insuring participation, it is strongly recommended also that no classification project be undertaken until a reasonable degree of acceptance on the part of employee and supervisor has been achieved.

The basic process of classifying positions, like that of classifying anything else, calls for the data to be classified, a set of standards regarding the classes into which to place the data, and judgment in deciding which datum goes in which class. This is true whether one classifies the several kinds of pneumococci or personality types or positions. The material of position classification has been stated to be based on the duties and responsibilities of each of the positions to be studied. There are two standard ways of gathering this material: by questionnaire and by interview. In the questionnaire method, the employee holding the position being surveyed lists his duties and the responsibilities which he carries out in his work. He may do this by entering a notation of his functions as he recalls them at the end of the day or, preferably, he may record his activities at regular intervals throughout the day. An ideal means of obtaining a stable picture of work distribution is to have the employee keep a diary of his work over a period of a week, say, and summarize it for the questionnaire. In the interview, also known as a "desk audit" in the classification jargon, information is developed by speaking with the employee and having him identify his duties. As the employee enumerates his duties, he can be questioned with respect to known classification standards. As a result of this question and answer period, which can run from about 10 to 30 minutes on the average, one becomes aware of what each employee does, the extent to which he does it, and the organizational level at which the work is performed.

The advantage of using questionnaires in gathering job information is that of speed. Further, large numbers of employees can complete the questionnaire on the same day, yielding a picture of the distribution of duties and responsibilities as of a given time. If this method is used, care must be taken to insure that employees list job information in a manner that can be most useful. Instruction sheets should accompany the questionnaire, and it is most desirable to have a training period precede the survey.

The interview method has several advantages, not the least of which is that the interviewer can be more assured of the information which he is collecting. He can continue asking key questions until every phase of the position is known to him. Further, idiosyncrasies of agency language—the use of office terms,

form numbers, professional vocabulary, and the like—can be clarified immediately. Probably the greatest disadvantage of the method is the amount of time consumed in conducting interviews.

The use of the questionnaire, supplemented by interviews in instances in which the completed questionnaire is not clear or in which further information is needed, has been found to be a successful means of developing needed data.

Regardless of which method is followed, the position should be described in simple, objective terms. To the question "What are your duties?" a clear, unambiguous reply is desired. The answer "I assist the director" or "I have responsibility for dental care" is poor. What the employee *does* when he assists, or what specific *acts* make up the responsibility will determine the level of classification. Without this basic information the classification process cannot proceed.

Words which often are used and which are signals that the job description could be improved are "handle," "review," "pass upon," "assist," "examine," "prepare," and the like. When these are read or heard, it is well to stop for supplementary information. To cite an example from a function common to all health specialties, an employee may state that one of his duties is "to obtain from bureau directors a statement of their budget estimates and justifications," which tells us something of the job. A second employee then may state "I assist in obtaining from bureau directors a statement of their budget estimates and justifications," which tells us little. What is the nature of this assistance? Does it consist of taking over the budget meetings on certain days of the week or ordering pencil and paper or arranging the chairs prior to the meetings or just what? On further inquiry we may learn that what the second employee does is to compile and integrate budget requests prior to his supervisor's meeting with bureau directors, and we are then in a better position to evaluate the job.

After the data are collected, another major portion of the process of classification begins. The duties statements are read to determine the content and requirements of the position and the occupational area in which they will fall. Positions are then grouped by the profession, skill, or activity, by which they are generally recognized. That is, as medical, dental, nursing, engineering, laboratory, clerical, stenographic, custodial positions, and so on. Some of these groupings are easily arrived at, such as the position whose duties require the full-time operation of a typewriter or office machine. Others are more difficult to determine because the duties may straddle two or more occupational groups. When the positions have been grouped in this manner, they are then further examined to find the level in which they fall. This is achieved by grading the positions on the basis of the extent to which the duties and responsibilities become increasingly heavy.

The question, Why is one position considered to be at a higher level than another? seems to be one of interest to health officers. The factors that determine the level of a position are such basic ones as the training and experience needed, the decisions to be made, the variety of work, the extent to which the employee's authority is final, the establishment or interpretation of policy or procedure, the extent to which the work requires that the employee meet the public, the nature of the supervision which the employee receives, the type of supervision of others which the work entails, review of the work of others, and so on. Each of these factors is in turn composed of many degrees. Review of the work of others, for example, includes the purpose of the review, the authority to make changes, the scope of

the review. Going down to a still smaller unit, the purpose of the review can be for the propriety of the conclusions reached, for accuracy of the work, for the completeness of the work, for verification, or for coördination.

One of the end-products of a classification survey should be a set of class specifications describing the several classes of positions in the agency. The class specification includes a class title, an overall statement of the duties of the class, examples of the duties of the class, and the minimum requirements of education, experience, knowledge, and ability deemed necessary for the successful performance of the duties of the class. Thus, the title could be "Director, Division of Industrial Hygiene," the general statement of duties, "Under general direction, to administer a program for the control and prevention of occupational diseases and health hazards in industrial concerns," the example of duties, "Direct surveys of health hazards in industrial plans including the quantitative atmospheric determinations of dusts, gases, volatile solvents, toxic metals, and related hazards," and so on in a complete description of the duties of this director. The minimum qualifications would be the least amount of training and experience deemed necessary for successful performance of the duties.

As a tool, there is no doubt that position classification can be of great value to the health officer. Given a working knowledge of position classification, the administrator should immediately find that certain personnel problems are reduced, that problems of organization become clarified, and that certain simplifications in budgeting become possible. The procedure is not a panacea, but it does have its uses. Health agencies not having a plan of position classification could well consider establishing one. Health agencies which do have a classification plan could well examine the plan to determine if it is of most use to them.

The Health Officer and the Medical Profession*

ROBERT H. RILEY, M.D., DR.P.H., F.A.P.H.A.
Director, Maryland State Department of Health, Baltimore, Md.

NO health department can operate successfully unless it has the full confidence and support of the physicians practising in the area it serves. No health officer can long continue in his position against the opposition of a few influential members of the medical profession. No new program can successfully be launched without the consent and approval of the medical profession. These facts are of course axiomatic to all experienced health officers, but it is perhaps well to restate them and to call attention to certain fundamental principles which underlie the successful establishment and maintenance of proper relationships between physicians and the health department.

In this work a first and absolutely indispensable condition is that the health officer be, in fact and in feeling, a member of the medical profession of the area. He should be fully qualified to practise medicine and a member in good standing of the local, state, and national medical organizations. His membership should be something more than nominal. He should be a regular attendant at the meetings of his local society and should attend the state and national meetings as often as opportunity permits. When appointed to a committee of a medical organization he should use every effort to make its work a success. Not many members of local medical societies are willing to expend any great amount of energy in its work, and those who are willing to serve may thus exert a deciding influence on both the opinion and the action of the profession. In Maryland it has long been the custom for the county medical society to elect the health officer as its secretary. The fact that he has a fully organized office and is accessible at all times makes this a logical and convenient arrangement. On the other hand, the health officer who serves as secretary of his county medical society has opportunity to participate in the formulation of its plans and policies while they are still in their beginnings, and before the opinions of the members have had opportunity to crystallize. Policies and procedures always go through a period of fluidity during which it is possible to correct mistakes and to fill omissions without the generation of any emotional reaction. Once they have taken shape, however, those responsible for their formulation have an instinctive desire to protect their handiwork, and even small changes, the need for which seems to be obvious, can be made only with extreme difficulty. The health officer should always attempt to work from within the organization and should avoid, as if it were a plague, participation in any movement from without.

A second essential to success in dealing with the medical profession is to create in the minds of its members the

* Presented before the Southern Branch, American Public Health Association, April 14–16, 1949.

belief that the health officer deals with them frankly, honestly, and in good faith. This impression can be fostered only by action, never by words. The health officer who is proud to be a doctor, who is jealous of the good name of his profession, who is honestly anxious to be of service to the practitioners of his area, will soon implant in their minds that feeling of confidence and affection which is a necessary prelude to effective joint action.

A third essential is that the health officer observe medical ethics in spirit and in letter. Our present code of medical ethics represents the accumulated experience of many centuries. The reasons for some of its provisions are not at once evident, but that they still remain part of the code is testimony to the fact that they have real survival value.

A fourth essential is the careful observance by the health officer of those simple but vastly important habits which we speak of as "good manners." Good manners are of two kinds—those personal instincts which lead us to treat those with whom we deal with courtesy and consideration, and those administrative habits which involve the same principles of courtesy and consideration in our official dealings with those with whom our work brings us into contact. Administrative good manners are far more rare than personal good manners, perhaps because many physicians have only limited experience in administrative relationships. They become increasingly necessary as the organizations with which we have to deal grow larger and more complicated. They are well worth the careful study of every health administrator.

The health officer in his dealings with the medical profession should always remember that the most priceless possession of any physician is the confidence of his patients. The physician carries a heavy responsibility to those he serves, and he cannot properly serve them unless they believe not only in his personal qualities but also in his professional knowledge and skill. A doctor cannot therefore let himself be put in the position of being ignorant of any fact he might be supposed to know. Any new activity of the health department should therefore be made known to every practising physician before it is communicated to the general public. Nothing is more embarrassing to a physician than to be asked a question about some public health procedure to which he does not know the answer. His instinctive reaction is of course to advise against the procedure or to postpone reply until he has had an opportunity to become familiar with the facts. Then, too, a physician asked to carry out some technique with which he has not had previous experience may be expected to question the value of the procedure which he cannot perform without embarrassing awkwardness. The health department should therefore never ask the members of the medical profession to do anything new without first giving them opportunity to learn the actual technique well enough to carry it out with credit. It should never advocate any procedure regarding which it has not previously informed the medical profession. No representative of the health department should under any circumstances, except those in which criminal action becomes necessary, criticise a physician or cast doubt on his professional attainments. The regulation of medical practice has fortunately not been committed in most states to the health department, and the health officer must assume that any licensed physician is qualified to practise medicine. Nothing can destroy the confidence of the medical profession in the health department or create so deep and permanent an antagonism as does the criticism of practising physicians. A thoughtless word or even a critical intonation will

almost certainly be reported at once to its object and will breed a resentment out of all proportion to its apparent importance.

If he wishes successfully to bring the medical profession of his area to a new point of view, the health officer should foresee as far in advance as possible the new programs which are to be developed, and should suggest to the profession as often as possible that these policies are some day going to be put into effect. It is hard to be antagonistic to something which we have repeatedly been told is inevitable. The tendency of the medical profession is, in general, to be conservative and to oppose change, and this tendency can best be combated by suggestions extending over an appreciable period of time.

The opinion and the official action of almost any group of physicians is strongly influenced by two quite different groups of members. There are in every medical society of any size a few men who are frankly "on the make," who judge every new proposal from the standpoint of its effect on their own personal incomes. These men are frequently intelligent and resourceful and are almost always highly vocal and exceedingly active. At the other extreme, we always find a few men of high character and real devotion who are not always either vocal or skilled in political maneuvers. In the long run, however, it is character which finally prevails, and it is with the men of character and devotion that the health officer must align himself.

Doctors are after all only fallible human beings. It would be easier and nicer if they were created of a fibre a little finer than that of the ordinary man and were always inspired by the ideals to which only the best of men can attain. That they succeed in meeting as well as they do the tremendous responsibilities they must assume is no small testimony to the influence of the ideals and aspirations of the profession. A health officer who is proud to be a member of the medical profession and determined to uphold its highest ideals, who genuinely tries to understand the complicated problems of practitioners of medicine and to be conscious of their difficulties, will seldom fail to exercise great influence on their thinking and their actions, both individual and collective. It is a phase of the work of the health officer which, done well, will tremendously forward the progress of his work, bring him priceless personal associations, and give him great pleasure. Neglected or conducted in any selfish, narrow, or ignoble spirit it will destroy his usefulness and leave him frustrated and unhappy. It is a subject to which every health officer should devote his best thought and his most skilled effort.

Bacterial Contamination of Tomatoes Grown in Polluted Soil*

LLOYD L. FALK

New Jersey Agricultural Experiment Station, New Brunswick, N. J.

THE potentialities of the transmission of human bacterial diseases through consumption of raw vegetables grown in soil fertilized by nightsoil are of concern not only to peoples in foreign lands where such methods are widespread, but also here in the United States where irrigation of crops with polluted stream water is becoming increasingly common. Attempts to conserve various sewage sludges for fertilizer depend to a considerable extent on the health aspects of their use.

Examination of the published literature has revealed little direct evidence of extensive transmission of bacterial enteric diseases by consumption of raw nightsoil-fertilized vegetables. The role of polluted vegetables in areas where such diseases are endemic or epidemic is difficult to separate from the influences of polluted drinking water or insect vectors. When one is dealing with animal parasites, on the other hand, the greater resistance to the environment of cysts and eggs as compared with vegetative bacterial forms may appreciably alter the problem.

The purpose of the present investigation was to evaluate the bacterial contamination of vegetables grown in a polluting environment. The residual surface bacterial contamination of a vegetable grown in polluted soil, or artificially sprayed with a contaminant during growth, compared with that of crops grown on similar unpolluted soil, was considered indicative of the possible sanitary quality of such foods for raw consumption.

METHODS

Since literature surveys have shown the nonpathogenic coliform groups of bacteria to be more resistant to external conditions than are enteric human pathogens, use of these coliforms as indicator organisms was considered of value.

The tomato was selected for study, since it is one of the most common fruits eaten raw and grows relatively close to the ground where contamination might easily be picked up from polluted soils. Such contamination would be on the surface or in cracks and crevices in the skin; the literature on the subject has indicated little likelihood of internal contamination of healthy fruit.

Evaluation of bacterial contamination on the tomato surfaces was simple and direct. The whole fruit was macerated for one minute in a high speed Waring blendor. Coliform organisms were found to be unharmed by this treatment, nor was the resultant acid tomato juice detrimental to the organisms for at least one hour after maceration, a sufficient time for transfers and dilutions to culture media.

The culture media used were lactose broth followed by brilliant green bile broth.

To evaluate the factors that influence

* Paper of the Journal Series, New Jersey Agricultural Experiment Station, Rutgers University, the State University of New Jersey, Department of Sanitation.

the residual surface contamination of tomatoes growing in a pollutional environment, two separate field experiments were carried out after extensive laboratory experiments had been conducted.

A small sewage irrigation farm of a southern New Jersey state institution was selected as the site of the first of these experiments. Three plots were established for the growth of tomatoes. One was irrigated throughout the growing season with settled sewage to the extent of good farming practice with respect to soil saturation. The second plot had been frequently flooded with sewage in the spring before the plants were set out, but not thereafter. The third had never received sewage contamination so far as could be determined. Certain of the plants in each plot were protected with a good covering of waterproof nontoxic paper from the splashing of soil by rain. Several plants were staked to evaluate the effect of height from the ground on the subsequent contamination. The remaining plants in each plot were allowed to develop normally.

The second field experiment was conducted at the New Jersey Agricultural Experiment Station. The growing tomatoes received sprays of feces and *Escherichia coli* suspension at approximately 2 week intervals. Spraying was stopped near the end of the growing season when sampling began. All plants developed normally without stakes or ground protection.

In both localities normal farming practices of cultivation, weeding, and fungus control were employed when necessary.

RESULTS

A. *Sewage Farm Experiments*

It was noted early in this work that tomatoes with normal uncracked stem ends gave lower bacteriological counts than did tomatoes with split or cracked stem ends with crevices which could harbor dirt and bacteria. Table 1, in which the results of the sewage farm experiments are summarized, bears out this point. The normal tomatoes on the plot receiving continual sewage irrigation show about one-tenth the coliform count of abnormal tomatoes. On the plots that received previous or no sewage contamination, this ratio was about one-fourth.

Of primary interest is the almost insignificant differences in the mean contamination of normal tomatoes whether grown on soils receiving sewage irrigation, soil with previous contamination, or soil with no contamination. Abnormal tomatoes growing on soil continuously polluted showed about three times the contamination of those grown under the two other soil conditions.

There were no marked trends to indicate variation of tomato contamination with the height of the fruit above the ground. Tomatoes in actual contact with the ground showed a tendency toward higher average coliform counts, but this was not always consistent. When

Exposed	24	90	1–46,000

certain fruit were protected from the soil by spreading a nontoxic waterproof paper between the plant and the ground, no indications of lower contamination of the tomatoes were found.

The cited facts indicate that other processes whereby contaminating soil particles may reach the plant are at least as important in the contamination process as direct splashing of soil on fruit during rainstorms. The soil raised during cultivation or by the wind and the movement of insects from the ground to the plants are among these other processes.

The direct exposure of the edible portion of a plant to sunlight during growth may have a deleterious effect on the surface contaminants. The data from the sewage farm experiments were examined to evaluate the relationship of the exposure of the tomatoes to the sun and their residual coliform contamination when harvested. Because of protection under leaves, shaded tomatoes received no direct sunlight at any time. Semi-exposed tomatoes received direct sunlight for varying periods during the day. Exposed fruit received almost continuous direct sunlight in fair weather.

The information from all three plots of the sewage farm are summarized with respect to solar exposure in Table 2. Only in normal tomatoes does complete exposure result in average lower numbers of coliform organisms. As for the abnormal tomatoes, the cracks and crevices apparently protected larger numbers of organisms from the sun.

B. *Agricultural Experiment Station Study*

The field experiments at the New Jersey Agricultural Experiment Station were designed to compare the magnitude of the residual coliform contamination on tomatoes receiving sprays, during growth of feces or *E. coli* suspensions with that on tomatoes not sprayed. The fruit was sprayed at approximately 2 week intervals for 2 months. The spraying was done by means of ordinary household insect sprayers. The feces

Control	11–42	12	250	1–48,000

suspension was made up by macerating fresh feces with water in a Waring blendor and centrifuging to remove heavier solids. The *E. coli* suspension was made from 24 to 48 hour cultures on nutrient agar. The sampling period began about 10 days after the spraying ceased and continued for more than a month.

The residual coliform contamination of the tomatoes with normal stem ends is shown in Table 3. Eleven days after spraying was stopped, the median value of the number of coliform organisms per gram of tomato was still comparatively high, 800 and 2,000 for the feces and *E. coli* contaminated tomatoes respectively. However, by the 35th day, contamination was approximately that of the controls.

On tomatoes with abnormal stem ends (Table 4) similar results were obtained. Although the control tomatoes showed higher naturally occurring coliform concentrations than did the tomatoes with normal stem ends, the sprayed fruit showed counts equal to or below the controls by the 35th day after cessation of spraying.

For both types of control tomatoes, with normal and abnormal stem ends, there was no tendency toward the decreasing coliform counts found on the sprayed fruit.

It was concluded from these data that the coliform organisms of fecal origin had almost completely disappeared after a month from the surfaces of the tomatoes growing in the field. Enteric pathogenic bacteria in such fecal material might also be expected to show similar large reductions in number.

To test the possible survival of pathogenic enteric bacteria under similar field conditions, certain of the tomatoes were heavily sprayed with suspensions of *Salmonella cerro*. Suspensions of this organism with fecal material were also employed. Recovery of the Salmonella was made by plating macerated tomatoes on desoxycholate citrate lactose sucrose agar (D.C.L.S.), testing typical colonies in Kligler's iron agar, and agglutination with O—XVIII antiserum.

Of 31 tomatoes examined over a period of 27 days after spraying, only one showed the presence of *S. cerro*. This was found after 3 days, the first test period after spraying. Thereafter the organism was never recovered.

CONCLUSIONS

On the basis of these field experiments certain conclusions can be drawn on the bacterial contamination of tomatoes grown in polluted soil.

1. The residual coliform contamination on the surface of tomatoes with normal uncracked stem ends grown on polluted soil was no greater than that on tomatoes from unpolluted soils. Whether the pollution was added to the soil prior to or concurrent with the growth of the plants made little difference.

2. When the stem ends of the tomatoes were abnormally split, the coliform contamination was higher regardless of the soil. This pollution was three times higher when the soil received sewage irrigation during growth than

where the pollution had occurred prior to planting or not at all. It should be pointed out that these split stem ends would normally be removed from the tomato before consumption raw.

3. Sunlight appeared to have some deleterious effect on the contaminants of exposed tomatoes, but the protection of cracks and crevices on tomatoes with abnormal stem ends reduced this effect considerably.

4. The absence of any clear-cut tendency for lower contamination of the higher growing fruit as well as the inability of waterproof paper spread on the ground to decrease contamination indicated that direct splashing of the soil on the plant during rainstorms was not the chief controlling factor responsible for carrying bacteria from the soil to the tomato surfaces. Other factors such as wind-driven dust, dirt raised during cultivation, and movements of insects may be of equal if not greater importance in this respect.

5. When tomatoes were sprayed, during growth with suspensions of feces or *Escherichia coli* it was found that within a month the surface coliform contamination had been reduced to or below that of the unsprayed controls.

6. When *Salmonella cerro* suspensions were sprayed on tomatoes in the field, the organism could not be recovered after 7 days. This indicated a comparatively rapid death rate under these conditions compared with the fecal coliform organisms.

SUMMARY

The results obtained on the concentration of coliform bacteria on the surfaces of tomatoes grown in polluted soil indicated no abnormal gross contamination. Even when crops were sprayed with fecal suspensions, surface coliform counts were no greater after one month than on control tomatoes. The failure to find *Salmonella cerro* 7 days after its application to growing tomatoes upholds the contention that organisms of fecal origin will not be present in sufficient numbers to cause gross contamination.

On the basis of these results it is felt that the growth of tomatoes on soil that had received nightsoil or sewage sludge fertilization would yield crops which, if eaten raw, would not be likely vectors for the transmission of human bacterial enteric diseases.

ACKNOWLEDGMENT: The work in this paper is part of a study made for the Quartermaster Corps.

Take a Test

The Merit System Service booth at the American Public Health Association annual meeting in Boston attracted considerable attention with its "TAKE A TEST" exhibit. This consisted of six short sample tests, designed to illustrate the type of service being offered by the Merit System Service and to show how public health information, experience, and judgment can be measured by objective examinations.

The exhibit was repeated at the Western Branch meeting of the American Public Health Association in Los Angeles, Calif., May 30 to June 1.

The results for the Boston meeting are available in an attractively bound report which contains copies of the six sample tests, an answer key, an analysis of the scores of the persons tested, and an analysis of the items themselves. The latter illustrates the method which is used to evaluate the effectiveness of individual questions. The report may be obtained by writing to the Merit System Service, American Public Health Association, 1790 Broadway, New York 19, N. Y. $1.00.

COMMISSION ON CHRONIC ILLNESS

THE field of geriatrics, and the related field of chronic diseases at all ages, are receiving more and more serious attention from the public health profession of this continent. The symposium on present-day goals for 1950 (with which this issue of the JOURNAL opens) shows that the broad aspects of this group of problems are given top priority in planning by California and New York, second place in Connecticut, and Massachusetts and Mississippi, third place in Michigan, Montana, Oklahoma and Wisconsin. Diabetes in particular holds third place in Florida, cancer holds third place in Mississippi, and rheumatic fever second place in Oregon and third place in California.

In connection with such problems, health workers everywhere will greet with enthusiasm the recent establishment of the Commission on Chronic Illness.[1] The successes achieved in the conquest of many of the acute infections has made it possible to move forward now in a concerted attack on what is in essence the nation's major health problem.

The chronic diseases lead the list of causes of death in the United States, are responsible for at least 60 per cent of all disability, and affect practically every family. A conservative estimate places the number of persons who have a chronic disease, with or without disability, at about 25 million. Recent experience with mass surveys for tuberculosis and diabetes, as well as the findings of cancer detection clinics, indicate that the actual prevalence of chronic diseases is considerably greater than this estimate indicates.

The Commission on Chronic Illness is particularly noteworthy because it includes in its membership a broad representation of the American public as well as the major professional associations concerned with the problem. An important factor in the successful launching of the national commission has been the close coöperation of the American Hospital Association, American Medical Association, American Public Health Association, and American Public Welfare Association.

The joint statement on "Planning for the Chronically Ill"[2] which was adopted by the four professional associations in October, 1947, represents a considered

analysis of the various aspects of the problem and an excellent starting point for the work of the commission. This statement recognizes that the care of the chronically ill is inseparable from general medical care; and that, while it presents certain special aspects, it cannot be isolated from general health and medical services without running serious dangers of deterioration of quality of care.

One of the most significant features of the joint statement is its insistence on the need for a preventive approach, if substantial decline in the incidence and severity of chronic disease is to be achieved. Emphasis is correctly placed on the importance of early diagnosis and treatment as a preventive measure in chronic illness, capable of preventing complications, disability, and death in many instances. The statement underscores the great potentialities of rehabilitation in chronic illness and calls for wide expansion of rehabilitation services and programs.

It is significant in these connections that the Commission on Chronic Illness has adopted as its first objective: "To modify the attitude of society that chronic illness is hopeless; to substitute for the prevailing over-concentration on the provision of institutional care, a dynamic program designed as far as possible to prevent chronic illness, to minimize its disabling effects, and to restore its victims to a socially useful and economically productive place in the community."

The progress, in this field, of California and New York and the other states mentioned above, will be watched by all of us with absorbing interest.

PRESENT STATUS OF BCG

THE practical possibilities of the use of BCG were discussed in these columns two-and-a-half years ago.[1] The World Health Organization has wisely made immunization with BCG a basic cornerstone of its program for the eradication of tuberculosis in countries where this is the only practical approach to the problem.[2] We, in the United States, where other modes of combating tuberculosis are effectively applied, have—also wisely—been relatively slow in pushing the procedure.

We have been waiting for an authoritative pronouncement with regard to the exact area of public health practice in which BCG could be used effectively under the conditions which obtain in this country.

Such a pronouncement is now at hand in a statement presented to the American Trudeau Society by Dr. E. P. K. Fenger and adopted (with certain revisions) by the Council of the Society on May 1, 1949.

Its major recommendations, quoted in full below, will be of vital interest to our readers.

I. BCG vaccine prepared under acceptable conditions, and administered by approved technics to persons negative to tuberculin, can be considered harmless.

II. The degree of protection recorded following vaccination is by no means complete, nor is the duration of induced relative immunity permanent or predictable. The need for further basic research on the problem of artificial immunization against tuberculosis is recognized and is to be emphasized. Studies should be directed toward:
   (a) Improvement of the immunizing agent;
   (b) Development of criteria for vaccination and revaccination;
   (c) More accurate determination of which groups in the general population should be vaccinated. Several well controlled studies are underway at the present time;

(d) Promotion of carefully controlled investigative programs, which, as a rule, will be carried out best under the auspices of official agencies such as the U. S. Public Health Service, state and municipal health departments and other especially qualified groups;
(e) Devising of adequate record systems for management of statistical problems involved in recording and following large numbers of vaccinated people.

III. On the basis of studies reported in the literature, an appreciable reduction in the incidence of clinical tuberculosis may be anticipated when certain groups of people who are likely to develop tuberculosis because of unusual exposure, inferior resistance, or both, are vaccinated.
(a) In the light of present knowledge, vaccination of the following more vulnerable groups is recommended, provided they do not react to adequate tuberculin tests:
1. Doctors, medical students and nurses who are exposed to tuberculosis;
2. All hospital and laboratory personnel whose work exposes them to contact with the bacillus of tuberculosis;
3. Individuals who are unavoidably exposed to infectious tuberculosis in the home;
4. Patients and employees in mental hospitals, prisons and other custodial institutions in whom the incidence of tuberculosis is known to be high;
5. Children and certain adults considered to have inferior resistance and living in communities in which the tuberculosis mortality rate is unusually high.

IV. It is recommended that efforts be continued to perfect and to meet in practice suitable standards for the production of BCG vaccine, and that when practicable commercial firms be licensed under the National Institutes of Health to produce this vaccine.

V. The Society believes that since BCG vaccination affords only incomplete rather than absolute protection, the most effective methods of controlling tuberculosis in the general population are:
(a) Further improvement of living conditions and the general health;
(b) Reduction of tuberculous infection, which can be accomplished by modern public health methods and the unremitting search among presumably healthy individuals for patients with infectious tuberculosis;
(c) Prompt and adequate medical and surgical treatment of patients with active disease;
(d) Segregation and custodial care of those not amenable to accepted forms of therapy;
(e) Adequate rehabilitation.

VI. It is to be emphasized that BCG vaccination must not be regarded as a substitute for approved hygienic measures or for public health practices designed to prevent or minimize tuberculous infection and disease. Vaccination should be regarded as only one of many procedures to be used in tuberculosis control.

VII. Expansion of modern diagnostic, therapeutic and rehabilitation facilities is required at this time to make full use of these new methods which can accomplish further dramatic reduction of tuberculosis mortality and morbidity rates in the United States.

THE NEW LOOK IN HEALTH DEPARTMENT REPORTS

THE epidemiology of ideas is a study quite as engrossing as the epidemiology of disease. One need not be much of a philosopher to feel rewarded for the time he takes from his work-a-day affairs to observe the rise and wane of mental infections. Even a dilettante philosopher may be disheartened as he witnesses the decline of a good idea, but he will be warmed anew as he observes promising conceptions spreading steadily among an ever-widening circle of susceptible contacts.

Happily, we seem now to be in the active stage of a promising outbreak. The idea currently assuming epidemic proportions is only this: an annual health department report may be a potent educational medium. On the surface, that hardly seems a dangerously contagious thought, but it possesses, we hope, all the infectious potential of a subversive doctrine.

In one of the war years a health officer began a report with these words, " . . . due to the pressure of essential activities, and the fact that annual reports are seldom read except by those who are professionally interested in the statistical data contained therein, there will be no detailed written summary . . . " Better than any essay, this fraction of a sentence portrays a once common attitude toward annual accounting of health services.

It may be that some health officers, and the administrators of some voluntary agencies, still look upon an annual report as a chore, a nuisance to be put off or, if possible, avoided altogether. When law, or case-hardened convention, demands a published accounting, then to some hapless subordinate must be delegated the task of cramming between hard covers all the usual array of dull title pages, stilted letters of transmittal, interminable listings of board and staff members, and whatever else seems likely to dampen any curiosity the reader might have about the life-and-death tables and the tabular summaries of services rendered which fill the bulk of such a report.

Each year, however, a few more health department and health agency executives are recognizing in the year-end accounting high potentialities for influencing men's minds.

Variety in presentation in many recent reports bespeaks the planning and invention that go into present-day city and county health service. Some appear as brightly covered pamphlets, but one is in newspaper form with eye-catching headlines, each pointing up the news of a departmental activity. Another is a wall calendar, each page adorned with an interesting, informative picture and a legend explaining the service.

An example is more convincing than a generality. Only because this is so, do we single out one specimen from among many to make our point. The example, selected, from among several equally good, begins in this way, " The First Twelve Months is a report to the people of Erie County by their Health Department. Here are the highlights and accomplishments of 1948—a year of organization, and a year of beginning." These unpretentious words, set in large and friendly type, cover the page commonly condemned to carry the letter of transmittal to the Honorable Mayor and the Honorables of the Board of Aldermen to whom the perfunctory report is inevitably " hereby respectfully submitted."

" *The Past is Prologue* " is the title given to the foreword which tells briefly and clearly how the joint city-and-county health department was set up. This account, at the same time readable and solidly informative, occupies the pages commonly devoted to interminable listings of the names of board members and all the professional and clerical components of the departmental staffs—names of scant interest to any but the possessors thereof.

Under the happy heading, " Design for Service," the Commissioner gives a straightforward account of the formidable job of setting up the new county organization. Then follow the stories of the departmental activities, each clearly told, each provocatively named, each helpfully illustrated with news photographs of people doing things, drawings skillfully employing stylized figures, graphs readily comprehensible, and useful charts and maps.

The report is so solidly thought out and so ingeniously devised that the temptation is great to tell about its mechanics and the way it was gotten out on time. But these matters are not the point. However good the form of presentation, it is the substance that interests us, for here is a " report to the people," a report written in words that are meaningful to the men and women of Erie County whose hard-

come-by cash the department spends. These people have every right to know what is done with their money. Further, they have every right to expect to be told in a narrative written in terms of their comprehension. And this the Erie County Health Department does successfully.

Library shelves are cluttered with annual reports. Take one at random. Blow away the dust. Open it, and the chances are good that you will find: a lifeless title page naming the year of the "annual report"—two words that warn of the dullness awaiting the unwary. Then will follow a stilted letter of transmittal, then a listing of names. Whatever else may come between these custom-ordained flourishes and the bulk of tables is almost sure to bear the stigmata of a deadly annual repetition, amended only as necessity demands. Reports of this type served only a single purpose: they fulfilled the letter of the law or the equally unrelenting dictate of sclerosed custom.

Not all annual reports of the past were so wasteful and futile, to be sure. Through the decades of general neglect, some few health officers, and agency executives, continued to write reports that were revealing and presumedly influential. But they were few. Now a blessed change is clearly evident. So many health administrators are turning their reports into documents that really report—in terms of the reader's interests—that the 1948 crop seems a far cry indeed from the typical products of the past decades. Public health services generally will be greatly strengthened when all men and women in authority strive to make their year-end accountings as readable and influential as is this year's "report to the people of Erie County."

GRANTS-IN-AID FOR PUBLIC HEALTH

A RECENT *Bulletin* of the United States Public Health Service,[1] telling the story of "Ten Years of Federal Grants for Public Health," is significant as a record of an outstanding public service and as a guide for future policy.

The first Federal Social Security Act of 1935, among its general provisions, authorized substantial federal grants to the states for assistance in the development and support of state and local public health services. Formulation of the basic policies under which this program was carried out we owe largely to Dr. C. E. Waller in charge of the Division of Domestic Quarantine of the U. S. Public Health Service from 1931 to 1939. Grants for general health services actually began in 1937; for venereal disease control in 1939; for tuberculosis control in 1946; and cancer control, mental hygiene, and hospital planning and construction are now also specifically included.

Allotments to the Public Health Service for such grants-in-aid have increased from under 8 millions in 1937 to under 22 millions in 1946 and over 35 millions in 1948.

Small as these appropriations are in relation to the total federal budget, the results accomplished have been nothing less than spectacular. During the period 1935 to 1946, the number of state health departments reporting specific identified projects in various specialized fields, in or prior to the designated year, increased as follows: tuberculosis control 19 states to 46 states; venereal disease control 28 to 45; industrial hygiene, 4 to 38; public health nursing, 30 to 46; public health education, 16 to 43; dental hygiene, 16 to 43; cancer control, 5 to 27; nutrition, 7 to 29. The significance of such broadening of scope is great; and the major

stimulus to such development has come from the grants-in-aid. In the same period, and largely under the same stimulus, full-time local health units have increased from 561 to 980.

It is encouraging to note that the federal program has not—as some had feared—tended in any way to diminish local initiative. Under the system of administration in force (using in most cases a matching requirement), the increase in state and local funds has exceeded the increase in federal funds. In 1937, a grand total of 22 millions was spent for all state and local services, of which 37 per cent came from federal sources (including both the U. S. Public Health Service and the U. S. Children's Bureau). In 1946, the grand total was 109 millions, of which only 28 per cent came from Washington. Federal grants have not resulted in a decreased sense of local responsibility, but exactly the reverse. They have primed the pump for more and more fruitful drafts on state and county resources.

The *Bulletin* under review is a purely factual one and very properly contains no discussion of the basic philosophy of federal grants-in-aid. This is a subject, however, on which this JOURNAL, as the organ of the public health profession (which is on the receiving end of the process) may properly express an opinion. Every now and then an address is delivered, or an essay is written, which views with alarm the fearful prospects of federal domination of state policies supposedly involved in grants from Washington. It happens that the writer of this editorial has for more than thirty years been a member of a state Public Health Council which has been the recipient of federal grants; and is in position to testify that such fears are wholly illusory. Experience has shown that federal fund-granting agencies are normally highly conscious of the fact that each state has two senators, who are quite readily accessible to a word from the state capitol. It is reasonably certain that if there are faults in the actual operation of the program, they lie in too much, and not too little, deference of Washington agencies to local opinion.

We sometimes meet with statements which contrast the alleged bureaucratic control supposed to be involved in government grants with the freedom of initiative characteristic of the contributions of voluntary agencies. This contrast again is fallacious. We do not for a moment imply that voluntary agencies have, in practice, exercised undue pressure. Such is not the case. That they could exert such pressure, if unwisely directed, is however clear. Their managing boards are, in actual fact, largely self-perpetuating and the general public has no control over their conduct. Governmental agencies, on the other hand, are responsible to the citizenship which supports them. They are highly susceptible to pressure from individual citizens or groups of citizens. It may be suggested that those who lie awake at night in fear of federal domination have at the bottom of their minds a different concept of government, which assumes that domination by someone is essential and that such domination can best be exercised by themselves. In a democracy, as we conceive it, the government is Our Government. It cannot tyrannize over us because we control it; and we accept the underlying faith of the founding fathers in the ultimate soundness of the democratic process.

ANTISEPTIC SEA WATER

SOME challenging problems are raised by recent studies of Ketchum, Carey, and Briggs[1] on the viability of colon bacilli in sea water. These investigations, conducted at the Woods Hole Oceanographic Institute, have brought out two major points.

In the first place, the observers have found that, when sewage is discharged into tidal estuaries, the reduction of coliform organisms is much more rapid than that which could be accounted for by dilution (the dilution being measured by changes in salinity).

In the second place, the investigations showed that, when sea water was inoculated with *Escherichia coli*, the colon bacilli died off at a reasonably rapid rate, over a tenth of the initial population disappearing in each 24 hours so that in a week the number left was infinitesimal. When the sea water was boiled, the same result was observed. The striking new fact was disclosed, however, that, when the sea water, instead of being boiled, was autoclaved for 10–15 minutes, the rate of reduction was slowed down to one-twentieth of its normal rate, so that the first 10 per cent reduction was apparent only after 20 days. The authors are inclined to attribute this phenomenon to the presence of antibiotic or other antibacterial substances which are destroyed by autoclaving but not by boiling. It would seem equally plausible to assume that the mortality of colon bacilli in ordinary sea water is due to lack of necessary food stuffs (rather than to toxic effects); and that the process of autoclaving produces split products which enable the coliform bacteria to maintain themselves more efficiently.

Clearing House on Public Health Salary Information and Personnel Needs

OKLAHOMA RECRUITS

Oklahoma has a state personnel board serving the departments of health and welfare and the crippled children and employment security commissions. Like every other state, Oklahoma suffers from personnel shortages in its state and local health departments. Both state and local health department personnel supervisors visited colleges for recruiting sanitarians. They were so persuasive that all sanitarian positions in the State Department of Health have been filled through the hiring of 15 sanitarians. In addition, Roy Dillon, supervisor of the merit system, reports that there is a register of 21 college men who have passed the written examination for this position. Joe Rogers, the health department personnel officer, reports that during the war no exceptions were made to the requirement of college degrees for sanitarians. He hazards the guess that no other state made so good a record. (Does anyone wish to challenge this statement with a better success story?)

The results show what can be done if recruitment is made a major concern. It points further to the necessity of convincing appropriating bodies of the danger of allowing public health workers to become the new "submerged" profession, now that teachers have finally announced and acted upon the announcement that they are citizens as well as public servants. There has been some fear that recent $500 increases in teachers' salaries in the state may make the recruiting job, particularly of sanitarians, harder.

Illustrative of the personnel board's activities are two Oklahoma newspaper clippings. One is a small news item in the *Daily Oklahoman* entitled "Help Wanted Sign Hung Out by State" announcing examinations for stenographers and other office personnel; a later one, an illustrated news story of a photogenic University of Oklahoma graduate who went through the examination, interview and hiring process, and is now employed as a typist in the State Personnel Board. Its title is, "State Offers Job Opportunity. Applicant Knows Answers"; its punch line is, "A similar process is going on for numerous other young people seeking government jobs."

WISCONSIN UPS PUBLIC HEALTH SALARIES

Following a legislative survey of salaries and job specifications in the state, a Senate Bill passed by the recent session of the Wisconsin State Legislature establishes $10,000 as the state health officer's salary, a one-third increase over the previous ceiling. At the same time, increases of from 5 to 10 per cent in the salary ranges of all medical positions in the State Health Department were authorized. These increases had been authorized on a temporary basis a year earlier while the study was in progress.

Following this state study the personnel officer of the State Health Department is analyzing local health department salaries. It is to be presumed that the state level increases will have some influence on raising local salaries as well.

RHODE ISLAND'S RECRUITING DRIVE

Unusual success in recruiting workers in Rhode Island prompted the request for a description of its plan, which

uses the services of a professional advertising agency. Arnold McDermott, Chief of the Administration Division, Rhode Island Department of Civil Service, prepared the following discussion of the plan which seems to be solving some of the problems of recruitment for governmental positions in that state.

For almost two years, the Rhode Island Department of Civil Service has carried on an intensive recruiting program to supply the personnel needs of the various state departments. In the first year of this drive the number of applicants per examination increased approximately 70 per cent, longer lists of eligibles were established, and the needs of appointing authorities were more adequately met.

With the revision of the state pay scales in July, 1947, and with the termination of war contracts in Rhode Island industries, the time seemed appropriate to capitalize on the improved salary plan and the increasingly favorable labor market. Moreover, an analysis of examination costs clearly showed that the process of repeating examinations was expensive.

Since the conventional civil service recruiting methods had been inadequate in the past, the services of a professional advertising agency were engaged to conduct a recruitment campaign. The drive was initiated by an advertisement appearing in the 6 daily newspapers of the state. The ad was large enough to arouse the immediate interest of the public. It was supplemented by one minute spot announcements and chain breaks over Rhode Island radio stations. Window displays were set up in the offices of the Employment Service and the Bureau of Internal Revenue in downtown Providence, and fliers describing job opportunities were distributed in the Employment Service offices.

Procedures for handling the advertising were worked out carefully by the advertising agency and the Department of Civil Service. The agency negotiates with newspapers and radio stations while the department reviews program and determines policy. The radio scripts are used by the stations as public service announcements without charge. The stations, of course, fit the copy into their program schedules as they see fit. Nevertheless, the record shows that the 11 Rhode Island stations donate an average of 300 spots per month to the state, many of them favorably located in high rating news or record shows.

The campaign thus far appears to be tremendously successful. In the fiscal year 1946-1947, with no advertising, 3,573 applications were received for 132 announced examinations—an average of 27 applications per examination. In the current year, with advertising, 180 examinations announced brought 8,286 applications—an average of 46 per examination. This represents a 69 per cent increase in the average recruitment per examination.

Special campaigns to recruit in critical areas are put on from time to time. An intensive advertising campaign for mental hospital attendants resulted in the filling of all positions for male and nearly all for female attendants at the State Hospital. Recently, a high-powered drive for clerical workers brought a total of 2,400 applications from 1,100 candidates. In this drive. besides the regular advertising, members of the staff of the Department of Civil Service visited commercial classes of the various high schools to encourage interest among the senior class in civil service examinations.

The department's budget for advertising amounts to approximately five per cent of the total appropriation.

Credit Lines

"MIND IN THE SHADOW" HAS ITS EFFECT

The Columbia Broadcasting Company has published a very effective brochure, with line drawings, that tells the story of the *Mind in the Shadow* broadcast, first made over its nation-wide network on February 2 and rebroadcast on February 20, 1949, following insistent public demand. This is a sharply documented story of the shocking inadequacy of the institutional care now being given men and women whose minds are sick—and a story of the prevailing public attitude toward mental illness. The brochure manages to convey some of the explosion this broadcast created and quotes what Minnesota's Governor Youngdahl, Dr. Menninger, the press, and many others said. The key to what CBS itself believes was the important effect is its selection of this quotation from a letter: "I now feel free to pursue action to get mental treatment for a loved one . . . action long shunned because of my desire to hide, ignore, or simply silently hope for the best . . ."

The hour long program is available for rebroadcast in 16m., 33⅓ R.P.M. electrical transcriptions for $9.40, including shipping charges. A limited number of scripts are available without charge. Columbia Broadcasting Company, 485 Madison Avenue, New York, N. Y.

THE SOUTH AND A HEALTH PROGRAM

The nation is no longer "half slave and half free" in the sense that Lincoln used the terms. But that there is still unnecessary regional inequality has long been abundantly clear. Thus, *How a National Health Program Would Serve the South* and *Providing Adequate Health Services to Negroes*, point up the fact that a national health program would provide the means by which the low income southern states might overcome many of their deficiencies, particularly among Negroes, in public health and medical care. Each pamphlet makes use of comparative statistics for southern states and those in other regions and for white and non-white. A non-white mortality rate from tuberculosis more than three times that for whites, a syphilis rate more than four times, are among the dramatic but even yet too little acted upon figures. Both pamphlets are restrained, factual, and effective. Along with them was received another, *Restrictions on Free Enterprise in Medicine*, which details the restrictions upon freedom of practice by members of its own profession, that organized medicine has fostered.

The three pamphlets are available, presumably without charge, from The Committee on Medical Economics, Washington, D. C.

MINNESOTA GETS ON THE BAND WAGON

Minnesota has been one of the few states without a permissive health unit law. But one was enacted by the 1949 legislature after having been defeated in 1947. Now comes word that Hennepin County has organized the first full-time county health department in the state. A five member county board of health was authorized by the County Commissioners, as well as a one mill levy on rural residents, numbering about 140,000. The board is now seeking a county health officer. When he assumes his duties, all townships, village, and city health officers, except in Minneapolis, will be relieved of their responsibilities in the interest of a unified administration in the rural areas of the county.

Congratulations to the Hennepin

County Health Council and the County Public Health Nursing Association, which are reported to have been among the "key organizations behind the drive." It can be assumed that congratulations are also in order for the state health department.

WESTERN BRANCH ANNUAL

The 1948 *Annual* of the Western Branch, A.P.H.A. has recently been published and contains a resume of the papers presented at the 1948 meeting in Salt Lake City. The subjects discussed were: Child Health, Public Health Administration and Hospital Programs, Public Health Aspects of the Cancer Problem, Infectious Diseases, and Public Health Hazards. The *Annual* was prepared by a publication committee whose chairman was Dorothy B. Nyswander, Ph.D., of the University of California School of Public Health. The Committee and the Western Branch are to be congratulated for making this material available to all of its members.

CEREBRAL PALSY PROGRAM OF NATIONAL SOCIETY FOR CRIPPLED SUMMARIZED

A "Liaison Report of the National Society for Crippled Children and Adults to the American Academy of Cerebral Palsy" is a summary of the society's national cerebral palsy program initiated in 1946. It reads as an impressive record of public and professional education, liaison with medical specialty groups, scholarship programs supported by a variety of agencies, workshops, films, etc., through a cerebral palsy division of the society. The medical advisory council of the society took the initiative in forming the American Academy for Cerebral Palsy, whose Chairman, Winthrop M. Phelps, M.D., serves as liaison officer with the national society of whose medical advisory council he is also a member.

This document is illustrative of the magnitude and complexity of the cerebral palsy problem and the programs for dealing with it. It brings to mind the necessity for coördinating the various efforts in this field and the responsibility that agencies operating in it have to fit them into a well rounded harmonious pattern. Otherwise, the public which supports the activities may shut its collective pocketbook in irritation over its confusion.

The 14 page mimeographed report is presumably available without charge from the National Society for Crippled Children and Adults, 11 South La Salle Street, Chicago 3, Ill.

FOOTNOTE: The news has recently been announced that the newly created National Foundation for Cerebral Palsy (*A.J.P.H.* 39: 491 (Apr.), 1949) has changed its name to the United Cerebral Palsy Associations. The association is making plans for bringing together all the agencies interested in cerebral palsy to develop a national and local program that is neither competitive nor overlapping. Its Executive Director is Pat Rooney, formerly Associate Director of the American Social Hygiene Association in charge of membership and finance. Its Medical Adviser is Winthrop M. Phelps, M.D. Its temporary offices are at the New York Academy of Medicine, 2 E. 103rd St., New York City.

As a second footnote, readers might be referred to "Parents in Arms" by Beatrice Schapper (*Survey* 85:6 (June), 1949) for light on some of the motivations and emotional drive out of which have converged these lines of cerebral palsy activity.

BLUEPRINT FOR WORKING TOGETHER

In Montgomery County, Maryland, the Health Department and the Tuberculosis Association have drafted a five year plan for working together toward the goal of removing tuberculosis from the roll of public health problems in the county. By the plan the department assumes complete responsibility for routine clinic activities and provides personnel for the follow-up necessary in an increased case finding program. For this purpose a tuberculosis director and medical-social consultant in tuberculosis have been added to the Health Depart-

ment staff. Case finding activities, including the necessary health education, are the responsibility of the association.

In commenting on the plans, *Montgomery County Community Health* says, "This plan is unique, not in the working relationship set forth but rather in the clear line of responsibility worked out between an official tax-supported agency and a voluntary one . . . It is a workmanlike partnership, in which each recognizes and respects the contribution of the other."

USING YOUR LOCAL NEWSPAPER

Its front splashed with imaginary headlines about health matters in Louisiana and the maxim in red, *Health News is Good News*, a leaflet of the Louisiana Health Department suggests the usefulness of the local newspaper in telling people about the health department and getting their active use and support of it. Humorous drawings indicate what interests editors. The leaflet is well worth a look by those who have responsibility for health education through mass media.

NOTHING NEW UNDER THE SUN

In case anyone believes that a medical care program is both revolutionary and modern, he should read the July, 1949, issue of the *Baltimore Health News*, which is devoted in full to "The Origins Of The Baltimore City Medical Care Program, 1776–1948," by the Health Commissioner, Huntington Williams, M.D. It would appear that the Baltimore Medical Care Program which matured only very recently was the logical outcome of a long history of evolutionary development.

EXPLOITING MEDICINE MAN TECHNICS

The Florida State Board of Health, joining in the national campaign against venereal diseases, in addition to newspaper and radio publicity and talks, has come up with a new idea in venereal disease health education to discover early infectious syphilis. During July and August, five field investigators with cars especially equipped with loud speakers and portable record players went into certain areas, particularly at cross-roads filling stations, or in front of "jook joints" to play popular musical records. When a crowd had gathered, the program began. Special recordings put out by the Columbia Broadcasting Corporation were used to get across the message of prevention and early cure of the venereal diseases. At the same time pamphlets and other education material were distributed to spectators.

TUBERCULOSIS IN INDUSTRY

The Industrial Hygiene Foundation (4400 Fifth Ave., Pittsburgh 13) has prepared a special pamphlet, *Tuberculosis in Industry*, of a panel discussion of the medical conference held in connection with the foundation's 13th annual meeting in Pittsburgh in November, 1948. The six panel papers discussing mass x-rays, placement of tuberculous workers, job security, compensation, should be of interest to the industrial hygienist in the health or labor department and in industry.

The Industrial Hygiene Foundation is made up of a variety of large industrial concerns. The Chairman of its Medical Committee is A. J. Lanza, M.D., Chairman of New York University's Institute of Industrial Medicine; among the members of its Board of Trustees are Dr. Lanza, C. D. Selby, M.D., Medical Consultant of General Motors, Philip Drinker, Sc.D., of the Harvard School of Public Health, and R. R. Sayers, M.D., Chairman of the Medical Advisory Board, U.M.W. Welfare and Retirement Fund.

WORTH ACQUIRING

Social Services in Britain will give you in summary form what social services are being carried on in Britain by

the government and by private agencies. Includes a selected bibliography. British Information Services, 30 Rockefeller Plaza, New York 20.

A packet of materials on cerebral palsy is being distributed by the National Society for Crippled Children and Adults. They are:

Spastics Can Be Happy, by W. W. Bauer, M.D. Reprinted from the *Christian Herald*, May, 1949; *How to Choose Toys*, by Grace Langdon, Ph.D., published by the American Toy Institute: *The Crippled*, by Lawrence J. Linck, reprinted from the 1949 *Social Work Year Book; Preliminary Steps in the Setting Up of a New Treatment Unit*, by Jean Botek, O.T.R.; " . . . *but the Spirit Giveth Life*" by Howard A. Rusk, M.D., reprinted from the *Survey*, April, 1949.

These are available, presumably without charge, from The National Society for Crippled Children and Adults, 11 South La Salle St., Chicago 3.

Instructional Plan for Basic Tuberculosis Nursing has been added to the curriculum guide for schools of nursing, of the National League for Nursing Education. It is a study guide for instructors and supervisors that is adaptable and pertinent to in-service training programs for public health nurses. National League for Nursing Education, 1790 Broadway, New York 19, $1.00.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted.

America's Health: A Report to the Nation—*By the National Health Assembly. New York: Harper,* 1949. 388 pp. Price, $4.50.

For those with brief memories a word may be said of the origin of the National Health Assembly before commenting upon this belated volume.

The 800 men and women bidden to Washington in the first week of May, 1948, were chosen with nice discretion as to their professional and intellectual competence and freedom from partisan political bias. On no previous occasion within the reviewer's memory were the citizens of the United States so well represented by persons possessed of the essential facts and competent to express sound opinions as to the needs of our people for health protection and medical care and to give voice to opinions on basic policies to satisfy these needs.

The role of the U. S. Public Health Service cannot be too generously acknowledged. Their officers and staff made the signal success of the meeting a matter of universal admiration. The modesty, competence, and open-mindedness of these career men and women made them perfect collaborators at the official level with no least hint of bureaucratic rigidity or dominance.

A spirit of critical give-and-take and an astonishing perfection of the democratic pattern of discussion and decision revealed the quality of the members and can be read in each of the 14 section chapters and the one devoted to international coöperation in health.

There is no better brief endorsement of the contents than a paragraph of Mr. Ewing's introduction: "Certainly no one can go through this book without recognizing what a wealth of factual information and food for thought is provided. Practically every vital problem affecting the health of an individual or of the community is here explored with painstaking detail."

This book carries no padding. Each chapter poses its question briefly, puts the incontrovertible facts clearly, draws reasonable conclusions for achieving a 10 year goal, names the participants and stops. One must indicate the chapter subjects as a least excitant to public and a wide reader curiosity:

Medical and Health Personnel
Hospitals
Local Health Units
Chronic Disease and Aging
Maternal and Child Health
Rural Health
Research
Medical Care
State and Community Planning
Rehabilitation
Dental Health
Mental Health
Nutrition
Environmental Sanitation
International Cooperation

While it is tempting to play favorites, it is clear that there is so much experience and imagination shown in dealing with each topic that even a fanatical promoter of some one-thought panacea is silenced in the face of such balanced and comprehensive coverage.

This is truly a remarkable record of fact and opinion. The print, format, and book-making are good, the index sufficient. Colleges will use this book for many years as source and reference,

and it is excellent lively reading for as many courses as there are chapters.

While physicians were a suitable minority in planning and executive committees and in each section, 10 of the 14 sections were chaired by doctors of medicine.

This is a report intended to influence national policy in the United States. It is not a program, a project, a blue print. The people and their Congress will do well to study and capture the spirit of this report before demanding laws to commit us to a pattern of obligatory conduct as persons or as a people.

HAVEN EMERSON

Safety Thru Elementary Science—*Washington, D. C.: National Education Association,* 1949. 40 pp. Price, $.50.

This bulletin, like others sponsored by the National Commission on Safety Education, sparkles with humorous illustrations but gets down to serious business in its text. Prepared for teachers—as were the others in the series—this bulletin, as the title indicates, approaches safety via the science teacher and the elementary grade pupil. Demonstration is the core of science instruction. "One meaningful experience is worth a thousand words," declares the introduction.

Approximately 200 demonstrations or suggested activities are outlined, each connected with a possible hazard, and each rooted in an understanding of science and in desirable practices. The subjects covered include safe use of mechanical toys, tools, and machines; safe use of electricity; fire prevention; hazards caused by animals, and hazards caused by plants. The associated outline form is a feature of the bulletin and adds to its readability. An appendix deals with descriptions of harmful reptiles, insects, arachnids, and plants.

Credit for assembling the material is given to Anna E. Burgess, directing principal of Cleveland Public Schools, and former Cleveland supervisor of elementary science. Specialists in science and education from a dozen states reviewed the bulletin and offered suggestions.

Aside from school use, this publication will be helpful to public health nurses, health educators, and safety consultants who share in the responsibility for the education of the public in accident prevention. The more we know about the causes of accidents the less fear we shall have for the safety of ourselves and for others whose care is our responsibility.

The avoidance of many common accidents is predicated upon a knowledge of elementary science.

ETHEL M. HENDRIKSEN

Having Your Baby. Modern Instructions for Expectant Mothers—*By Leonard H. Biskind. Portland, Ore.: Western Journal of Surgery Publishing Co.,* 1949. 96 pp. Price, $2.50. Blue Paperbound Economy Edition, price, single copy, $1.00.

This little book in outline form attemps to cover all the questions a modern prospective mother is expected to raise. It assumes that the answers to these questions are essentially those her private physician would, or should, give at each prenatal visit in his own office. Dr. Biskind urges the expectant mother not to hesitate to discuss her obstetrical problems with her physician. However, "on the other hand, please respect his time, realizing that he has other patients to attend and other duties to perform." This leads to the statement that there are prenatal classes in many large cities which she may attend after consulting her obstetrician. The fact that many expectant mothers have not been able to secure satisfactory answers to certain of their questions is one of the reasons why these prenatal classes have become so popular and drawn thousands of mothers to their support.

The questions are answered categorically under 57 captions in a matter of fact manner, with a full page given to each subject regardless of whether or not the material takes up little or much space, thus a considerable amount of blank space appears. The questions have been well chosen and few obstetricians would differ with the factual answers. No attempt, however, has been made to present the material by modern methods of health education. A helpful glossary and index complete the book.

While this book is sound from the obstetric standpoint, there is much to be desired to capture and hold the attention of mothers by attractive illustrations and format such as one finds in other modern books and pamphlets on prenatal care.

RICHARD ARTHUR BOLT

New Hope for the Handicapped—*By Howard A. Rusk* and *Eugene J. Taylor. New York: Harper,* 1949. 231 pp. Price, $3.00.

The relatively new field of rehabilitation, the restoration of the handicapped to social and economic usefulness, offers millions of disabled persons new hope for productive and independent living; in the past 20 years, we have given more and better attention to the handicapped among us than ever before in history. The story behind the rapid and remarkable evolution of rehabilitation as the vital "third phase of medical care" is told fully and effectively in *New Hope for the Handicapped.*

The authors, Dr. Howard A. Rusk and Eugene J. Taylor, combine an encyclopedic knowledge of their subject with an ability to discuss it in terms the layman can understand. Case histories throughout the book offer a frame of reference on which handicapped persons can predicate their own hopes for physical restoration, and medical and social service personnel will gain a greater understanding of the field of rehabilitation from the social and historical analyses presented.

The chapters devoted to the growth of rehabilitation in the armed services and the Veterans Administration are particularly impressive; starting almost from scratch during the second World War, the government and the military organizations now provide the handicapped veteran with the best rehabilitative and medical treatment anywhere in the world. The far larger numbers of civilian disabled are not, unfortunately, as well treated. Although most of the centers for rehabilitation of the civilian disabled are excellent in themselves, the authors point out that they are inadequate to care for all those persons who could be helped by rehabilitation. Persons with disabilities formerly thought irreparable represent a vast economic and social potential to the nation which must be developed by effective, coördinated service to all the handicapped everywhere. HENRY H. KESSLER

A Guide to the Teaching of Health in the Elementary School—*Albany, N. Y.: University of the State of New York,* 219 pp.

This guide, prepared under the supervision of the Division of Health, and Physical Education of the University of the State of New York, with the coöperation of many individuals, is "an outgrowth of teachers' experiences in guiding children in the classrooms of the state and of the work of health teaching committees and study groups of teachers, supervisors and administrators." It presents a philosophy for a modern functional program of health instruction based on the needs and interests of pupils.

Due consideration is given to the integration of health teaching and school health services. The guide points out the need for providing an environment that is favorable to healthful living and

for guidance of children as they grow and develop. The educational implications of vision testing, hearing testing, and of medical examinations are discussed at length.

Specific suggestions are offered regarding procedures to be used in building a curriculum to meet children's health needs. This section includes consideration of school-home coöperation, finding and meeting children's health needs, and the physical and social environment of pupils.

A series of "resource units for health teaching" includes discussion of various health problems and suggestions concerning their solution. Desirable pupil activities, according to grade level, are included.

This guide should be of value to individual teachers and also to curriculum committees. It is well organized, constructive, and stimulating.

CHARLES C. WILSON

Medical Etymology—*By O. H. Perry Pepper. Philadelphia: Saunders,* 1949. 263 pp. Price, $5.50.

The author points out that less than 5 per cent of our medical terminology is of Anglo Saxon origin and he has presented a refreshing volume that shows where the rest of it comes from through the Greek, Latin, Arabic, Semitic, French, or Italian languages. The volume represents a rich source for students, especially those of today who do not approach science with the background of Latin and Greek. Indeed, anyone who wishes in condensed form an accessible list of words with their derivation and definition will find this volume fascinating.

REGINALD M. ATWATER

A Psychiatric Approach to the Treatment of Promiscuity—*New York: American Social Hygiene Assn.,* 1949. 81 pp. Price, $.75.

This report is a sequel to a study, *An Experiment in the Psychiatric Treatment of Promiscuous Girls,* initiated by Dr. Ernest G. Lion and others, which was published as an appendix to the *Journal of Venereal Disease Information* in 1945. The present report reviews application of the method to males as well as females.

With the support of the U. S. Public Health Service and other agencies, arrangements were made for the referral of promiscuous or potentially promiscuous patients of the San Francisco Venereal Disease Clinic to a Psychiatric Service, consisting of a psychiatrist, psychologist, and psychiatric social worker. Histories of the extent and character of promiscuity, the patient's attitude, and relevant details were secured by the psychiatric social worker. Patients who desired help and were considered able to benefit from it were seen by the psychiatrist. A number of psychological tests and the records of social and health agencies were utilized to assay the patient's potentialities.

Of the 1,557 patients who had been seen in the Psychiatric Service, this report deals with 620, selected serially in order of their referral. Forty-three per cent of the studied cases did not utilize the service. It was possible to follow 52 per cent of those who did avail themselves of this service. Of those followed, 83 per cent were classified as improved. In effect, then 18.5 per cent of all cases referred to the Psychiatric Service were known to have abandoned or reduced the amount of their actual or potential promiscuity during a subsequent period of one year.

A number of interesting tables are given relating to the 620 patients referred to the service, bearing upon marital status, family background, education, intelligence, promiscuity, race, and other factors. It is questionable, however, how much weight can be placed upon these data because of the selection of the patients for referral. Of great

interest are the discussions of the types and motivation of the patients seen. This report will be of greatest interest to everyone concerned with venereal disease control. JAMES H. LADE

Suggested School Health and Safety Policies—*Fresno, Calif.: Fresno County Schools,* 1949. 85 pp.

This is a well prepared 85 page mimeographed handbook with a distinctive format which enables easy use. It represents a coöperative undertaking of the Fresno County (California) Elementary Principals Association, the Fresno County Health Department, and the Office of the Fresno County Superintendent of Schools.

Addressed to school administrators, the handbook contains detailed discussions of factors essential to the health and safety of school children. The need of providing worthwhile and lasting contributions to their health and welfare is stressed. The responsibility of each member of the school staff, including specifically the administrator, teacher, nurse, custodian, lunchroom director, and bus driver, are set forth and documented by quotations from the California law. The important fact that the health and safety of school children require the coöperative action of each staff member is emphasized. Suggestions are included for obtaining the coöperation of health agencies and parents, and the list of pertinent services offered by the office of the County Superintendent of Schools, is particularly helpful.

The handbook deals with practical situations pertaining to local conditions. It does not include a teaching guide but contains considerable material which can readily be adapted to classroom teaching. Although designed specifically for use in Fresno County, it might well serve as a working model for the development of handbooks in other areas. It should be of particular interest to health departments as an indication of the manner in which health and school authorities can coöperate in this field. W. GRAHAM COLE

Fundamentals of Pulmonary Tuberculosis and Its Complications—*Sponsored by the American College of Chest Physicians. Springfield, Ill.: Thomas,* 1949. 470 pp. 182 illus. Price, $9.50.

This volume, sponsored by the American College of Chest Physicians, was written by more than a score of tuberculosis specialists. In consequence, while there is some duplication, there is surprisingly little disagreement. This method of presentation has the advantage of bringing to the reader opinions based on personal experience.

All of the phases of tuberculosis of interest to the student and physician are considered in a most practical way. Not much space is given to the questionable theories. Controversial matters are minimized. Some features, frequently neglected, such as psychosomatic and public health aspects of the disease, are adequately treated.

There is an excellent chapter on major surgical procedures showing a favorable attitude toward primary resection in selected cases. The role of the bronchial tree in the pathogenesis and treatment of tuberculosis is discussed in detail.

BCG is given qualified approval. Streptomycin therapy is discussed in relation to the several types of the disease and its tuberculous complications. Therapeutic abortion in pregnancy is frowned upon.

One gets the impression in reading this book that the authors are interested in their patients and not merely in the disease tuberculosis. If a patient, as a result of treatment, becomes a respiratory cripple, even though the disease becomes stabilized, the result should not be considered "excellent."

The neglect of the tuberculin test and

sputum examination for tubercle bacilli is responsible for most of the errors in the diagnosis of tuberculosis today.

JOHN H. KORNS

Help Yourself to Better Sight—*By Margart D. Corbett. New York: Prentice Hall,* 1949. 218 pp. Price, $2.50.

This volume repeats many of the shortcomings of previously written books on the same subject. Half-truths and fiction about improving eyesight through exercises are represented by the author as a further development of Bates' discredited techniques.

The author fails to mention the excellent critical research reported within the last three years by the staffs of the Wilmer Eye Institute in Baltimore and of the Washington University Department of Ophthalmology in St. Louis. The results of both these studies in treating myopia with exercises were largely negative. Nor does the author mention the recent findings of the U. S. National Bureau of Standards, of the Inter-Society Color Council, of the American Committee on Optics and Visual Physiology representing three ophthalmological organizations, and of the Association of Schools and Colleges of Optometry. Studies made under the auspices of these groups showed that practice and coaching often will enable a color-deficient person to show an improved score on an imperfect test. Such practice and coaching, however, do not contribute to rehabilitation in the true sense of the word because the skills developed have no practical value except to defeat the purpose of the screening test.

Possibly such exercises as "the elephant swing, the sailor swing, shuttling the 'o,' the shuttle shift, the owl and crescent swing" will appeal to the more impressionable, unscientific faddists, and possibly might not do any real harm. But the author recommends one exercise which consists of looking "right through and past the sun itself." Such practice may result in scorching the retina and leaving a permanent and large blind spot.

The whole tone of the work is to encourage self-diagnosis and treatment without any advice as to the desirability of a check-up in order to rule out the possibility of pathological eye conditions, the early recognition of which might permit the saving of eyesight. The book. therefore, is likely to have pernicious effects. FRANKLIN M. FOOTE

BOOKS RECEIVED

Listing in this column acknowledges the receipt of books and our appreciation to the senders. Space and the interests of readers will permit review of some, but not all, of the books listed.

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

Advancing Science Note—Throat washings from German measles patients, if frozen, will remain infective for at least 90 days and will produce rubella in susceptible people. The artificially induced disease does not differ from the natural product. As you will realize, this is a contribution to the scheme of immunizing susceptible brides before they become pregnant.

ANDERSON, S. G. Experimental Rubella in Human Volunteers. *J. Immunol.* 62, 1:29 (May), 1949.

Pocket-Book Neuritis—Are the cosmeticians trying to outlaw the Toni Home Wave in your bailiwick? Don't let yourself be dragged into the battle on health grounds. It says here that careful studies do not support the contention that toxic manifestations result from cold wave preparations.

BEHRMAN, H. T., *et al.* The Cold Permanent Hair-Waving Process. *J.A.M.A.* 140, 15: 1208 (Aug. 13), 1949.

Loathsome, and Dangerous, Too—Three salmonella species, among many others, were recovered from the gut of cockroaches. This suggests that the popular tolerance of these pests is unwise. Especially in households with infants, roach control is clearly of highest importance.

BITTER, R. S., AND WILLIAMS, O. B. Enteric Organisms from the American Cockroach. *J. Infect. Dis.* 85, 1:87 (July-Aug.), 1949.

Pointed Round Table—A variety of evidence is offered which seems to say that nutritional deficiencies modify the usual course of experimental virus infections. Broad generalizations are avoided but the point is offered that viruses, unlike most pathogens, seem to thrive best under conditions of active tissue metabolism.

CLARK, P. F., *et al.* Influence of Nutrition in Experimental Infection. *Bact. Rev.* 13, 2:99 (June), 1949.

Cons as Well as Pros—Though review articles are usually passed over when I thumb the scientific journals in search of papers to be mentioned in this peculiar compendium, our rule is broken in this instance for two very good reasons. The subject (immunization procedures) is close to us all, and this is an especially thorough and balanced presentation. Not to be missed!

EDSALL, G. Active Immunization. *New England J. Med.* 241, 1:18 (July 7), 1949.

Facilities Needed—Among the 2,300 general hospital service areas in the United States, a quarter have no acceptable beds: about 10 million people get along without them. Needs are as great for mental and tuberculous and chronic patients. This is a report of progress—great progress—but there is still plenty to do. We need, among other things, 1,853 more health centers and 1,386 auxiliary facilities, it says here.

HOGE, V. M. Hospital Survey and Construction Program. *Pub. Health Rep.* 64, 32:991 (Aug. 12), 1949.

Letter to Horace, and Other Poems—If it were to be judged solely on its practical value as an addition to your scientific armamentarium, there is a question if this paper should be included in our untrustworthy guide for the preoccupied. But three poems that you'll want to repeat are offered to you. Also the paper is highly readable. Incidentally, it is about the growing problem of the aged and chronically ill.

KLUMPP, T. G. Old Age. *New York State J. Med.* 49, 16:1929 (Aug. 15), 1949.

Solid Researching — Measles virus grown on eggs caused mild symptoms of measles in many—not most—vaccinated children, but whatever protection was afforded was minimal, these researchers report. Clearly, we've still a long way to go along this road.

MARIS, E. P., *et al.* Vaccination of Children with Various Chorioallantoic Passages of Measles Virus. *Pediatrics* 4, 1:1 (July), 1949.

Wise Words of Warning—Industrial health is the people's health so it is a part of the health official's responsibility to his community, but industrial hygiene, like the married state, is not something to be entered into lightly. It calls for a specialized service.

INGRAM, W. T. Industrial Sanitation in a Municipal Health Program. *Modern Sanitation* 1, 4:27 (Aug.), 1949.

They Don't Know or Don't Care —Nearly half the Toronto school kids get each day, a cup of milk, plenty of meat and potatoes, sometimes another vegetable, bread, a piece of pie, one or more pieces of cake, a bottle of soft drink, and lots of candy. Of course, in your town things are different! Or are they?

MCHENRY, E. W. Confusion and Stupidity in Nutrition Education. *Canad. Pub. Health J.* 40, 6:270 (June), 1949.

Bitter with the Sweet—Gloomy reading indeed is this examination of the lack of any decline during the last 20 years in death rates of cancer of the breast. No support is found here for our loud claims that early treatment saves lives, says this analyst.

MCKINNON, M. E. Breast Cancer Mortality, Ontario, 1909–1947. *Canad. Pub. Health J.* 40, 6:257 (June), 1949.

Not Solely Engineering—The stage is set for a nation-covering effort to conserve our priceless water resources. Though it may be only a small one, there is a role for you in the drama that will be played on that stage.

POND, M. A. Water Resources and the Nation's Health. *Pub. Health Rep.* 64, 28:885 (July 15), 1949.

Still Far To Go — Against the astonishing progress in tuberculosis case finding are balanced disheartening lacks in treatment and rehabilitation facilities. So says this editorial commemorating the fifth anniversary of the nation-wide tuberculosis program. Be sure to read it.

SCHEELE, L. A. The First Five Years. *Pub. Health Rep.* 64, 26:817 (July 1), 1949.

It's a Public Health Problem, They Agree—The lions and the lambs (mostly Canadian varieties) sit up together on the same platform and discuss with surprisingly little heat the possibilities of working out a comprehensive medical service. This must be read to be believed!

SINAI, N., *et al.* Panel Discussion on Medical Care. *Canad. Pub. Health J.* 40. 6:241 (June), 1949.

Lest the Pendulum Swing Too Far —It seems this man just can't write uninterestingly. Some who read "Baby and Child Care" may have assumed that that best of baby books was an inspired flash-in-the-pan. But since then we've had a continuing stream of highly readable papers. The latest is about the possibilities of going to foolish extremes in the new philosophy of flexibility in child care.

SPOCK, B. Chronic Resistance to Sleep in Infancy. *Pediatrics* 4, 1:89 (July), 1949.

Ptah-hotep and Walt Whitman—Don't you like, just once in a while to get away from "calculating profits—so much gain from so much reading" (stolen from Elizabeth Browning), and read a paper just for the fun of seeing how someone else does the trick of writing? If you do, this is your dish—garnished with some new quotations.

ZEMAN, F. D. The Medical Significance of Our Aging Population. *Pub. Health Nurs.* 41, 7:381 (July), 1949.

Public Health in Foreign Periodicals

GEORGE ROSEN, M.D., PH.D.

IN her recently published volume, Margaret Bourke-White characterizes India as "halfway to freedom."[1] This description is particularly apt in the area of public health. As a civilization India is very old, but as a nation India is very young. To understand this awakening of the Indian nation is the key to an understanding of the varied aspects of Indian life, including that of health.

Until very recently public health has been a step-child of government in India.[2] Since the war and the acquisition of independence, however, there has occurred an intensification of interest in public health and the prevention of disease. It is in this connection that Miss Bourke-White's phrase is seen to be particularly apposite.

In various ways the situation in India represents a type of accelerated development. On the one hand, the problems that face Indian public health workers are similar to those in Western Europe at the onset of the Industrial Revolution; on the other, the means to deal with these problems are based on advanced scientific knowledge.

These facets are clearly revealed by examining a journal such as *People's Health* edited by A. V. Raman and published monthly at Madras. The purpose of this magazine is "to educate the lay public and the experts alike on all matters pertaining to the health of the people." In this respect it may be described as primarily a propaganda magazine, not unlike the *Journal of Public Health* published by Southwood Smith and his coworkers in the British public health movement of a century ago.

ENVIRONMENTAL HYGIENE

Considerable attention is being paid to environmental sanitation. In 1948, Rajkumari Amrit Kaur, Minister of Health for India appointed an Environmental Hygiene Committee.[3] The terms of reference for this committee were:

1. Investigation of the whole field of Environmental Hygiene with special reference to: (a) town and village planning; (b) housing, urban and rural; (c) water supply; (d) general sanitation, including conservation and drainage; (e) prevention of river and beach pollution; (f) control of insect vectors of disease; and (g) regulation of certain trades, industries, and occupations dangerous to health and offensive to the community.

2. The framing of a program of development for the consideration of the government.

In framing the program, it was recommended that the committee take into account the need for training an adequate number of technical personnel of various categories needed to carry out a modern program of environmental improvement. Furthermore, attention was called to the need for adequate financing, and to the varying resources of the Provinces which would have to be taken into account so that the program which is finally decided upon can be implemented on as uniform a basis as possible.

SECOND HEALTH MINISTERS' CONFERENCE

The major health problems of India may also be seen from the resolutions passed at the Second Health Ministers' Conference held at New Delhi on August 2, 1948.[4] Besides recommending the firm establishment of administrative coöperation between the central, provincial, and state agencies, the

Conference also concerned itself with industrial health, nutrition, tuberculosis, leprosy, the training of medical, nursing, and ancillary personnel, the establishment of an all-India medical register, rural medical aid, malaria control, improvement of the machinery for the registration of vital statistics, blindness in India, and finally health measures for refugees.

The Ministers recognized the importance of nutrition and at the same time the vastness of the Indian problem. They recommended that nutrition committees be set up by various governmental units and that these committees formulate and implement nutrition programs for the respective political and geographic units. Nutrition units should be considered integral parts of health departments, their main functions to determine the nature and extent of the nutrition problems in local areas as well as among specific groups in the population.

Emphasis was also placed on community feeding programs, particularly on the development of school feeding programs, the extension and improvement of factory canteens, and the utilization of maternity and child welfare centers for supplying supplementary food to pregnant women, nursing mothers, and children.

Education in nutrition should also be an important activity of health departments on all governmental levels.

The Conference recognized the magnitude, urgency, and importance of the leprosy problem in India, and recommended the adoption of the following measures:

1. The creation of provincial leprosy organizations to deal with the preventive and curative aspects of the problem;
2. The establishment of institutions for lepers;
3. The control of leprosy in groups of villages, especially those with high endemicity. Here emphasis is to be placed on the protection of children who constantly are exposed to infection;
4. The development of sound graduate and undergraduate training in leprology;
5. Organization of social assistance and welfare services for lepers, as well as the development of rehabilitation for persons who are crippled by the disease;
6. The employment of health education materials on a large scale;
7. To stimulate voluntary efforts in support of the official program.

Another grave problem to which attention was given was tuberculosis. In dealing with this subject, the development of a BCG vaccination program was recommended as an important part of the antituberculosis campaign.

In this brief review it is manifestly impossible to deal with each of the subjects dealt with at the Conference, but it is worth noting the progressive spirit with which they are considered.

BCG VACCINATION

The immensity of the tuberculosis problem in India may be gauged by the fact that there are approximately 500,000 deaths and 2,000,000 cases per year. In view of the manifold health problems with which it must deal, the Indian Government undertook to use BCG vaccination as one of the measures in its antituberculosis campaign. This action has aroused considerable controversy, especially on the part of those who insist that action be taken first to improve social and economic conditions.[5]

HOUSING THE MASSES

There is no denying that India has many other important problems. Next perhaps only to food, is the housing shortage.[6] One solution which has been suggested is prefabrication, but opinion seems to be sharply divided concerning suitability for Indian conditions. At any rate, it is understood that the government of India has agreed to a scheme for the manufacture of prefabricated houses, and a plant is soon

to be erected near Delhi for this purpose.[7]

INCREASED FOOD PRODUCTION

Another subject of intense topical interest is how to increase food production.[8] Sivaraman calls attention to the significance and interplay of various factors such as soils, manures, cultural practices, water supply, climatic conditions, pests, diseases and other environmental factors. The use of compost as manure is being actively discussed.[9, 10]

HEALTH EDUCATION

Mention has already been made of suggested educational measures in connection with specific problems such as leprosy. There is a clear recognition, however, of the need for a general public health education program. It is urged that proper steps be taken to insure a suitable school health education program, while at the same time similar proposals are put forth in the interests of adults.[11, 12]

MEDICAL AND DENTAL EDUCATION

Serious efforts are also being made to raise the standards of medical and dental education. As part of this endeavor one finds numerous articles calling attention to flaws and suggesting ways to remedy them.[13, 14]

PHYSICAL DEVELOPMENT OF JAPANESE CHILDREN

An interesting contrast to India is provided by the contributions contained in the *Japanese Medical Journal* which first appeared in April, 1948. Saito and Kawakami report on the recent physical development of Japanese children.[15] The authors state that during the war the height and weight development of urban school children was markedly disturbed, while rural children showed no effects. This difference is explained as due to better nutrition in the rural areas.

TREATMENT OF WHOOPING COUGH

Yaoi and Tagaya offer an interesting account of the use of *Hemophilus pertussis* vaccine combined with purified vaccinia lymph in handling epidemics of whooping cough. The vaccinia lymph is alleged to enhance the activity of the vaccine.[16]

INTRAPERITONEAL INOCULATION OF BCG VACCINE IN INFANTS

BCG vaccine has recently become popular in Japan. Yamaoka and Okayasu undertook the intraperitoneal inoculation of 125 infants and young children with the vaccine.[17] The subjects ranged in age from 1 month to over 2 years, but the majority were from 4 to 12 months of age.

The BCG vaccine was diluted with 5 ml. Ringers solution or 5 per cent glucose solution, and injected intraperitoneally. The minimum dose was 0.015 mg., the maximum 0.13 mg.; most of the children received 0.05 mg. (45 cases) and 0.1 mg. (50 cases).

Negative reactions changed to positive in 84.6 per cent of the cases in the 5th week and 100 per cent in the 7th week. The Mantoux local reaction was usually marked, showing, except in several atrophic infants, a well demarcated erythematous area with definite induration. Follow-up observation revealed no untoward effects. The authors conclude that the intraperitoneal inoculation of BCG vaccine is as effective as by other methods, and because of the ease of administration is especially indicated in infants. As to this conclusion, I am sure opinions will differ.

A NEW SALMONELLA TYPE

Hayakawa and Sen[18] report the finding of a new Salmonella type (*S. singapore*), isolated from a case of enteritis in Singapore. Its antigenic structure is VI. VII: K-enx, and shows marked phase dissociation.

IMMUNITY AGAINST DENGUE

Yaoi and Arakawa summarize their studies on dengue.[19] They report that they were able to give protection against dengue to human beings by means of an attenuated mouse virus. More than a month seemed to be necessary for the immunity to reach its maximum.

Ishii also reports successful results in producing immunity against dengue.[20] He used a formalized mouse virus vaccine. The length of immunity is said to be about 3 months.

It should be noted, of course, that Sabin and Schlesinger in 1945 had found virus modified by propagation in mice effective in producing immunity to dengue.

Treasurer: N. W. Pickett, City Health Dept., Salt Lake City

Cuban Public Health Society—

President: Juan A. Cosculluela
1st Vice-President: Alberto Recio, M.D
2nd Vice-President: Pedro Nogueira, M.D.
3rd Vice-President: Juan A Roman, M D
Technical Director: Guillermo Lage, M D.
Sub-Technical Director: Pedro Gonzales, M D
Technical Secretary: Rafael Calvo, M.D
Vice-Technical Secretary: Aristides Fernandez M D

LAWRENCE M. FISHER APPOINTED ENGINEERING FIELD ASSOCIATE ON A. P. H. A. STAFF

The Executive Board of the American Public Health Association has appointed Lawrence M. Fisher of Garrett Park, Md., as Engineering Field Associate.

Mr. Fisher will conduct the program of the Engineering Section Project, a special activity of the Association commenced in 1946. The goal of the Project is to develop better administrative and personnel practices in the field of environmental sanitation. Other activities of the Project include stimulation of the use and study of the Association Sanitation Evaluation Schedules; research work in administrative procedures (see *A.J.P.H.* Sept., 1949, p. 1144); emphasis on the use of an adequate number of properly qualified engineers and sanitarians; development of academic training fitted to the needs of environmental sanitation workers; and recruitment of new personnel.

Mr. Fisher retired recently from the U. S. Public Health Service as Sanitary Engineer Director after more than 30 years of service. His public health career commenced in 1912 when he was associated with Victor G. Heiser, M.D., in Manila doing special work in the hygiene of housing. His duties with the Service included extra-cantonment work during World War I; direction of malaria control work in South Carolina, including a period as Acting State Sanitary Engineer; District Engineer in New York, Washington, and Chicago; and direction of shellfish sanitation. Most recently he was assigned to the Office of the Surgeon General where he served as a member of the Interstate Commission on the Potomac River Basin by Presidential appointment, and as Chairman of a Technical Advisory Board to the International Joint Commission. He has been a Fellow of the Association since 1927, and for several years was Chairman of the Engineering Section Committee on Shellfish Sanitation. He is the author of numerous technical papers and developed a *Manual of Recommended Practice on Shellfish Sanitation* for the shellfish industry. He holds a degree of B.S. in Sanitary Engineering and a C.E. degree from Pennsylvania State College and a D.P.H. from the University of Georgia.

LAWRENCE M. FISHER

TELLERS APPOINTED

In accordance with Article VII, Section 8, of the A.P.H.A. By-laws, providing for the appointment of Tellers by the President of the Association, Dr. Wilinsky has appointed the following Tellers to canvass the vote of the Fellowship on elective members of the Governing Council:

Chairman, Richard F. Boyd, M.D.
Leonard Greenburg, M.D.
Bosse B. Randle, R.N.

The Tellers met in New York City on October 4 and tabulated the returns on the first mail vote for ten elective Governing Councilors. They will report the results of the vote to the Governing Council at its meeting on October 24.

INDUSTRIAL HYGIENE SECTION APPOINTMENT

William G. Fredrick, Sc.D., Chairman, Industrial Hygiene Section, announces the appointment of H. F. Schulte, University of California, Box 1663, Los Alamos, N. M., as interim secretary for the Section. This appointment became necessary due to the resignation of Richard T. Page because of ill health..

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

Robert McColl Aldis, M.D., D.P.H., Huron County Health Unit, Clinton, Ontario, Canada, Medical Officer of Health

Alfred J. Aselmeyer, M.D., 120 Boylston St., FSA, Region I, Boston 16, Mass., Regional Medical Director, Federal Security Agency

Edward T. Blomquist, M.D., M.P.H., 2500 Que St., N.W., Washington, D. C., Asst. Chief, Division of Tuberculosis, P.H.S., Federal Security Agency.

Iwan Guicherit, M.D., M.P.H., Surinam Bauxite Co., Paramaribo, Surinam, Dutch Guiana, S. A., Medical Director, Moengo Hospital

Robert T. Hyde, M.D., P.O.B. 665, Atlantic Beach, Fla., Radiologist, Bureau of Tuberculosis Control, Florida State Board of Health, Acting in the capacity of Health Officer

Webster M. Moriarta, M.D., 61 Maple Ave., Saratoga Springs, N. Y., Health Officer, City of Saratoga Springs

Frank W. Mount, M.D., 132 Crane Ave., Royal Oak, Mich., Apprentice Epidemiologist, training, New York State Dept. of Health

Pierce D. Nelson, M.D., M.P.H., 3227 Atwood Ave., Madison 4, Wis., District Health Officer, State Dept. of Health

Lt. Col. James P. Pappas, M.C., Surgeon, Hdqs., Fort Devens, Mass.

Earl A. Rogers, M.D., M.P.H., 1635 S. 26th St., Lincoln 2, Neb., Director, Division of Tuberculosis Control, State Dept. of Health

Walter W. Seibly, M.D., 842 5th St., Clarkston, Wash., Asotin County Physician and Surgeon

James L. Wardlaw, M.D., Madison County Health Dept., Madison, Fla., Director, Madison-Taylor Health Dept.

Laboratory Section

Kenneth E. Anderson, Ph.D., St. Bonaventure College, St. Bonaventure, N. Y., Head, Dept. of Biology

Vern Bolin, M.S., Univ. of Utah, Dept. of Pediatrics, Salt Lake City, Utah, Research Assoc., School of Medicine

Hilfred N. Bossak, B.S., U. S. Marine Hospital, V.D. Research Laboratory, Staten Island 4, N. Y., Serologist, P.H.S., Federal Security Agency

Dan C. Dickinson, 1920 Marengo St., Los Angeles, Calif., Laboratory Instructor, California College of Mortuary Science

Julia M. Flynt, B.S., 5166 Covington Road, Rt. 2, Decatur, Ga., Laboratory Technician, Georgia Dept. of Public Health

Onofre Garcia, M.D., Quezon Institute, Quezon City, Manila, Philippines, Pathologist

Lee E. Gordon, M.S., Ohio State Univ., Dept. of Bacteriology, Columbus 10, Ohio, Instructor

Fordyce R. Heilman, M.D., Ph.D., Mayo Clinic, Rochester, Minn., Consulting Physician and Head of Section on Bacteriology

Brigida Herrnstadt, B.A., Apartado Aereo 4707, Bogota, Colombia, S. A.

Marian B. Pierce, 2007 Wilshire Blvd., Los

Angeles 5,, Calif., Bacteriologist and Co-director, L. F. Pierce Laboratories

Donald E. Shay, Ph.D., 32 S. Green St., Baltimore 1, Md., Professor and Head, Dept. of Bacteriology, Univ. of Maryland

Frederick D. Sisler, Ph.D., Scripps Institution of Oceanography, La Jolla, Calif., Research Assoc.

John W. Spanyer, Jr., M.S., 1908 Howard St., Louisville, Ky., Asst. Technical Director, Brown-Forman Distillers Corp.

Diego B. Gonzalez-Teran, M.D., Frontera 22, Mexico, D.F., Mexico, Bacteriologist, Laboratorio Medico

Fanny B. Warnock, 4916 West Huron St., Chicago 44, Ill., Head, Dept. of Bacteriology, Norwegian American Hospital

Joseph W. Whalen, 1037 West Michigan, Battle Creek, Mich., Bacteriologist and Biochemist, Arthur S. Kimball Sanatorium and Calhoun County Health Dept.

Vital Statistics Section

Mary M. Coston, 967 Juniper St., N.E., Atlanta 5, Ga., Supervisor, Statistical Clerical Unit, Communicable Disease Center, P.H.S., Federal Security Agency

Vivian P. Dubinick, P.O.B. 901, Juneau, Alaska, Chief, Records and Statistics, Bureau of Vital Statistics, Alaska Dept. of Health

R. L. Ellis, Box 2124, Miami Beach 40, Fla., Interested Citizen

Leonard W. Hole, 1276 Richardson St., Victoria, B.C., Canada, Statistician, Division of Vital Statistics, British Columbia Government.

Carl E. Hopkins, Ph.D., Univ. of Oregon, Medical School, Portland, Ore., Assoc. Professor of Public Health and Preventive Medicine

Evelyn O. Keener, P. O. Box 229, Columbus, Ga., Secy., Dept. of Health

Stanley W. Laird, 5070 Wise Way, Chamblee, Ga., Survey Statistician, Communicable Disease Center, P.H.S., Federal Security Agency

Margaret F. McKiever, 6500 Luzon Ave., N.W., Washington, D. C., Statistician (Biometrician), P.H.S., Federal Security Agency

Dorothy E. Rogers, Reporting and Analysis Section, Division of Tuberculosis, P.H.S., Federal Security Agency, Washington, D. C., Health Program Specialist

M. Loyola Voelker, 5642 Abner Ave., C., Baltimore, Md., Director, Medical Record Library, U. S. Marine Hospital

Engineering Section

Henry W. Harper, III, D.V.M., 2801 S. Dort Highway, Flint, Mich., Veterinarian, Flint Health Dept.

John H. McCutchen, 606 Dix Road, Jefferson City, Mo., Supervisor, Bureau of Food and Drugs, Dept. of Health and Welfare

Robert M. Reese, 1523 N. 16th St., Philadelphia 21, Pa., Director, Sanitation Division, Alex. C. Fergusson Co.

Ellis A. Tarlton, M.S., 34 Pleasant St., Danbury, Conn., City Chemist, Danbury Water Dept.

L. O. Williams, M.S., 1901 Cheyenne Place, Cheyenne, Wyo., Director, Division of Public Health Engineering and Sanitation, State Dept. of Public Health

Industrial Hygiene Section

Ronald F. Buchan, M.D., C.M., 213 Washington St., Newark, N. J., Director, Employee Health, Prudential Insurance Company of America

Lloyd D. Utter, 1353 Columbia Rd., Berkeley, Mich., Director, Industrial Health and Safety Division, Social Security Dept., UAW-CIO

Food and Nutrition Section

Marjorie Cantoni, 1357 Washington St., Nutrition Center, West Newton 65, Mass., Nutritionist-in-charge, Newton Nutrition Center

Dora M. Dabney, M.S., 83 E. Xenia St., Jamestown, Ohio, Nutrition Consultant, Ohio Dept. of Health

Minna L. Gutsch, M.S., Wisconsin State Board of Health, Madison, Wis., Nutritionist

Trandailer Jones, B-14 Bourne Field, Charlotte Amalie, Virgin Islands, Nutritionist, Dept. of Health

Edwin Ludewig, 840 Grand Concourse, New York, N. Y., Director, Bureau of Foods and Drugs, New York City Health Dept.

Eleanor A. Matsumoto, 1727 Apaki St., Honolulu 17, Hawaii, Nutritionist, Dept. of Health

Wilma F. Robinson, 222 South 4th St., Springfield, Ill., Consultant Dietitian, Illinois Dept. of Public Health

Wallace R. Roy, Ph.D., Vacuum Foods Corp., Plymouth, Fla., Chief Chemist

Theresa McDuffie Samuels, M.A., 1931½ Highland Place, Indianapolis, Ind., Public Health Nutritionist, Herman G. Morgan Health Center

Marjorie L. Scott, M.Sc., 1201 Connecticut Ave., N.W., Washington, D. C., Nutrition Officer, Nutrition Division, United Nations Food and Agriculture Organization

Ardyce I. Sorensen, Box 177, Wailuku, Maui, T. Hawaii, Nutritionist and Executive Secretary, Maui County Tuberculosis Assn.

Sarah F. Welsh, 1125 Linden Ave., Baltimore 3, Md., Director of Home Economics Dept., Western Maryland Dairy

Maternal and Child Health Section

Nathan P. Eisenberg, M.D., 133-21 228th St., Laurelton, L. I., N. Y., Medical Inspector, Child Hygiene, New York City Dept. of Health

Lillian Marks, M.D., 1270 Bryden Rd., Columbus, Ohio, Medical Director Services for Crippled Children, Ohio Dept. of Public Welfare

Qualified Professional Man in Division of Sanitary Engineering and Sanitation. Requirements: graduation from accredited four year college or university with bachelor's degree in engineering, physics, chemistry, geology, biology, bacteriology, entomology or parasitology plus two years of experience, one of which must have been in supervisory or administrative capacity. Salary range—$4,000 to $5,020. Write: Merit System Supervisor, Box 939, Santa Fe, N. M.

Public Health Nurses to fill vacancies in Health Department. Generalized Service including maternal and child care, school health, and communicable disease control. Immediate appointment on provisional basis. Salary range $2,520–$2,880. Vacation; sick leave; In-Service Training. Write: Director Public Health Nursing, State Board of Health, State Health Bldg., Little Rock, Ark.

Qualified Sanitarian: for Shelby County, Illinois, serving 26,000 rural population. New position for the improvement of sanitation in newly organized Bicounty Health Unit. Salary, $3,000 plus liberal travel. Write: Fred O. Tonney, M.D., Medical Director, 206 North Morgan St., Shelbyville, Ill.

Public Health Nurse for generalized program in a City-County Health Department. Salary based upon training and experience. Public Health Nurse I, $2,900 and Public Health Nurse II, $3,200, plus travel. Write: Kalamazoo Health Department, Kalamazoo, Mich.

County Health Officers—Recently increased salary plus travel allowance of 7¢ per mile for Medical Directors of our county health units. Several desirable Kentucky counties open. Advancement opportunities plus training program for right men or women. Write: Tracy Jones, M.D., Director, Division of County Health Work, State Department of Health, 620 S. Third St., Louisville 2, Ky.

Assistant Professor of Microbiology interested in parasitology; salary $4,200–$4,400. Midwestern medical school. Position to be filled not later than February 1, 1950. Write: Box: A-71, Employment Service, A.P.H.A.

Qualified Public Health Nurse for generalized program in District Health Department. Liberal salary, adequate travel allowance, vacation, sick leave, and in-service training program. Write: District Health Department, Coldwater, Mich.

A number of part-time positions are open as Dental Operators in the Cincinnati Schools. Minimum salary, $3,954, two weeks' vacation with pay, retirement. Write: Oral Hygiene Services, Fourth and Ludlow Streets, Cincinnati, Ohio

Dental Hygienist for City Health Department. Write: Garland Weidner, M.D., Health Officer, City Health Department, La Crosse, Wis.

Qualified public health nurses having, or eligible for, California registration and certificate in Public Health Nursing. Must own and drive car and be willing to live in city. Generalized public health program. City of 100,000. Salary $265–$311. Send full particulars and recent photograph to: City Manager, Richmond, Calif.

Qualified Public Health Officers. Salary $5,000–$8,000 per year, plus automobile allowance. Merit System rights and privileges; vacation; sick leave; retirement provisions under certain conditions. Write: Dr. George W. Cox, State Health Officer, Austin, Tex.

POSITIONS WANTED

Non-Medical Administrator, interested in health education—Male (Ph.G. 1921). Experienced in organization, administration, public relations, fund raising, epidemic aid, convalescent care at state, regional, and national levels. Available immediately for position in similar capacity with voluntary or private agency. Salary $8,000 to $10,000 depending on location. Prefer West or Southwest. Write: Box HE-14, Employment Service, A.P.H.A.

Bacteriologist—Male; 26; recent M.S. degree, University of Chicago; excellent background in immunology, parasitology, and food bacteriology. Desires position in research; any location. Write: Box L-12, Employment Service, A.P.H.A.

Veterinarian—age 32, experienced in public health food inspection and sanitation control work, desires position with public health agency. Write: Box V-9, Employment Service, A.P.H.A.

Dentist, male, 30 years old, M.P.H.; 5 years' clinical and public health experience (civilian and U. S. Army). Interested in administrative or part-time clinical opening in U. S. or overseas. Write: Box D-4, Employment Service, A.P.H.A.

Nutritionist or Home Economist—15 years' experience as head dietician in hospitals. B.S. degree. Write: Box N-2, Employment Service, A.P.H.A.

Dentist, 1939 graduate, desires clinical or administrative position with health department or school. Appointment anywhere in the United States. Write: Box D-5, Employment Service, A.P.H.A.

Industrial Hygienist—15 years' experience in wide variety of industries. Excellent training in biological and chemical sciences. Familiar with detection and control of common industrial health hazards. Presently employed but seeking position with greater challenge and opportunity. Write: Box I-H-3, Employment Service, A.P.H.A.

Non-Medical Administrator, B.A., M.P.H., age 26, ex-serviceman, single. Presently employed in the field of preventive medicine and familiar with the different aspects of public health. Write: Box C-13, Employment Service, A.P.H.A.

Health Educator, woman, qualified in community and school health education: B.S. and M.A. degrees in Health and Physical Education, plus graduate workshop in Health Education and business school training. Teaching experience includes college and high school health education. Community experience includes voluntary community agency position and coördinator for school-community health program. Interested in school or community health education work. Write: Box HE-15, Employment Service, A.P.H.A.

United States Public Health Service Announces Regular Corps Examinations for Nutritionists

Examinations for Sanitarian Officers (Nutritionist) in the U. S. Public Health Service Regular Commissioned Corps will be held November 14–16 at various points throughout the U. S. Completed applications must be in the Washington Office by October 17.

Appointments are permanent and provide opportunities for career service in hospital nutrition and public health. Benefits include periodic pay raises and promotions; liberal retirement provision; medical care; annual and sick leave.

Appointments will be made in the grade of Senior Assistant Sanitarian (equivalent to Army rank of Captain). Entrance pay is $4,489 (with dependents). Applicants must have a Master's Degree with a major in nutrition from an approved college; approved hospital dietetic internship; 10 years' post-high school training and experience.

For application forms and additional information, write to: Surgeon General, U. S. Public Health Service, Washington 25, D. C., Attention: Division of Commissioned Officers.

All communications should be sent to Burneice Larson, Medical Bureau, Palmolive Building, Chicago 11, Ill.

Opportunities Available

PUBLIC HEALTH PHYSICIANS FOR FOLLOWING: (a) To serve as administrative chief of all public health activities; county population 350,000; headquarters in university and resort city of 185,000; $8,500. (b) To direct university health service; well equipped modern department; student enrollment 4,000, faculty, 250; Middle West. (c) To assist in municipal health department; university town of 150,000; Pacific Coast. (d) To direct health program; public school system; approximately 12,000 elementary pupils; term runs 40 weeks; winter resort town of 165,000; Southwest. (e) To direct division of geriatrics and adult hygiene; metropolitan health department. Minimum $8,500; Midwest. (f) To join staff of national health organization; administrative experience required; $8,000–$10,000; East. (g) Woman physician; student health appointment; young women's college; East. PH10-1 Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

WANTED—(a) Health director; industrial health service; man preferred; tuberculosis experience desirable; East. (b) Sanitary engineer thoroughly experienced in fields of malaria and insect control; key position; South America; $7,000. (c) Nutritionist; university appointment; duties consist of serving as consultant; Middle West. (d) Health educator; association of voluntary health agencies; new development; town of 40,000, New England. (e) Sanitary engineer or sanitarian; duties: to supervise operation of all phases of local or statewide malaria control, rodent control, etc.; West. (f) Health educator and, also, health education consultant; state department of health; interesting opportunities. (g) Sanitary engineers; county health department; $4,000–$4,500; Midwest. PH10-2 Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

PUBLIC HEALTH NURSES FOR FOLLOWING: (a) To direct generalized public health program, county department; headquarters in college town, Northern California; $4,200–$4,800. (b) To direct public health nursing program, eastern university. (c) To supervise program, planned parenthood center, Midwestern metropolis. (d) To direct program, public school system; residential town, 30,000, short distance, university medical center; Middle West. (e) To direct student health service, women's campus, liberal arts college; well staffed department; Middle West. (f) To supervise generalized public health nursing program, children's clinics; California resort town, 25,000, located on Pacific Ocean. (g) College nurse; college preparatory school; resident and day students; university center; East. (h) Staff appointments, state department; headquarters, university medical center; $2,700–$3,900. (i) Industrial hygiene nurse; duties consist of elevating standard of nursing in industry, surveys, serving as consultant; considerable traveling; East. (j) Apprenticeship, public health nursing; salary during training period, $216; city health Department; Widwest. PH10-3 Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Opportunities Wanted

Health educator; Master's degree, Public Health, Eastern university; four years, health educator, county health department; three years, health coordinator, liberal arts college; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Physician distinguished in the field of public health medicine is available; M.S., M.D., D.P.H. degrees, leading schools; enviable career of successful experience in academic and administrative public health work; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public health dentist; D.D.S., M.S.D. (Children's Dentistry), M.P.H. (Public Health); several years, teaching experience; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public health nurse is available for executive position; B.S. in Public Health nursing; M.A. in Administration; ED.D. Nursing Education; seven years, teaching her specialty; four years, public health nursing administration; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public health nurse administrator; A.B., M.P.H., Minnesota; several years, school nurse; five years, supervisor, county health department; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Sanitary engineer; B.S., Civil Engineering; several years, sanitary engineer, tropics; past four years, chief, engineering division, county department of health; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

NEWS FROM THE FIELD

COURT HOLDS UNITED STATES RESPONSIBLE IN TYPHUS DEATH

The Federal District Court in Baltimore was ordered on August 2 by the United States Court of Appeals in Richmond, Va., to assess damages against the United States Government for the death from endemic typhus fever of a tenant in a Baltimore defense housing project which had been operated by the Federal Public Housing Authority.

According to the press, in an opinion which reversed the trial court in part, the U. S. Court of Appeals ruled that the tenant had died January 23, 1947, from the bite of a flea in a rat-infested dwelling which the Housing Authority should have cleaned up. According to the appeals court opinion the evidence established conclusively that the field supervisor of the Public Housing Authority who inspected the premises monthly was notified in November, 1946, not merely of the danger of rat infestation in general but also of the presence of endemic typhus on the premises and of the particular role which rats play in spreading the disease. According to the decision, the United States failed to act in spite of the foreknowledge of the very danger which ultimately resulted in the death of the tenant.

The suit was brought by the State of Maryland on behalf of the widow of the tenant against the owners and operators, including the Federal Public Housing Authority. The house in which the tenant lived was one of 22 three-story row buildings, 125 years old, located in the 600 and 700 blocks of North Calvert Street in Baltimore. These were rented in June, 1943, by the Federal Public Housing Authority for a nominal rental to aid in the pressing need for housing for defense workers. Each of the houses was divided into six apartments and the total of 96 dwelling units actually housed as many as 328 persons who had access to the basements or cellars where they did their laundry and deposited their garbage.

According to the opinion, during the period of government control, the wooden floors of the cellars were honeycombed with rat burrows and the garbage from the apartments frequently overflowed the dilapidated, uncovered containers furnished by the landlord to the tenants and spilled upon the floor. The Baltimore City Health authorities warned the government of the condition of the apartments March 15, 1944, but more than two years elapsed before steps were taken to fill the rat holes and dust the burrows with DDT. The opinion said that the work was done in an unsatisfactory manner, despite prodding from the City Health Department, with the result that the rats still had harborage in the floors and walls. A total of 6 cases of typhus was reported at the City Health Department from this apartment house area prior to January 1, 1947, and the government sub-leased the premises on that date, which action freed the City Health Department to take charge of the situation. On January 20, 1947, a detailed directive outlining the necessary steps for effective ratproofing was issued and the work was done in about two months, since which time no cases of typhus fever have been reported from the area.

This is believed to be the first time that a housing authority has been held responsible for a disease caused by deficient environmental sanitation. It is expected that the decision will be appealed to the United States Supreme Court by the Federal Public Housing

Authority. The final decision will affect, to a considerable extent, the authority which local health departments have in the control of environmental sanitation.

MASSACHUSETTS HEALTH UNIT LAW

Governor Dever recently signed the Union Health Bill which enables the towns and cities of Massachusetts to form union health departments. The Act provides that two or more cities or towns may form a union health department to be administered by a full-time director of health who must be either a physician registered or eligible for registration to practise medicine in the Commonwealth, or a lay person with specialized training and experience in public health. The State Health Department sets minimum qualifications for union health department directors and passes upon the qualifications of each candidate for appointment to such position.

The law further provides that if within ten years municipalities having a population of less than 35,000 do not voluntarily become members of health unions, the State Department of Public Health shall, after a public hearing, include such municipalities in existing or new unions, unless such communities are providing minimum health services as defined by the State Public Health Council. No constituent city or town of a health union may withdraw from a union until it has been a member for at least five years, nor without provision for its inclusion, subject to the approval of the State Health Department, in a separate or another union.

"This is, without doubt, the most important health legislation that has been passed since the establishment of the State Department of Public Health in 1869," commented Vlado A. Getting, M.D., Commissioner of Public Health, on passage of this law. He said further that the law opens the door for the people of Massachusetts to have the public health protection which is their right; small rural communities can have the same advantages already provided in the larger cities. Services such as immunization of preschool children, well child conferences, prenatal advice to mothers, inspection of private water supplies and sewage disposal, chest x-rays, and prevention against the spread of communicable diseases can reach every home in the Commonwealth.

KENTUCKY CONTRIBUTES TO PUBLIC HEALTH LAW

On December 17, 1948, the highest court of Kentucky, the Court of Appeals, handed down three decisions of considerable significance to public health administration in that state and elsewhere. One of these, Louisville and Jefferson County Board of Health v. Steinfeld, 215 S.W.2d 1011, is also of special interest to members of the American Public Health Association, since it upholds the right of a city-county board of health to reimburse one of its executives for expenses incurred in attending a meeting of the Southern Branch of the Association outside the state. Although the Kentucky statutes contain no specific authorization for the payment of such convention expenses, the Court stated that this power arises from necessary implication in the health laws, particularly those sections providing for research, and the gathering of statistics and information which is useful in the performance of official duties. This court sagely pointed out that it is a matter of common knowledge that hearing an eminent specialist lecture, engaging him in conversation thereafter, and seeing him demonstrate his theories is much more enlightening than reading about it in a journal.

In the second case, Nichols, et al., v. Marks, et al., 215 S.W.2d 1000, it was held that a county health officer in Kentucky is not an officer but an employee, and thus may receive a salary in excess of $5,000 a year, the limit placed upon

the salaries of public officers by the state constitution. The county health officer is an employee because he is appointed by a board, reports to it, and is supervised by it, whereas a position is a public office only when it is created by law, is of a continuing nature, and involves some exercise of the sovereign power of the state. In a dissenting opinion the Chief Justice ironically remarked that it will not be long before Kentucky has a dearth of officers and a plethora of employees if the court continues to circumvent the state constitution in this respect.

The third case, Mosier v. Barren County Board of Health, 215 S.W.2d 967, sustains the right of a board of health to promulgate and enforce rules for the compulsory vaccination of all school children. The regulation was contested by two chiropractors who claimed, among other things, that their religious and conscientious beliefs were opposed to vaccination against smallpox. The Court curtly dismissed this contention with the statement that the law does not permit religious beliefs to jeopardize the lives, safety, or health of the general public.

SYPHILIS CASE FINDING PROGRAM

Twenty-eight of the 48 states, representing two-thirds of the country's population, have joined with the U. S. Public Health Service in an intensive campaign to find and treat the 1,000,000 persons who "have syphilis and don't know it." June was devoted to ground work; July and August to the effort to discover and treat every case of syphilis in the more than 200 communities participating in the program. State and local health departments, voluntary groups, civic organizations, and medical societies have joined in the all out drive.

The Public Health Service provided funds and technical assistance to local health departments for the campaign, while the departments themselves worked out their own local patterns of activity. Surgeon General Leonard A. Scheele of the Service expressed the hope that the effort would not be limited to the 28 states and the months of July and August, but that successful work in some communities would inspire others until "an unbroken chain of states, cities, and towns is dedicated to the elimination of syphilis as a leading cause of sickness, and disability in the United States."

The campaigns are being conducted along the lines of the pilot studies made in Washington, D. C., and New York City (*A.J.P.H.* 39, 2:276 (Feb.), 1949), in 1948.

CENTRAL AMERICAN NUTRITION INSTITUTE

On September 15 in Guatemala City were held inauguration ceremonies of the Nutrition Institute of Central America and Panama. The agreement to organize the Institute as a center for scientific studies of human nutrition coördinated with field investigation, was signed by all Central American countries and Panama, at a meeting called by the Pan American Sanitary Bureau in February, 1949. El Salvador, Guatemala, and Honduras have ratified the agreement and are contributing funds for the Institute; Costa Rica, Nicaragua, and Panama are expected to ratify.

The agencies involved in this coöperative effort are the departments of health and agriculture of the participating countries; the Pan American Sanitary Bureau, chief of whose Nutrition Section, Dr. Nevin S. Scrimshaw, is director of the new Institute; the W. K. Kellogg Foundation which has provided scholarships for training agronomists and other personnel from each participating country and also funds for technical and administrative direction and for laboratory equipment; the Rockefeller Foundation, which is training agronomists in Mexico; the department of food technology of the Massachusetts Institute of

Technology which helped to plan the Institute and to train fellows.

The Ministry of Health of Guatemala has provided the headquarters building for the Institute, located in Guatemala City.

NATIONAL CONFERENCE OF SOCIAL WORK ELECTS OFFICERS

At the 76th Annual Meeting of the National Conference of Social Work held in Cleveland, Ohio, the week of June 12, Martha M. Eliot, M.D., Associate Director-General, World Health Organization, Geneva, Switzerland, formerly Associate Chief of the U. S. Children's Bureau, was elected President of the 1950 Conference. Lester B. Granger, Executive Secretary of the National Urban League, New York, was elected first Vice-President. Joe R. Hoffer is the Executive Secretary of the Conference. The Cleveland meeting was under the Presidency of Ralph H. Blanchard, Executive Director of Community Chests and Councils of America, New York.

WESTERN BRANCH MERIT SYSTEM SERVICE RESOLUTION

At the annual meeting of the Western Branch, A.P.H.A., in Los Angeles in May, the following resolution commending the Association's Merit System Service was adopted by the membership:

WHEREAS, the American Public Health Association has established a Merit System Service which has been used by many local organizations and is available to many more, Therefore, be it

RESOLVED: That the members of the Western Branch commend the American Public Health Association for its foresight in establishing this service and urge the extension of its use.

NEW YORK CITY POLIO DIVISION

The City of New York Department of Health, "as part of definite plans to strengthen facilities for handling the problem of poliomyelitis," has created a division of poliomyelitis in the Bureau of Preventable Diseases and revived the department's technical advisory committee on poliomyelitis. All epidemiological work of the department on poliomyelitis will be centralized in the newly created division headed by Morris Siegel, M.D., who has been a member of the department since 1935.

ARTHRITIS ADVISORY GROUP

As the first step in an intensified nation-wide research program to find practical ways for combating rheumatic diseases, an advisory group of nationally known physicians and medical scientists, to the Public Health Service has been appointed, to be known as the Arthritis and Rheumatism Study Section of the National Institutes of Health.

One of the functions of the study section will be to explore the recently discovered possibilities of two substances, cortisone, popularly known as Compound E, and ACTH (adrenocorticotrophic hormone), which have been found to alleviate symptoms of patients suffering from rheumatoid arthritis. The group is headed by Phillip Hench, M.D., of the Mayo Clinic, Rochester, Minn. He and E. C. Kendall, M.D., headed a Mayo Clinic group which first investigated the two compounds. Their findings were recently made known.

In addition to Dr. Hench members of the new group are:

Walter Bauer, M.D., Massachusetts General Hospital

Granville Bennett, M.D., University of Illinois School of Medicine

Jerome W. Conn, M.D., University of Michigan

W. Paul Holbrook, M.D., Tucson, Ariz.

Robert Loeb, M.D., Columbia University College of Physicians and Surgeons

KENTUCKY REORGANIZES

Under a reorganization recently put into effect, the 19 divisions of the Kentucky State Health Department have been grouped into four main sections. They are:

Local Health Services which includes the divisions of county health work, maternal and

child health, public health nursing, dental health and mental health

Preventive Medical Services which includes epidemiology, tuberculosis control, venereal disease control, trachoma and blindness, and cancer control

Environmental Sanitation Services which includes sanitary engineering, food, drugs, and hotels, and industrial health

Central Administration Services which includes administration, budgets and accounts, vital statistics, bacteriology and laboratory services, public health education, and medical, hospital and related services

The July, 1949 issue of the *Bulletin* of the Kentucky Health Departments contains the organization chart that reflects the current administrative setup.

LILLY AWARD TO DR. KLOTZ

The 1949 Eli Lilly and Company Award in biological chemistry was presented to Irving M. Klotz, Ph.D., associate professor of chemistry, Northwestern University, at the annual meeting of the American Chemistry Society in Atlantic City in September. The award cites Dr. Klotz for his service in several phases of protein chemistry.

AFGHANISTAN RECEIVES WHO HELP

On July 22, the Pan American Sanitary Bureau, as the Western hemisphere regional office of WHO, was asked for help in combating an epidemic of louse-borne typhus in Afghanistan. Within a few days quantities of DDT were shipped to that country for dusting the area to destroy the disease-bearing lice.

ABSTRACTING IODINE LITERATURE

Iodine Abstracts and Reviews is a new bi-monthly periodical, published by the Iodine Fellowship at the Mellon Institute, Pittsburgh. The first issue appeared in July, 1949. It provides summaries of scientific and technical literature relating to the uses of iodine and its compounds in chemistry and in the industries. From time to time it will present reviews of specific phases of the science and technology of iodine. Complimentary subscriptions may be secured from the Iodine Educational Bureau, Inc., 120 Broadway, New York 5, N. Y.

NEWS OF ALASKA

The second marine unit of the Alaska Department of Health, the Yukon, has been in operation on the Yukon River during the summer. Designed like its sister barge, Hygiene and Health, it carries general public health to isolated areas. A physician, dentist, dental assistant, public health nurse, laboratory x-ray technician, and clerk make up its professional staff.

The Alaska Department of Health and its Commissioner recently met with the Armed Forces Disciplinary Control Board at the latter's request to discuss the inadequate regulations and enforcement efforts regarding the sale of liquor and the suppression of prostitution. They agreed that venereal diseases cannot be controlled without the complete suppression of prostitution, and that enforcement machinery of Territorial laws about dispensing liquor are inadequate and called upon the local community to accept its responsibility in these matters.

AMERICAN RED CROSS NEWS

Home Nursing Program on Guam—An American Red Cross program of home nursing and hygiene was recently set up in Guam at the request of the Guam Public Health Department. The assistant national director of home nursing, Ellen Aird, recently spent two months in Guam organizing the program, teaching non-nurse instructors, and completing 8 classes in home nursing and starting 8 others.

Foreign Study Visitors—Two Norwegian Red Cross Nurse leaders, both directors of nursing schools in Norway, recently completed a year's scholarship

visit in the United States under the auspices of the American Red Cross. They were studying primarily nursing curriculum, educational methods, nursing service, and hospital construction and management.

An Iraq child welfare clinic nurse, representing also the Iraq Red Crescent Society, recently arrived for a 6 months' fellowship to study the nursing services of the American Red Cross, particularly in relation to maternal and child welfare.

American Red Cross Nursing Services is off the press. Designed for nurses to inform them of Red Cross nursing activities and to encourage their participation, the booklet is said to be "a valuable tool in interpreting Red Cross nursing programs to schools of nursing and other nursing groups."

ALASKA PUBLIC HEALTH MEETINGS

The Alaska Department of Health recently held two meetings each of a week's duration for public health workers in Southeast Alaska and the Interior, respectively. Their theme was "Health Progress in Alaska" and represented the first year of general meetings rather than specialized institutes. Another departure from previous meetings was an exhibit, participated in by the health, welfare, and labor departments, the Alaska Cancer Society, Tuberculosis Association, and Crippled Children's Association. Guest speaker was Lee Powers, M.D., executive officer, department of preventive medicine, University of Washington College of Medicine. Over 170 persons attended the meetings of whom more than three-quarters took some part.

HEART DISEASE ACTIVITIES NEWS

The National Heart Institute of the Public Health Service in August began to publish the *National Heart Institute Circular* as an information medium to be issued from time to time "concerning research and related activities in the field of cardiovascular disease." The first issue is devoted to a summary of the organization and program of the National Heart Institute. News items on cardiovascular diseases, cardiac centers, and heart disease control programs will be welcomed and any information printed in the *Circular* may be reprinted. Heart Information Center, National Heart Institute, Room 2403, Building T-6, Bethesda 14, Md.

SURVEY OF HEALTH COUNCILS

The National Health Council has begun an inventory and analysis of state and local health councils in the United States. There are believed to be more than 500 such councils. The purposes of the study are to (a) gather current information concerning the number, location, characteristics, activities, and accomplishments of health councils; (b) analyze their patterns of organization and operation; (c) assess their effectiveness as instruments for planning and action in improving community health.

Samuel Peskin, who is completing work for the Ph.D. degree at Teacher's College of Columbia University, has been appointed on a nine month basis as a research fellow of the Council to carry on this study under the leadership of the Council's executive director, Thomas D. Dublin, M.D.

TRAINING MEDICAL SOCIAL WORKERS

The University of Illinois, through its Division of Services for Crippled Children, and the University of Chicago, through the School of Social Service Administration, announce a training project for medical social workers. The project provides for two types of training: (1) Six month field work in the Division of Services for Crippled Children with classroom courses at the University of Chicago. Apply to Dean, School of Social Service Administration, University of Chicago, Chicago 37. (2) Individually planned placements in the Division of Services for Crippled Chil-

dren for introduction into the activities of a medical social consultant in medical care programs. Apply to Director, University of Illinois Division of Services for Crippled Children, 1105 South Sixth Street, Springfield.

USING EXISTING AGENCIES

A program developed jointly by the New York State Committee on Tuberculosis and Public Health and the American Heart Association illustrates a pattern of existing state-wide organization to promote a relatively new special interest. The undertaking is a joint demonstration of organization, promotion, and service in the cardiovascular disease field. The agreement to coöperate in community heart disease activities was taken at the Annual Conference of the State Committee on May 10–11. The main points of the agreement are:

1. The State Committee on Tuberculosis and Health is designated by the American Heart Association as its representative agency in New York State.
2. A cardiovascular program undertaken in the state will be in accordance with the criteria and standards established by the American Heart Association.
3. Fund raising is the responsibility respectively of the tuberculosis and heart committees of local associations, one for the annual Christmas Seal Sale and one for the Heart Campaign in February.

INDUSTRIAL HYGIENE LABORATORY

The Medical Branch of the University of Texas at Galveston opened a research laboratory for industrial hygiene in September. It is planned particularly to coöperate with the heavy industries of nearby Texas City, but is available for consultation and service to all Texas industries. The laboratory is directed by Carl A. Nau, M.D., professor of preventive medicine and public health, and J. M. Neal, sanitary engineer.

ANNOUNCED WITH REGRET

The Lampasas-Williamson County Health Unit of Texas, population 56,000, has been discontinued. A new unit for Williamson County, population 43,000, has been organized, with headquarters in Georgetown. Effective July 1, C. C. Comer was appointed "Sanitarian in Charge" until a full-time medical director is appointed.

POSTGRADUATE COURSES: COLORADO MEDICAL CENTER

Poliomyelitis—Aided by a grant from the National Foundation for Infantile Paralysis, the University of Colorado Medical Center offers a series of postgraduate courses on poliomyelitis to physicians, with special emphasis on the comprehensive care of patients in an epidemic. Courses are open to physicians who reside in states west of the Mississippi. Three one week courses are currently scheduled: November 7–11, 1949, March 13–18, 1950, and May 22–27, 1950.

New-born Infants—A postgraduate course for the purpose of orienting the practising physicians in the problems of new-born infants, both premature and full term, sponsored by the University of Colorado School of Medicine and the Colorado State Department of Health, will be given November 2–5, 1949.

Guest lecturer is William L. Bradford, M.D., associate professor of pediatrics, University of Rochester (N.Y.) School of Medicine. Registration fee for this course is $5, tuition, $10.

Further information on both courses from Director, Graduate and Postgraduate Medical Education, University of Colorado School of Medicine, Denver, Colo.

BIRTH OF A BABY MODELS ARE WIDELY USED

According to an announcement by Bruno Gebhard, M.D., Director of the Cleveland Health Museum, the Washington State School for the Blind was the first institution of its kind to use the Dickenson-Belskie models which are

3 dimensional, sculptured models of human reproduction known as "The Wonders of New Life."

Other organizations now using duplicates of the models for teaching purposes include:

Butterworth Hospital, Grand Rapids
Clara Elizabeth Maternal Health Fund
City of San Jose, California
Dalhousie University, Halifax
Dallas Health Museum
Denver Public Health Department
Mississippi State Health Department
North Carolina College for Nurses
Nova Scotia Museum of Science
Ohio State University Medical School
Opportunity School, Denver, Colorado
Public School System, Ann Arbor, Michigan
Public School System, Jackson, Michigan
Public Health Committee, Honolulu
Tufts College
University of California
University of Oregon
University of Manitoba

A new folder describing these models as well as teaching models and film strips has been prepared by the Museum, together with price lists. Details available from Cleveland Health Museum, 8911 Euclid Avenue, Cleveland 6.

DR. UNDERWOOD'S 25TH ANNIVERSARY

A large group of his friends and associates gathered in Jackson, Miss., on August 8 at a dinner commemorating 25 years of service as State Health Officer of Felix J. Underwood, M.D.

The program was under the chairmanship of Mrs. Elizabeth N. Wates. The toastmaster was Dr. Henry Boswell. Governor Fielding L. Wright spoke and presented gifts to Dr. Underwood. His service was eulogized in the words of Alexander Pope:

"Statesman, yet friend to truth; of soul sincere
In action faithful, and in honor clear;
Who broke no promise, serv'd no private end,
Who gained no title, and who lost no friend."

NEW YORK'S DOZEN

With the establishment on November 1 of the Seneca County Health Department, 12 of the 57 New York upstate counties will have full-time county health departments. The way was cleared for the establishment of the Seneca County Health Department by resolution of the Board of Supervisors and the subsequent approval of the State Health Commissioner. This is the sixth county to organize under the 1947 public health law. Under the earlier permissive law for county health departments passed in 1921, only six counties had been organized.

MILK QUALITY AND MILK REGULATIONS

A study of the effect of health and sanitary regulations upon milk quality is being undertaken by the National Research Council under a contract with the U. S. Department of Agriculture, financed by the Research and Marketing Act.

Market milk and its products must conform to various statutes, ordinances, and regulations adopted and administered by local, state, and federal authorities for the purpose of protecting public health. Such regulations are applicable to production, processing, and distribution, and are designed to insure the maintenance of various safety, nutritional, and esthetic properties of milk and its products. They may differ widely in requirements and differ also with respect to administrative interpretation and enforcement practices.

The purpose of the present study is to determine precisely what requirements are being enforced in representative jurisdictions and how the requirements affect the quality of milk delivered to the consumer. In this study the term milk is considered to include market milk and such milk products as cream and skim milk for fluid use and for use in the manufacture of ice cream.

It is planned, initially, to study municipalities with populations between 100,000 and 500,000 and the states within which these cities are situated.

Statutes, ordinances, and regulations will be compiled in order to determine the range of variation of actual requirements in force, and select typical jurisdictions for intensive field study, including associated administrative and enforcement procedure. The effect of regulations upon quality will be investigated through laboratory and other research methods.

DR. WOLMAN TO EUROPE FOR WHO

Abel Wolman, head of the Sanitary Engineering Department of Johns Hopkins University, attended the first meeting in Geneva, beginning on September 10, of the newly organized Expert Committee on Environmental Sanitation of the World Health Organization, as United States representative.

The meeting drafted a program for improved sanitation in member countries of WHO. Water supplies, sewage disposal, control of mosquito-borne diseases, among other topics, were on the agenda.

POSTGRADUATE INDUSTRIAL HYGIENE

Beginning with the current academic year, the Harvard University School of Public Health's department of industrial hygiene has undertaken a new type of postgraduate industrial health program. The program, divided into three major fields: industrial medicine, environmental hygiene, and public health, includes courses in planning, organizing, and directing health efforts of industrial companies, whole industries, groups of companies and employees. The related teaching and research facilities of Harvard University, including certain special facilities at the Massachusetts Institute of Technology and other coöperating institutions, are available.

The head of the department is Philip Drinker, LL.D. The courses are open to all qualified physicians, with preference to persons who have had experience in industrial medicine. Successful candidates will be awarded the newly established degree of Master of Industrial Health.

Apply secretary, Harvard School of Public Health, 55 Shattuck Street, Boston 15.

FLORIDA'S DIABETES PROGRAM

A state-wide diabetes service program of the State Board of Health was begun in Florida in July. It followed the patterm of case finding and education established by the Public Health Service Diabetes Demonstration Unit in Jacksonville. The State Health Department decision to initiate this service on a statewide level followed the numerous demands for the program when the work of the Jacksonville unit, one of two in the country, had been recognized as highly successful. There is testing for diabetes, especially among relatives of diabetics; free insulin is provided those unable to afford it. Classes for diabetics are held in county health departments and help given to groups of diabetics who wish to start a diabetes association. A monthly educational bulletin is sent to diabetics and their relatives.

ECPD NEWS

The present status of the accreditation of engineering schools and curricula was announced at a recent meeting of the Engineers' Council for Professional Development. H. T. Heald, chairman of the Committee on Engineering Schools of ECPD reported inspections of 106 engineering colleges during the previous two years. During these inspections, 481 curricula were reviewed, including 112 inspected for the first time. By the end of the current inspection year "a large share of the previously accredited curricula will have been reviewed and virtually all new curricula for which inspection has been requested will have been examined." The committee is also studying the accreditation of graduate work in engineering. A joint committee of ECPD and the A.P.H.A. has been

in existence for the past two years, formed for the purpose of studying accreditation of graduate engineering courses designed for engineers planning to enter public health.

RED CROSS BLOOD PROGRAM

Ross T. McIntire, M.D., director of the American Red Cross National Blood Program, reports that by June 30, 1949, nearly 275,000 pints of blood had been collected in the regions where the program is in operation. The blood has been made available to 1,100 hospitals, 50 independent clinics, and 145 practising physicians. The Blood Program has prepared " General Functions of the Chapter Medical Advisory Committee," which it is making available to appropriate medical groups.

INDIANA TUBERCULOSIS COUNCIL

The 1949 Indiana General Assembly established a Tuberculosis Council to aid the State Board of Health in the treatment and care of tuberculosis. The executive secretary of the seven man board recently appointed by the Governor is Murray Auerbach, Executive Secretary of the Indiana Tuberculosis Association.

WASTE TREATMENT CONFERENCES

Two conferences on waste treatment have been announced. The first, the Second Annual Public Health Engineering Conference, will be held in Gainesville, Fla., on November 18 and 19 under the auspices of the Civil Engineering Department of the University of Florida. The general theme will be Economics of Sewage Treatment. Room reservations can be made at the Hotel Thomas or the White House Hotel. Further information can be obtained from Prof. John E. Kiker, Jr., at the University.

The Fifth Industrial Waste Conference, under the auspices of Purdue University, will be held at the University, Lafayette, Ind., on November 29 and 30. Developments in waste disposal and utilization will be discussed. Legal aspects will be included. Registration fee $4.00. Room reservations can be made at the Union Club on the campus or the Fowler, Cedar Crest, or Lahr Hotels. Prof. Don E. Bloodgood is Chairman.

ALASKA VITAL STATISTICS BUREAU

A bill passed by the recent session of the Alaska Territorial Legislature transfers responsibility for vital statistics to the Territorial Department of Health. Hence, a vital statistics bureau has been set up at the central office in Juneau. Dr. Albert Bailey and Dr. Francis E. Kester from the National Office of Vital Statistics in Washington helped to set up the new bureau.

SOUTH CAROLINA ASSOCIATION OF SANITARIANS

The following officers were recently elected by the South Carolina Association of Sanitarians during their meeting at Myrtle Beach, S. C.

President: Harry D. McDaniel
Vice President: E. T. Ammons
Secretary-Treasurer: Charles A. Farish

PROGRESS UNDER HILL-BURTON HOSPITAL CONSTRUCTION PROGRAM

A report by the Public Health Service as of June 30, 1949, shows that 501 projects have been finally approved for federal aid under the Hill-Burton Act for hospital construction, and that 290 more projects have been initially approved.

According to this report, 35 projects have been completed and 112 others are more than half completed. Those under construction at the present time total 355. In spite of the fact that actual payments made by the federal government to date total only $10,600,000, the total overall cost of these projects is about $500,000,000, one-third of which will eventually be borne by the federal government.

STREAM POLLUTION FUND ALLOCATIONS

The office of the Federal Security Administrator announces the provisional allotment of $850,000 to the states, territories, and the District of Columbia for grants to study water pollution resulting from industrial waste. This sum is part of the $2,200,000 appropriated by the 81st Congress for the purpose of initiating a nation-wide program of water pollution control and prevention. Each of the states and territories and the District of Columbia is represented in the provisional allotment. The largest sum, $35,326, is proposed for the State of New York; the smallest, $8,645, for the Virgin Islands.

LOULA DUNN A.P.W.A. DIRECTOR

The appointment of Loula Dunn as Director of the American Public Welfare Association has been announced by Joseph E. Baldwin, President of the Association and Director of the Milwaukee Department of Public Welfare. Miss Dunn has been the Commissioner of the Alabama State Department of Public Welfare since 1937. She assumed her duties with the Association September 20.

Miss Dunn was President of the American Public Welfare Association in 1945 and 1946 and has also held national office in the American Association of Social Workers, the Child Welfare League of America, and the American Society for Public Administration.

PROPOSED SURVEY OF SICKNESS IN THE UNITED STATES

Senator Claude Pepper of Florida jointly with Senator James E. Murray of Montana has introduced Senate Bill 2211 to provide for a survey of sickness in the United States. The Bill has been referred to the Committee on Labor and Public Welfare.

According to the Bill, it is pointed out that the latest information of the number of persons in the country suffering from heart disease, cancer, diabetes, rheumatism, arthritis, and other disabling diseases, injuries and handicapping conditions, is now thirteen years old and seriously out of date. The Bill points out that such information is urgently needed for (1) an appraisal of the true state of health of our citizens, (2) for the effective planning of any programs to improve their health, (3) for research in the field of chronic diseases, (4) for an evaluation of the impact of long illness upon the economic status of families with members so afflicted, and (5) for measurement of the numbers of persons in the working ages so disabled as to be unable to perform gainful work.

The Bill proposes that the Surgeon General of the Public Health Service be authorized and directed to make a survey by the most reliable means of the number of persons affected by chronic or other disease or injury or handicapping condition, the type of disease or injury of each person so afflicted, and the length of time that each such person has been prevented from carrying on his usual occupation or activities. A report is to be made within twelve months. The Bill carries an authorization of such sums as are needed, not exceeding in the aggregate $750,000. It is further provided that similar surveys shall be conducted at four year intervals.

WABASH RIVER POLLUTION STUDY

The Ohio River Valley Water Sanitation Commission has commenced studies of the Wabash River between Terre Haute, Ind., and Mt. Carmel, Ill., to determine the extent of pollution of the river. Necessary action to prevent unwarranted pollution of the stream by municipal or industrial waste discharges will be determined as a result of the study. Robert K. Horton will direct the studies. Clarence Klassen and Blucher A. Poole will represent Illinois and Indiana, respectively, in the work.

NATIONAL STANDARDS AND LOCAL ORDINANCES

Nationally Recognized Standards in State Laws and Local Ordinances, published by the American Standards Association, 70 East 45th Street, New York 17, presents the pros and cons of incorporating in local ordinances nationally recognized standards by title reference only. Legal handicaps to such a procedure are discussed as well as possible methods for doing it. The legal requirements of the various states are given.

PERSONALS

C. F. ADAMS, M.D.,* was appointed Acting Director of the Division of Health, State of Missouri, Jefferson City, effective June 6, succeeding ROBERT M. JAMES, M.D.

J. B. ASKEW, M.D., M.P.H.,† for the past 2 years Assistant Director, has been appointed the Director of Public Health for San Diego City and County (California), succeeding ALEX M. LESEM, M.D.*

LOLA BEAGLE has joined the staff of the Ohio Department of Health as a field nursing consultant, for the 18 counties of State Health District 4, with headquarters in Athens.

WELBY W. BIGELOW, M.D.,† who resigned as Acting State Health Officer, Utah State Department of Health, Salt Lake City, has been appointed Surgeon (R) in the U. S. Public Health Service and has been designated as Chief of the Office of Personal Health Services in Regional Office No. 4, Cleveland, Ohio.

CHESLEY BUSH, M.D., is acting executive secretary, California Tuberculosis and Health Association, San Francisco, succeeding H. FORD HIGBY, deceased.

CAROLINE H. CALLISON, M.D.,* has been appointed Health Officer for the Rockingham-Harrisonburg, Health District, Virginia.

EDWIN CAMERON, M.D., M.P.H.,* formerly Health Commissioner of Delaware, was appointed chief of the Division of Local Health Administration, Connecticut State Department of Health, effective July 1.

WILDA CAMERY,† formerly education director of nurses, Montclair (N. J.) Health Department, is now assistant chief in education, Pittsburgh (Pa.) Department of Public Health.

VICTORIA M. CASS, M.D.,† epidemiologist and editorial research and coördinator in the Massachusetts State Department of Public Health, is on a year's leave of absence to work toward a master's degree in public health in the Harvard School of Public Health under a fellowship grant.

JOHN W. CLAIBORNE, formerly Chief Medical Officer, Veterans Administration Regional Office, Nashville, Tenn., has become manager of the V-A hospital at Jefferson Barracks, Mo.

J. RICHARD CONNELLY, formerly Assistant Secretary of the Medical Society, District of Columbia, has been made Executive Director of the American Diabetes Association, with headquarters at 1 Nevins Street, Brooklyn, N. Y., and Business Manager of the Association's magazine, ADA *Forecast* and other publications.

ROLAND R. CROSS, M.D.,† has been reappointed Illinois State Director of Public Health, effective June 1.

A. V. DENEVEU, M.D., has become Health Officer of Wisconsin State Health District 1, with headquarters in Madison.

ROBERT H. ENGLISH, M.D., is now clinical director of Kentucky's cancermobile and 18 cancer clinics sponsored by the State Health Department

---

* Fellow A.P.H.A.
† Member A.P.H.A

and the Kentucky Chapter of the American Cancer Society.

MILTON FEIG, M.D., M.P.H.,† began service as Health Officer of Wisconsin State Health District 6, with headquarters in Green Bay, in January.

LLOYD FLORIO, M.D., DR.P.H.,* Professor of Public Health, University of Colorado School of Medicine, Denver, has been awarded a fellowship from the World Health Organization for a 3 month study period in Europe. He will study in Denmark, Italy, and England, problems of teaching preventive medicine and public health, the organization of health departments, the British medical care plan, and tissue culture work.

OLLIE M. GOODLOE, M.D.,† Health Commissioner of Columbus, Ohio, recently received the 1949 "Outstanding Citizen Citation for Public Service," by the Columbus Junior Chamber of Commerce with specific mention of the venereal disease control program and the training classes for food and milk handlers and producers, and barbers.

WILLIAM W. HARGRAVE, M.D., is now Health Officer for the Campbell-Charlotte Health District, Virginia.

MARGARET E. HATFIELD, M.D.,† Health Officer of Wisconsin's State Health District 9, has resigned to accept a position with the Milwaukee City Health Department.

PATRICIA I. HEELY, R.N.,† has been appointed Director of the Bureau of Public Health Nursing of the New York City Department of Health, succeeding HORTENSE HILBERT, R.N., who has served in a temporary status in the position for several years.

HELEN EDGECOMB HESS has been appointed Associate Director of the Adelphi College, Garden City, N. Y., School of Nursing, where she will direct the advanced program in Psychiatric Nursing offered for the first time in September, 1949.

MARY BURNETT HORTON,† who has been Educational Director for the Sheffield Farms Company, New York, has been elected to its Board of Directors, the first woman to become a member of the Company's Board in its 108 years of operation.

DANIEL J. HURLEY, M.D.,† has returned to Nevada as State Health Officer following an academic year in the University of California School of Public Health, where he received the degree of Master of Public Health.

WADDIE P. JACKSON, M.D., has been appointed Health Officer for the Bedford-Franklin Health District, Virginia.

RAYMOND KINSEY, PHAR.D., a member of the Public Health Service staff since 1914, has been appointed pharmacist director of the Public Health Service, the first pharmacist officer to be appointed to the director grade in the history of the Service.

MILTON E. KOSSACK, M.S.P.H.,* formerly Director of Health Education, New Orleans Health Department, is now Director of Health Education, Louisiana Sfate Department of Health.

ALEXANDER D. LANGMUIR, M.D., M.P.H.,* has resigned as Associate Professor of Epidemiology at Johns Hopkins University School of Hygiene and Public Health, Baltimore, to become Chief of the Epidemiology Division of the Public Health Service Communicable Disease Center in Atlanta.

COLONEL CHARLES S. LAWRENCE, retired from the Army in September, 1949, has been appointed Executive Secretary of the Institute of Food Technologists and Business Manager of *Food Technology*, the official organ of that society, with headquarters in Chicago.

---

* Fellow A.P.H.A.
† Member A.P.H.A.

KENNETH E. MARKUSON, M.D., M.P.H.,† formerly Director of the Bureau of Industrial Health, Michigan Department of Health, became Assistant Medical Director, Bureau of Industrial Hygiene, Connecticut State Department of Health in July.

ALBERTA MARTIN recently retired as Orthopedic Public Health Nurse, New York State Health Department, after serving in that capacity since 1931.

HELEN A. MASON, formerly medical social worker, University of Colorado Medical Center, has joined the Social Service Section as medical social consultant, Colorado State Health Department.

MYRTLE OLSON, R.N.,† formerly Trempealeau County (Wisconsin) Nurse is now tuberculosis consultant in the Visiting Nurse Association of New Haven, Conn. She is succeeded by BETTY GODWARD, R.N., formerly with the Winona, Minnesota, Health Department.

CHARLES RICHARDSON, JR., M.D., Deputy State Health Officer, Hartford County, Maryland, has resigned to engage in the private practice of medicine.

WILLIAM SALERO has been employed as a food and drug inspector, in the Food and Drug Division, Kansas State Board of Health.

MARY JANE SKENADORE, R.N., has left the Marathon County (Wisconsin) Health Unit to join the Navy Nurse Corps, and is stationed at the U. S. Navy Hospital, Chelsea, Mass.

HOWARD A. STREETER, M.D.,* has retired as Health Officer of Manchester, has bee Powers.

IVA TORRI fessor of cuse Un has join the Vete Service i

CLAIR E. TURNER, DR.P.H.,* assistant to the president of the National Foundation for Infantile Paralysis, was employed during August and September, by the World Health Organization, "to conduct a preliminary survey in the field of health education and to draft initial plans for the World Health Organization program in this field."

JAMES D. VAGNEUR, D.V.M.,† formerly public health veterinarian, Grand Junction, Colo., is now director of the veterinary public health program, with special attention to milk sanitation in the Colorado State Health Department, having just received the Master of Public Health degree from the University of Michigan.

JOHN WAKEFIELD,† with the department since 1937, has been named Director of the Sewage and Waste Disposal Division, Bureau of Sanitary Engineering, Florida State Board of Health after completing work for his master of science degree in sanitary engineering at Harvard University.

DOROTHY JEAN WINANS has been appointed Vital Statistics Registration Supervisor, Virginia State Department of Health.

ALICE WOOLDRIDGE, most recently Red Cross district nurse for western Pennsylvania, has become public health nursing supervisor, Pittsburgh (Pa.) Department of Public Health.

ALASKA TERRITORIAL DEPARTMENT OF HEALTH, NEW STAFF MEMBERS:

GRACE E. FIELD, M.D., Assistant Director, Communicable and Preventable Disease Control Division

JOHN R. KUHN, Laboratory X-ray Technician, to be stationed aboard the HEALTH, one of the Departments marine units.

WENDELL C. MATHEWS, M.D., Tuberculosis Control Consultant, stationed at the Anchorage branch office. He was formerly Associate Radiologist, Franklin County Public Hospital, Greenfield, Mass.

DEATHS

HELEN E. BOND,* Director of Nursing Service, City Health Department, Savannah, Ga. (Public Health Education Section).

PAUL A. BREHM, M.D., Director of Industrial Hygiene, Wisconsin State Board of Health, died recently.

BRUCE H. DOUGLAS, M.D.,* Commissioner of Health, Detroit Department of Health, was killed in an automobile accident on August 11 (Health Officers Section).

SARI P. MAYO,† New York City, died recently (Public Health Education Section).

HENRY E. MEDBURY,† Technical Service Director, American Bottlers of Carbonated Beverages, Washington, D. C., died several months ago (Food and Nutrition Section).

ALMON L. FALES,* Newton Center, Mass. (Engineering Section).

ARTHUR D. JAQUES, M.D.,† Visiting Psychiatrist, Meadowbrook Hospital, Lynbrook, N. Y. (Unaffiliated).

IRL B. KRAUSE, M.D.,* Jefferson City, Mo. (Maternal and Child Health Section).

A. VICTOR NASATIR, M.C. Surgeon, M.D., M.S.P.H.,* Director of Industrial Hygiene, Los Angeles City Health Department (Industrial Hygiene Section).

DONALD C. TULLOCH, M.D., M.P.H.,† New York State Department of Health, Albany, N. Y. (Epidemiology Section).

Announcing—

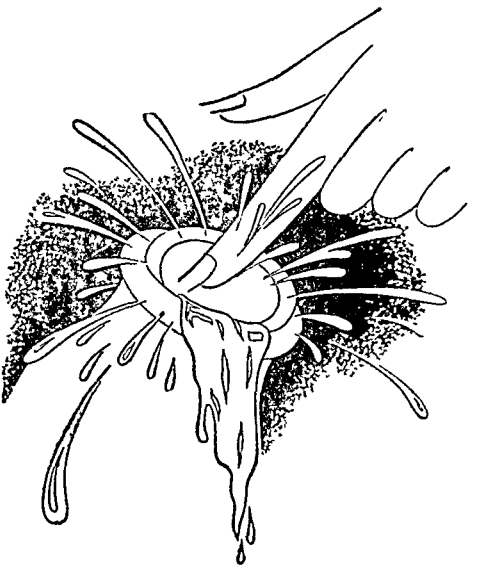
Salundek

A new antimycotic, proven to be effective in

TINEA CAPITIS

Control of this refractory fungus infection has been a distressing problem. Because of the inconvenience and possible hazards of X-ray treatment (1) research was stimulated for drugs for topical application.

In SALUNDEK Ointment, Wallace & Tiernan offers a practical solution to problems of dosage and penetration (2). Established antimycotics (undecylenic acid-zinc undecylenate) are combined with an effective penetrant in a proper base.



SALUNDEK Ointment is virtually non-irritating. With persistent application, the average case can be cured in a relatively short period.

Supplied in 1 ounce Tubes and 1 pound Jars. Available at all prescription pharmacies.

PROTECTS CONSUMERS AGAINST *THEMSELVES!*

Milk contamination can too often occur in the hands of the ultimate consumer. Fork-prying and finger-pushing methods of opening bottles and careless discarding of a separate hood—common in both home and restaurant—constitute real threats to milk purity.

Genuine snug-fitting Seal-Kaps minimize these dangers. Seal-Kaps come off with a simple twisting motion. No need to pry or push. And they *snap back on* as often as necessary to protect securely the pouring lip until the last drop is used. There is no separate hood to discard, because Seal-Kap is disc and hood *in one.* And since it's so convenient to use, consumers automatically enjoy a superior protection—protection *against themselves!*

AMERICAN SEAL-KAP CORP.

The B-K PR PLAN stands for better patron relations between farmer and dairy plant. As the basis for this, a complete program has been set up by the makers of B-K to help the farmer produce top quality milk through a definite and efficient dairy sanitation program.

This B-K PR PLAN offers the dairy farmer . . . through his fieldman . . . informative films, recordings, literature and other educational material . . . that directs the farmer's attention to the need for positive dairy sanitation.

You can depend on the authenticity and accuracy of the material used in this B-K PR PLAN, for it has been carefully prepared by the makers of B-K Products—the backbone of many quality milk programs. Find out more about the B-K PR PLAN and how you can play a part . . . we'll send full details on request. Write: Dept. PR, B-K Division, Pennsylvania Salt Manufacturing Company, 1000 Widener Building, Philadelphia 7, Pa.

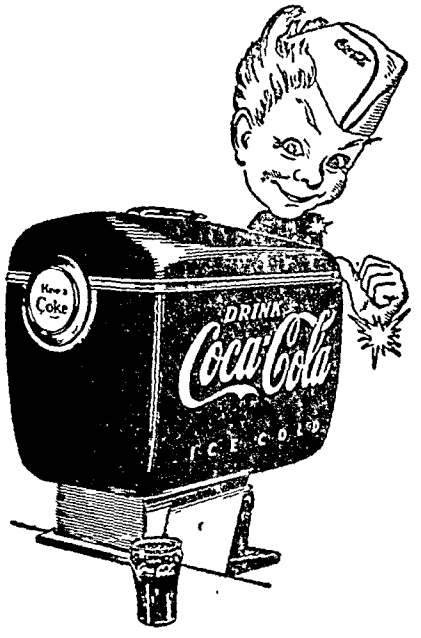
Signature . . .. Address . .....



NOTE: Sponsors must be two members and/or Fellows of the American Public Health Association. It is essential that your application be sponsored, but if you cannot obtain the signatures of two persons affiliated with the Association, write their names and addresses in the spaces above and we will get in touch with them for you.

DUES A remittance for $. is enclosed. Dues will be paid by .

. . . . .. and a bill should be sent to that address.

Annual membership dues are $7.00 ($7.50 Canada; $8.00 foreign countries exclusive of Latin America) and include a subscription to the American Journal of Public Health as well as the other services maintained by the Association. The membership year is the same as the calendar year. Members joining during the first six months of the year will receive the Journal from January onward. Members joining after July 1st are requested to pay $10.50 (Canada $11.25, foreign $12.00) covering the latter half of the current year and the whole of the ensuing year, the Journal beginning with July of the current year.

International

Centrifuges of Proven Performance

Size 2

When selecting your new Centrifuge—consider:

Size 1 Type SB

1 **The reliability of the electric motor that drives it.**
The motors of International Size 1 and Size 2 Centrifuges are specially designed to provide the best possible drive for a Laboratory Centrifuge. They are manufactured entirely in our own shops, thus eliminating the possibility of obsolescence through discontinuance by an "outside" manufacturer.

2 **The range of its application.**
Interchangeable accessories designed specifically for International Centrifuges are available in wide variety, making the machines adaptable to practically every laboratory application. Your future requirements as well as your present needs should be considered.

3 **The relation of first cost to total cost.**
Expensive repairs can make a low first cost a high cost in the long run. International Centrifuges are famous for their ability to give years of trouble-free service.

4 **The reputation of the manufacturer.**
International's fifty years of specialization in the manufacture of Laboratory Centrifuges is your guarantee of unequalled performance.

The Importance of Meat To Your Geriatric Patients

That a significant number of elderly persons suffer from a deficiency of protein, iron, B complex vitamins, and calcium is the consensus of most geriatrists. Depending upon the extent and duration of these nutrient deficits the well-being and stamina of the individual are undermined, not infrequently to the point where the presence of organic disease may be suspected. Furthermore, nutrient deficiencies of long standing lower resistance to infectious disease and appreciably increase the hazards of surgery.

Thorough evaluation of the dietary of aged patients with particular emphasis on protein, iron, B complex vitamins and calcium, and institution of indicated adjustments in dietary habits can produce results gratifying to both patient and physician. Meat, an important source of biologically complete protein, iron, and B complex vitamins, has earned a deserved position in the dietary of elderly persons as well as in the dietary of younger individuals. Rarely contraindicated even in the presence of cardiovascular or renal disease, meat leads to virtually no alimentary difficulties since the more tender cuts are digested with particular ease. In the presence of mastication impairment ground meat may be employed. A serving or two of meat daily in the dietary of the aged goes far in preventing nutrient deficiencies and can contribute significantly to health and well-being.

The Seal of Acceptance denotes that the nutritional statements made in this advertisement are acceptable to the Council on Foods and Nutrition of the American Medical Association.

DIFCO

Media for BLOOD CULTURE

Satisfactory media for culturing pathogenic bacteria from the blood stream are essential for a high percentage of positive isolations in bacteriemias.

BACTO-BRAIN HEART INFUSION

is recommended for cultivation of many organisms which are generally considered difficult to propagate. It is an excellent liquid medium for cultivation of the Streptococci, Pneumococci and Meningococci. The addition of 0.1 per cent agar greatly enhances the value of the medium for blood culture work.

BACTO-TRYPTOSE PHOSPHATE BROTH

a peptone medium without tissue infusion, supports luxuriant growth of many fastidious bacteria. Like Brain Heart Infusion, it is an excellent liquid substrate for Streptococci, Pneumococci and other pathogenic bacteria.

BACTO-BLOOD AGAR BASE

enriched with sterile defibrinated blood, permits development of clear and distinct zones of hemolysis by colonies of hemolytic bacteria. Blood Agar prepared from this medium is especially useful for identification of Streptococci.

BACTO-TRYPTOSE AGAR

is an excellent general culture medium for many types of bacteria. It is especially well suited for direct isolation of organisms from the blood stream. The dextrose present in this medium supports early and luxuriant growth of bacteria but renders it unsatisfactory as a base for blood agar for differentiation of cultures on the basis of hemolysis.

Specify "DIFCO"

THE TRADE NAME OF THE PIONEERS

In the Research and Development of Bacto-Peptone and Dehydrated Culture Media

DIFCO LABORATORIES

DETROIT 1, MICHIGAN

A "superior" compound among the nearly 1000 antiluetics studied by Ehrlich,[1] an antispirochetal agent *distinguished by more than* a decade of clinical successes, the trivalent arsenoxide MAPHARSEN is an arsenical of choice in the treatment of syphilis.

MAPHARSEN®

an arsenical of choice in the treatment of syphilis

The antiluetic structure of MAPHARSEN symbolizes consistently *high therapeutic efficacy* and consistently *low relative toxicity,* as attested by more than two hundred million injections and extensive serological follow-ups. MAPHARSEN is valuable, either alone or with penicillin, in syphilotherapy schedules of all three familiar types—intensive, intermediate, prolonged.

MAPHARSEN (oxophenarsine hydrochloride, P. D. & Co.) is supplied in single dose ampoules of 0.04 Gm. and 0.06 Gm., boxes of 10; and in multiple dose ampoules of 0.06 Gm. in boxes of 10.

What do you demand in a toxoid, Doctor?

small dosage volume?

purity?

concentrated potency?

high antigenicity?

Of course, doctor, you want the best possible combination of these advantages.

Research and manufacturing know-how of CUTTER, first producer of combined toxoids, have developed in their *new* purified toxoids products which meet all of your demands.

As an example, consider the superiority of the *new,* purified **DIP-PERT-TET***—for simultaneous immunization against diphtheria, pertussis, and tetanus:

1. **Immunization routine** *is simplified with three injections of 0.5cc each at monthly intervals.*

2. **Purified toxoids** *assure virtual freedom from reactions due to bacterial protein components.*

3. **Alhydrox****—*CUTTER'S exclusive adsorbing agent—results in a more solid immunity, fewer post-injection reactions, and less pain on injection.*

When single immunizations are indicated or booster shots are required, there is a PURIFIED TOXOID—CUTTER—available in both single and multiple dose packages. Your pharmacist has them in stock.

*__DIP-PERT-TET__—*Cutter's diphtheria and tetanus toxoids and pertussis vaccine combined for simultaneous immunization against diphtheria, pertussis, and tetanus.*

**__Alhydrox__—*Trade name for aluminum alhydrox adsorption, exclusive with CUTTER.*

SQUIBB INSULIN PRODUCTS

...purified...potent...rigidly standardized to meet the various requirements of diabetics.

short action: peak effect within 3 to 4 hours, waning rapidly

INSULIN SQUIBB
10-cc. vials (40, 80 & 100 units per cc.)

INSULIN MADE FROM ZINC-INSULIN CRYSTALS SQUIBB
10-cc. vials (40 & 80 units per cc.)

intermediate action: peak effect in 8 to 12 hours, with action continuing sometimes for 16 or more hours.

GLOBIN INSULIN WITH ZINC SQUIBB
10-cc. vials (40 & 80 units per cc.)

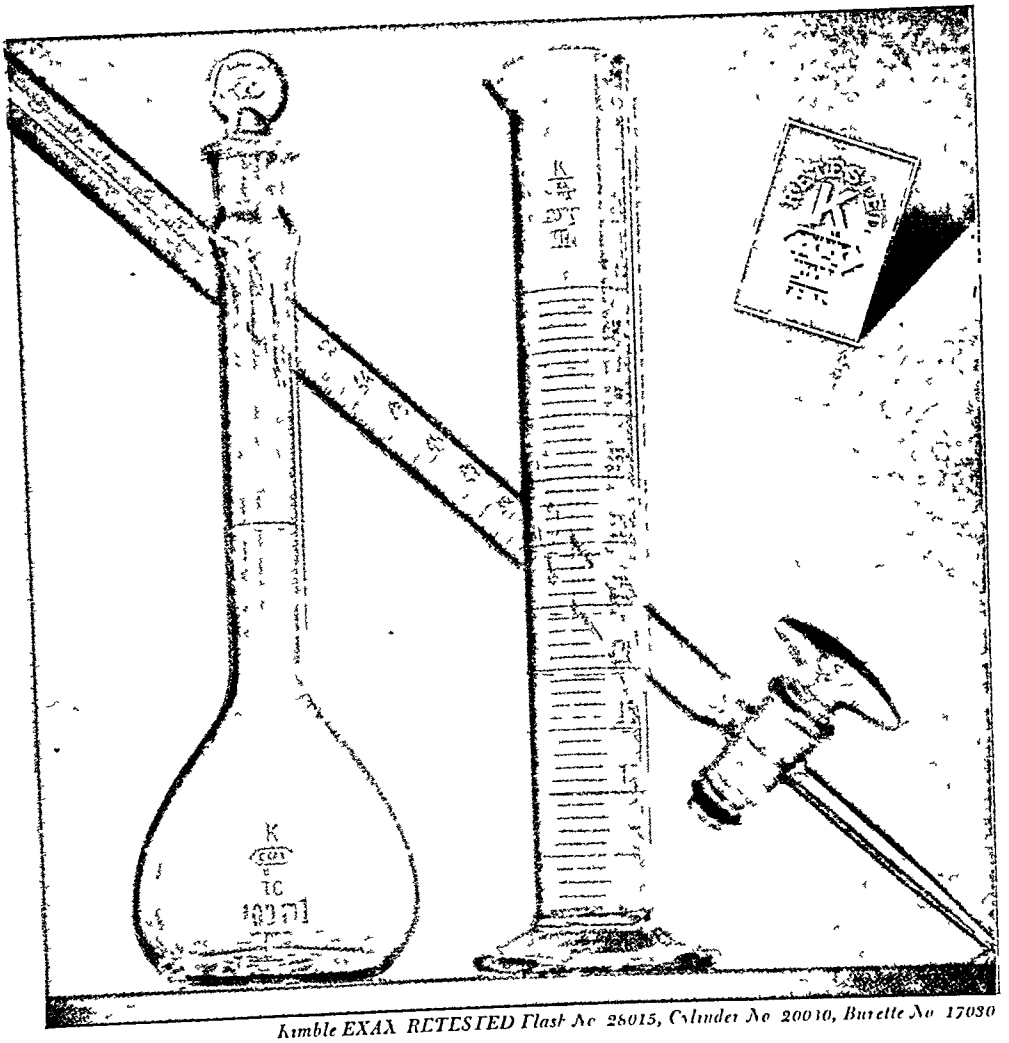
prolonged action: onset slow; peak effect in 10 to 12 hours, with action sometimes persisting for 24 or more hours.

PROTAMINE ZINC INSULIN SQUIBB
10-cc. vials (40 & 80 units per cc.)

SQUIBB MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

The new B-K PR plan is working...FOR YOU!

The B-K PR Plan stands for better Patron Relations between the farmer and the dairy plant. The fundamental point in this B-K PR Plan is the importance of a good dairy sanitation program . . . strictly enforced by the dairy farmer himself!



The B-K PR Plan offers the farmer . . . through his dairy plant fieldman . . . interesting, informative literature, films, special field tips . . . and other aids that direct the farmer's attention to the need for careful milk handling.

You can depend on the authenticity and accuracy of the material used in the B-K PR Plan . . . because it has been carefully prepared by the makers of B-K dairy chemicals . . . long a byword with dairy farmers, plant men and technicians. The B-K PR Plan is working . . . find out how you can play a vital part . . . we'll send full details on request. Write: Dept. PR-2, B-K Division, Pennsylvania Salt Mfg. Company, Philadelphia 7, Pa.

Kimble EXAX RETESTED Flask No 28015, Cylinder No 20010, Burette No 17030

There's no substitute for EXAX RETESTED quality

EXAX RETESTED is America's No. 1 choice for accurate laboratory determinations simply because it is made and intended for that purpose. EXAX won't bounce, but it is thoroughly annealed for toughness . . . will stand everyday handling and usage.

The great value of EXAX RETESTED lies in certain exclusive advantages. It is a special formula of glass, precision-made by specialty craftsmen.

The fine deep graduations are of a type which readily accepts the permanent fused-in blue filler. *And* . . . all calibrations are marked and checked and *retested* with standards of highest precision.

So remember, if accuracy and fitness for the job are important, there is no substitute for EXAX RETESTED glassware.

Look for the Kimble "K", the visible guarantee of invisible quality.

ELIMINATE THE HUMAN FACTOR
. . . in measuring hemoglobin
with the
FISHER ELECTRO-HEMOMETER

Rapid and accurate determination of hemoglobin in blood is possible with the Fisher Electro-Hemometer which operates on the acid-hematin principle. With this instrument, clinical examination becomes standardized because the human error of visual examination is eliminated. The direct reading scale shows the determination in both percentage of normal and grams per 100 ml. To the ease and accuracy of photometric measurement, the Electro-Hemometer adds speed and simplicity. No calculating is required and various operators achieve identical results. Supplied with this compact, portable unit are the photometric cell, standardizing cell, diluting pipette, the necessary batteries and printed instructions. Simplified operating directions are on the panel.

Bacteriological Safety in
BOTTLED
CARBONATED BEVERAGES

In tests in which carbonated beverages containing 2.6 volumes of carbonic gas were used, 950,000 B. coli were introduced into each cc. and at the end of 28 hours these were reduced to 20,000. Likewise, 200,000 typhoid bacilli were placed in the same amount of carbonated beverages and these were reduced to 25,000 in 4 hours.[1,2,3]

These are but two of the groups of many pathogenic organisms against which the action of carbon dioxide is both bacteriostatic and fungicidal. There is bacteriological safety in bottled carbonated beverages.

Modern techniques involving the highest principles of chemistry, bacteriology and engineering are employed in the manufacture of this wholesome refreshment.

CULTURE TUBES

Clinical research requires culture tubes in large numbers. Consequently, their cost, service life considered, is a matter of importance. From this standpoint alone, you will find that PYREX brand culture tubes are the best investment. Careful records maintained over a period of years by large culture tube users show that PYREX tubes last 3½ times longer than other brands.

This is not so surprising when you consider that no other glass stands up like PYREX brand No. 7740. Compare it with any other laboratory glassware under identical conditions. The superiority of PYREX ware to chemical, thermal and physical resistance will be readily demonstrated.

All of this is reflected in more accurate analysis. Your laboratory dealer carries complete stocks of PYREX brand culture tubes for your ordering convenience.

SANITIZING AGENT

The sanitizing properties of quaternary ammonium compounds are so well known to public health officials that little could be said about them that you do not know. Almost everybody in public health work has added the "quats" to the armamentarium he uses in his war on disease.

The question then, is which "quat"? Are they all alike? Which one can I depend on to do the job expected of it *every* time?

In Roccal, the original quaternary ammonium germicide, you are offered a product that is always uniform in quality because it is made under the most rigid controls. Every batch must pass the comprehensive laboratory tests of one of the world's leading pharmaceutical manufacturers. You can depend on Roccal to do a better sanitizing job *every* time!

When you specify a "quat"

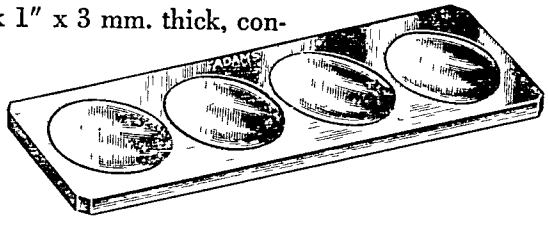
for the Diamond Rh Slide Agglutination Test*

Rh TYPING BOX

According to the design of Dr. Louis K. Diamond, Children's Hospital, Boston

This Rh Typing Box has a 12½ x 3″ evenly illuminated opal glass viewing area which accommodates standard 3″ microscope or concavity slides. It is so designed that the temperature of a specimen on a slide anywhere in the illuminated area is within the range of 37° to 42° C. It reaches the proper stabilized temperature in about 15 minutes at normal room temperatures; when there is considerable variation in room temperature, a slotted opening provides a means of modifying the temperature.

The box is made of gray hammertone finish sheet metal. Joints are free so that it can be rocked gently. It operates on 110 to 115 volts AC or DC.



A-2220 Rh Typing Box, complete with 40 watt Lumiline bulb.

Each $16.50

Centrifuges of Proven Performance

Size 2

When selecting your new Centrifuge—consider:

Size 1 Type SB

1 **The reliability of the electric motor that drives it.**
The motors of International Size 1 and Size 2 Centrifuges are specially designed to provide the best possible drive for a Laboratory Centrifuge. They are manufactured entirely in our own shops, thus eliminating the possibility of obsolescence through discontinuance by an "outside" manufacturer.

2 **The range of its application.**
Interchangeable accessories designed specifically for International Centrifuges are available in wide variety, making the machines adaptable to practically every laboratory application. Your future requirements as well as your present needs should be considered.

3 **The relation of first cost to total cost.**
Expensive repairs can make a low first cost a high cost in the long run. International Centrifuges are famous for their ability to give years of trouble-free service.

4 **The reputation of the manufacturer.**
International's fifty years of specialization in the manufacture of Laboratory Centrifuges is your guarantee of unequalled performance.

Throat Specialists report on 30-Day Test of Camel smokers—

"Not one single case of throat irritation due to smoking Camels!"

• Yes, these were the findings in a total of 2,470 weekly examinations of hundreds of men and women from coast to coast who smoked only Camels for 30 consecutive days! And the smokers in this test averaged one to two packages of Camels a day!

R J Reynolds Tobacco Co., Winston Salem, N C

According to a Nationwide survey:

More Doctors Smoke Camels

than any other cigarette!

Doctors smoke for pleasure, too! When three leading independent research organizations asked 113,597 doctors what cigarette they smoked, the brand named most was Camel!

Extending the *Usefulness* of Antibiotic Therapy in Tuberculosis

PARA-AMINOSALICYLIC ACID is a valuable synergist to streptomycin and dihydrostreptomycin therapy in tuberculosis. Its employment by oral administration along with injection of the antibiotics inhibits or significantly delays the emergence of resistant strains of organisms. The patient, therefore, may be given the benefit of a more prolonged period of effective chemotherapy.

Para-Aminosalicylic Acid by oral administration may be used as the sole chemotherapeutic agent when streptomycin or dihydrostreptomycin is contraindicated as, for example, in the presence of resistant organisms.

Para-Aminosalicylic Acid Merck, *a purified, white crystalline powder for oral administration, is available in 50 Gm. and 500 Gm. bottles and in 2.5 kilogram fiber drums. Literature on request.*

BREAK-POINT HELPS THIS WEST COAST WATER WORKS

Typical of what Break-Point Chlorination can accomplish is this case history.

A 1½ mgd. west coast water works using an impounded supply was troubled by summertime odors so acute that settling basins had to be washed almost continuously, while in the winter, color ran as high as 600 ppm. To overcome these troubles, several treatment methods were tried—unsuccessfully. Then W&T Engineers, in cooperation with the plant staff, carefully analyzed the situation. At their suggestion, the Break-Point Process was employed, using W&T Chlorinators for pre-chlorination. With this treatment, according to a report by staff members, color troubles, together with complaints concerning iron and manganese stains, were eliminated; filter runs increased; and summertime odors cut almost to the vanishing point.

In addition to such direct chlorination benefits, when you call on W&T you have the added assurance of W&T's 35 years of chlorination experience—a full line of chlorinators from which to choose—the backing of extensive research and development facilities—and finally, a top-notch, alert field organization at your call for prompt service and technical assistance.

For more details, ask your nearest W&T Representative —he'll be glad to help you.

The W&T Residual Chlorine Recorder is especially valuable in securing the best possible results with the Break-Point Process.

International Aspects of Child Feeding*

MARJORIE L. SCOTT

Nutrition Officer, Nutrition Division, Food and Agriculture Organization of the United Nations, Washington, D. C.

THE growth of nutrition as a science, especially within the last decade or two, is representative of the increasing value attached to it as a tool, not only in public health programs, but also in planning agricultural production and the distribution of food. Let us consider some of its international aspects as related to child feeding programs.

It may be remembered that in 1937 the Mixed Committee of the League of Nations said in its report: "The movement towards better nutrition in the past has been largely the result of the unconscious and instinctive groping of man for a better and more abundant life. What is now required is the conscious direction of the natural tendency towards better nutrition. Such direction constitutes policy. The primary concern of nutrition policy is with bringing foods essential for health and physical development within the reach of all sections of the community. . . ."

It was in this spirit that the problem was reviewed at the United Nations Conference on Food and Agriculture, held at Hot Springs in 1943. Those who are familiar with that Conference will recall that the basic principles which should guide FAO in its nutritional activities and the objectives to be aimed at were fully discussed.

At the Quebec Conference in 1945 where FAO—The Food and Agriculture Organization of the United Nations—came into being, it was recommended that improvement of the diet of pregnant and nursing women, infants, preschool and school children should be an immediate occupation of FAO, and likewise hold a prominent position in its long-term program. It is the Nutrition Division, one of the six technical divisions of FAO, that has concerned itself with this task.

Malnutrition in varying degrees is known to exist in all classes and in all countries. Aside from an inadequate food supply—either local, such as the milk-deficit areas in the Southern United States, or national, such as still obtains in many countries today—poverty and

* Presented at a Joint Session of the American School Health Association and the Food and Nutrition Section of the American Public Health Association at the Seventy-seventh Annual Meeting in New York, N. Y., October 27, 1949.

ignorance are recognized as the chief causes of malnutrition.

School feeding programs can play an important role in combating malnutrition. The extent to which they may supplement the home diet will, of course, vary, depending upon the economic status and the food habits of the group concerned. But an important aspect is the very excellent opportunity they afford for education in nutrition. The school child is at a vulnerable age when good or bad food habits, which may have a bearing on his whole life, are formed. Furthermore, the knowledge and appreciation of nutrition gained by a child at school are frequently transferred to the parents and may influence their choice of foods.

School meals are perhaps the most common form of supplementary feeding, and programs differing considerably in their organization and scope operate in various countries. It is interesting to note that the provision of meals for school children was originally undertaken by charitable or voluntary organizations as a means of assisting needy children.

Frequently, the so-called "meal" took the form of a bowl of broth or a slice or two of bread, and contributed very little to the child's nutritional needs. Gradually, however, education authorities took an interest in school feeding as they began to realize the important influence of an adequate diet on the well-being—and behavior—of children. Today in some countries such as the United Kingdom and the United States, there are national school feeding programs supported by government legislation. In some countries voluntary organizations have initiated local programs, while in others no action has as yet been taken. The recent war and the acute food situation which followed, served to highlight the value of supplementary feeding programs in maintaining or improving the health of vulnerable groups. Much of the work of relief organizations has been directed toward the feeding of children, and in some instances their activities are leading to the establishment of government sponsored programs.

There is considerable variation in the type of food provided. In the United Kingdom a complete hot meal is served, and about 52 per cent of the school children now participate in the program, as compared with 4 per cent in the prewar period. This is in addition to a milk-in-school scheme which was introduced before the war and in which a large percentage of the children continue to participate. In some countries preference is given to the distribution of milk only. This method of supplementing the diet has application in those countries such as Belgium and the Netherlands, in which traditional customs require the child to be part of the family group for all meals. Of interest is the School Breakfast recently instituted in Greece by the Ministry of Education and which is reported to be gaining in popularity. The meal consists of a cup of hot milk cocoa and a slice of milk raisin bread. The development of a palatable block or pellet of milk powder, sometimes with added flavoring, has proved useful and popular in districts where fresh milk supplies, or facilities for preparing food of any kind, are not available.

FAO's Nutrition Division has been collecting information on the programs which are in operation, and is planning a series of publications designed to encourage and assist governments in developing programs of a practical and feasible nature. Another aspect of our work relates to regional activities. Meetings of nutrition workers are convened to survey the nature and extent of nutrition problems in a particular area and to draw up recommendations which will serve as a basis for initiating or developing programs designed to improve nutrition in that area. For example, in

February, 1948, a Committee of Nutrition Workers from countries in East Asia was held at Baguio, the Philippines.[1] The diet in this region is characteristically low in calories, as well as in protein and other nutrients. The Committee recognized that it is impossible to provide adequate quantities of milk for the millions of children in the vast areas of Asia and that attention must be given to available foodstuffs of high nutritive value.

Incidentally, various projects have been undertaken in India to develop a satisfactory soybean milk and curd and to study their nutritive value as compared with that of cow's milk. In Bangalore an extensive experiment has been carried out on a group of school children. Preliminary results indicate that the soy products are somewhat inferior to cow's milk in supplementing the rice diet. However, there are considerable economic advantages and this work will doubtless have application throughout the rice-eating area.

The Baguio Committee recommended a type of free meal for school children based on cereals such as lightly milled rice, high extraction wheat, and millets, a pulse, small fish of which the whole body can be eaten and therefore provide calcium, a vegetable with preference given to green leafy ones, and oil, preferably an oil containing carotene. In the amounts suggested, these foods will form a meal of about 400 calories, which will contain the most essential nutrients. It can, of course, be modified in various ways in accordance with local conditions and the availability of various foods. Since that time, school feeding programs in general line with the recommendations of the Baguio Nutrition Committee have been developed in Singapore, Malaya, and Java.

Likewise, a Nutrition Conference held in Montevideo[2] in July, 1948, emphasized the urgent need for improving the nutrition of school children in Latin America. In most of the countries in Central and South America, malnutrition is prevalent among this age group and the Conference recognized that one of the best methods of controlling it is through the provision of school meals. It recommended that countries not at present in a position to organize a full service of school meals, should supply, temporarily at least, a simple "snack" which might consist of a glass of milk and "enriched" crackers. It also drew attention to the value of developing school gardens and orchards cultivated by the children.

Progress in implementing the recommendations of these conferences is being followed by FAO, and where necessary technical advice is being furnished.

Aside from this rather long-term program, FAO has been coöperating with other United Nations Organizations to further supplementary feeding projects in various countries where suffering and need are particularly acute.

In establishing the United Nations' International Children's Emergency Fund (UNICEF) in December, 1946, the General Assembly decreed that the staff and facilities of the specialized agencies should be utilized to the maximum extent feasible in order to reduce the personnel requirements of the Fund. It was in line with this decree that FAO and the Interim Commission of the World Health Organization convened a Joint Committee on Child Nutrition to advise UNICEF.[3] This Committee, composed of pediatricians and nutrition experts from various countries, met in Washington in July, 1947. In considering the foods which should be supplied by UNICEF to provide the greatest amounts of protein and other nutrients known to be generally lacking in the diets of pregnant and nursing women and children of all ages, special emphasis was given to dried skim milk. The recommendations of the Committee have been followed closely by the Fund

in developing its programs in various countries.

Since that time the Nutrition Division of FAO has given technical assistance to UNICEF in matters relating to nutrition and practical feeding programs. The work has been done both at headquarters and in the field. It has included advice to the Fund from the point of view of "nutritional economy," about the purchase as well as the use of foods for large-scale feeding programs for children and mothers. In Europe, the FAO Regional Nutritional Representative has acted as Chief Nutrition Consultant to the Fund in Europe. In visiting the various countries where the Fund is operating, he has assisted in the development of feeding programs. Another FAO staff member, attached to the Ministry of Coordination in Greece to establish nutrition services in that country, has helped to organize UNICEF's program there.

In Europe, attention has also been given to a program for making available a greater supply of indigenous milk of good quality for children. This milk is needed to replace the supply now being provided by UNICEF. A joint FAO/UNICEF field survey made in 1948 indicated a need for expanding pasteurizing plants and establishing milk drying plants, both of which would serve to increase the supplies of "safe" milk. UNICEF has been providing financial assistance and FAO technical aid to countries anxious to further such developments. Recent reports indicate that this scheme is progressing very favorably.

UNICEF activities have been extended to the Far East. Through the Nutrition Division, FAO has assisted the secretariat of UNICEF in establishing the basis of a satisfactory supplementary feeding program for countries in this region. During the past winter a staff member of the Division spent several weeks in the Philippines assisting with the organization of a demonstration child feeding program there. It is anticipated that similar UNICEF programs may be initiated in other countries in the Far East. Although only a very limited number of children may be included in them, it is felt that they will serve a useful purpose in demonstrating the value of school feeding and encouraging the development of this method of safeguarding the health of children.

Plans are now being worked out for UNICEF programs in Latin America where the need for practical programs to help combat the widely prevalent undernutrition and malnutrition is very great. It is hoped that some of the funds which UNICEF has allocated for work in Latin America will be devoted to demonstration child feeding and local milk improvement programs. Through its Nutrition and Agriculture Divisions, FAO will coöperate closely with UNICEF in carrying out these programs.

Despite the improvements which have taken place since the end of the war with respect to food and nutrition conditions, the world is still faced with serious problems. It is estimated that the world supply of foodstuffs in 1948–1949 is about 5 per cent above the pre-war average and at least 10 per cent above that of 1947–1948. But with the increase in population which has occurred in the last 10 years (an average of 20 million people each year), there is still less food available per head of the population than in the pre-war period.

Apart from long-range programs for expanding agriculture and trade in foodstuffs, one of the most effective methods which can be used to improve the state of nutrition of a population is the encouragement of supplementary feeding programs for the vulnerable groups—children from infancy through ado-

lescence, as well as pregnant and nursing women. The need for such programs exists, not only in poor and undernourished countries, but also in countries in which the available food supplies appear to be adequate. Even in the latter case, inequalities in food distribution, due to economic factors and poor food habits, may prevent large sections of the population from obtaining a satisfactory diet. The establishment of rational feeding programs in any country should be based on a thorough knowledge of the food supply and food habits of the people, as well as the nutrition situation such as can be gained by diet surveys and assessments of nutritional status. The close collaboration of administrators in the fields of agriculture, nutrition, and medicine is needed if children throughout the world are to have their rightful share of health—and happiness.

"Peace Hath Its Victories"

"The Tennessee Valley Authority has been able to announce at the end of its fifteenth annual survey of the reservoir areas that no positive tests for malaria were found. Blood tests were made from 4,300 individuals in areas where positive tests and even high incidence had previously been shown. Every one was negative.

"This does not mean, as was carefully explained, that the scourge of malaria has completely disappeared from the area under TVA control. It does mean that in one generation it has ceased to be a determining factor in the life of the community. The same type of testing, fifteen years ago, showed almost a third positive. In some regions it was two-thirds. That could mean only that malaria, with all its debilitating effects, was endemic in the area. Each year the tests showed substantial gains. For the last four the discovered incidence has been less than one per cent. This year the test is dramatically and completely negative.

"Several factors have been at work to change the complexion of eastern Tennessee. The establishment of the State University at Knoxville brought in outside influences and changed modes of thinking. The whole program of TVA brought in different relationships of employment and gain and different possibilities in agriculture. The installation at Oak Ridge again brought in powerful influences to bear on these communities. It is easy, now, to see in this region the effects of increased purchasing power, of improved farming methods, of raised living standards.

"No other one thing, however, can better illustrate what has happened than this conquest of malaria. A community in which one-third suffers from the disease and its effects is a vastly different place from one in which the complaint is unknown. There is a different tempo in living, a different outlook on life. Malaria is an aspect of human misery and its conquest is a victory over unhappiness.

"What has been done by TVA in this field is an illustration of what is possible when scientific knowledge and determination are put to the great uses of peace. Life is enriched and progress is furthered. It is small wonder that the TVA program of malaria control has been made a model for similar efforts in other countries. It can serve also as an encouragement to us in other activities."

The Health Officer and His Staff Receive the Foreign Visitor*

HENRY R. O'BRIEN, M.D., F.A.P.H.A.

Chief, Educational Programs Branch, Office of International Health Relations, U. S. Public Health Service, Washington, D. C.

A CITY set upon a hill cannot hide," someone observed long ago. Today, from nearly every country in the world, people are coming to the United States to study and to observe, to learn our ways of doing things. Last year our colleges and universities registered more than 26,000 foreign students. Industrial leaders from Europe—management and labor alike—come here to study our industrial methods.

Our field of public health is no exception. The nine approved schools of public health last year had 170 full-time students from other countries. This does not include students in public health nursing or in sanitary engineering, aside from those in schools of public health. The International Health Division of the Rockefeller Foundation gave 50 fellowships in 19 countries; the Institute of Inter-American Affairs, 35. Our own office in the Public Health Service had 70 fellows from Latin America, the Philippines, Greece, Germany, and Austria. The World Health Organization sent 183 of its fellows to the United States. Literally a score of other organizations in this country are offering fellowships to health workers abroad. Many governments are themselves sending people here for training in public health: India, Siam, Syria, Egypt, Liberia are examples. Each year the numbers grow. The totals are not large in themselves but the individuals are important to the future development of public health in their native lands.

Whether these people are entered in universities or spend a shorter time in travel, sooner or later the great majority come to a health department to see how it does its work. State and local departments should plan to take care of them. It is because such visits are of great interest to the foreign and the local health worker alike and because their numbers are growing that this article is written. We need to study the problem in order to make these visits truly valuable experiences for both sides.

Lest it be thought that I speak with the lofty detachment sometimes ascribed to Washington, let me explain that I served a decade in Lorain County, Ohio, and Cattaraugus County, New York, to both of which foreign visitors came, and I have worked in state departments in Albany and Hartford. In Washington, our office now sees 300 foreign health workers a year, referred by foundations, embassies, and the World Health Organization.

As of June 30 there were reported to be 1,291 full-time local departments of health in this country. Add the 48 states, any number of districts and some territories, and a substantial number of health officers with their staffs may soon be entertaining foreign visitors.

It is seldom, we hope, that the visitor descends upon the health officer un-

* Presented before the Health Officers Section of the American Public Health Association at the Seventy-seventh Annual Meeting in New York, N. Y., October 25, 1949.

awares. It sometimes happens, however, as in the case of a medical officer of health of Singapore who received an American physician who walked unannounced through the office door, took him to see some most ingenious antilarval drainage, and invited the physician and his wife home for tea. Most of us, however, learn of projected visits beforehand. With rare exceptions the foreign visitor is sponsored by some agency, which has given him a fellowship or which is arranging his program.

Our own office in the Public Health Service now makes the field arrangements for its own fellows, those of the United Nations (in the field of health), of the World Health Organization, and of various foreign governments. The Institute of Inter-American Affairs handles its own fellows and visitors from certain of the other American republics. The Rockefeller and Kellogg Foundations take care of their own grantees. The great majority of foreign visitors come through these four agencies.

All state departments of health should consider designating one of the staff to receive foreign visitors and arrange programs within the state. Otherwise a letter may go to the state health officer himself. Approach to certain large cities may be direct.

Whatever the channel, the health officer receives the inquiry—can he receive Mr. Foreign Visitor? This inquiry should come well before the proposed visit. Only a few large offices can receive visitors with a day's notice. For most departments the question should be raised one, two, or three weeks in advance. If the visitor is to have inservice training, arrangements should be made from one to three months ahead.

When Mr. Health Officer opens the letter asking him to accept someone from abroad he should find there certain definite information. His name, his country, his position there, his fields of interest, when it is planned to have him come, how long he can stay—how good is his English—these are a minimum. It is interesting to know, too, where he graduated in medicine, nursing, or some other field, and his experiences between graduation and his present work. These save questions later and may suggest interesting contacts.

To a letter of inquiry Mr. Health Officer usually replies that he will be glad to receive Mr. Visitor. But if the health officer and his staff are pressed with work, or have had many visitors recently, or illness or vacations interfere, or other situations obtain, it is certainly appropriate to decline.

Once the visitor is accepted, what plans should be made for his coming? Aside from a general discussion, should a detailed program be made beforehand? There are marked differences of opinion on this point among those who receive visitors. Some prepare itemized schedules days before. The visitor, it is understood, will arrive at 8:30 of a certain Monday morning. At 9:00, it is then planned, he will pay an introductory call on the health officer, at 11:00 he will be taken to another office, etc. All concerned write this on their calendars and arrange their other appointments accordingly. Nurses particularly are inclined to this procedure; and perhaps because they are accustomed to rather exact schedules, it works fairly well with them.

Others have had chastening experiences, especially with physicians. Our own slavish regard for the clock and the calendar does not obtain in every land from which our visitors may come. At the last place visited there may have been something of special interest which called for a longer stay. Perhaps the visitor went sightseeing over the weekend, or fell ill, or his train was delayed. At any rate, Monday noon comes before he arrives, or late Monday afternoon, or Tuesday. One visitor who was scheduled to spend two weeks with a certain de-

partment arrived on Friday afternoon of the second week. This is unusual, but many scheduled visitors are not found on the steps when the office is unlocked Monday morning.

The first conversation often reveals that the visitor has some additional interests that were not mentioned in the letter about him, or that he places special emphasis on certain points. Some health officers therefore prefer to wait until the visitor's arrival before making other than general plans. Then, on the basis of the letter from the sponsor, the interests and the emphases the visitor himself reveals, and the health officer's own knowledge of public health and of the strong points of his department, a detailed program emerges. Time is sometimes lost before the visitor can then start on his schedule, it is true, but this is soon made up.

There are times, of course, when the visitor is a well known foreign health worker and is coming for only a day or two, for definite purposes. For him a schedule must be prepared beforehand, and it may be expected to work.

Someone is liable to ask how many appointments are best made for the visitor's day. It is our experience that four is usually the maximum number, two in the morning, two in the afternoon. If more than this number are scheduled, there is a possibility that one especially interesting appointment may run over; then, since there is no leeway, the visitor is late for the next appointment, and there is general inconvenience. If the ordinary visitor sees too many people in one day, his mind may become a bit saturated and confused. It is better to allow some time between appointments for him to think over and digest the conference just finished, make notes, study literature just received, or think ahead for the interview to come.

What, someone else asks, about the visitor with inadequate English: A man who is obviously competent at home may be struggling with poor English; he and his host are embarrassed, and frustration and annoyance may result. Fortunately, such a situation is encountered less and less often. More and more people around the world are studying English. The agencies which give fellowships are stressing the importance to the individual of a ready and understanding use of English. Better tests are being devised, and their use extended, for measuring the candidates' English. At that, not all visitors will be equally proficient. Some understand only slow speech, careful enunciation, simple wording and are aided by frequent reference to printed material.

Visits vary so in purpose, timing, and duration that generalizations are sometimes difficult. We ourselves plan a visit of general observation before the visitor enters a school of public health. For this a small or medium sized local health department is selected. It is intended that the visitor see the scope and working of American public health. He should watch what the health officer does, the public health nurse, the sanitarian, the laboratory worker, visit the various clinics, etc., all without reference to his specialty. He is getting a general picture which will be of great help to him in school.

The summer following his school session he will be paying attention to his own field. Instead of a succession of visits of from three to five days each, covering as many departments as possible, emphasis is now placed on a longer stay in one department, followed by shorter visits to a number of others, for comparison with the first. In the longer period, possibly of a month or more, it is usually advisable for the visitor to be put to work as an intern in the department.

The older visitor, here for from three to six months of travel, may well have a longer stay in one place, studying all the aspects of our procedures in his field; while shorter visits in several other de-

partments will enable him to make comparisons and enrich his experience. He cannot, however, visit too many places. Some years ago Dr. Robert Lambert, then of the Rockefeller Foundation, observed that after three months their fellows seldom saw anything new. The law of diminishing returns begins to operate.

Some visitors, not appreciating this, like to see a large number of places, gathering hotel labels, as it were. It is natural for one to ask of the health officer host, "Where else do *you* think I should go?" and suggestions accumulate. The wise health officer makes his suggestions to the sponsor, who will appreciate them. They may only confuse the visitor, to whom fields in the distance may seem still greener than the one about him.

A question that frequently comes up in the mind of the health officer is: "What entertaining should we do?" That is a natural and a proper question. People like to entertain. Those of us who have been abroad have happy memories of the receptions we met here and there. Yet only the occasional health officer is fortunate enough to have an entertainment account at his disposal. For most health workers it is a matter of drawing on personal funds already well obligated. Several suggestions seem in order. For one, it is not necessary to reach for the luncheon ticket; most visitors have comfortable travel accounts. Let any entertaining have a personal touch. The health officer may take the visitor to his Rotary or Kiwanis Club, which is pleasant for everyone. Most foreigners appreciate greatly an invitation to a home. One of my painful memories is the statement of a student about to leave that in a year in this country she had never been invited to an American home. She was not complaining; I had asked her a direct question. Fortunately, her experience is not typical. Though the departure of the household servant makes dinner parties sometimes difficult, an afternoon tea or an evening call is possible and pleasant. One visitor told with appreciation of evening bridge games in the home of his laboratory host. Our picnics seem to delight our foreign students. Both the informality of the occasion and the skill of the local staff in frying a hamburger are matters they long remember. Most field visits are made in summer, so that these are practical suggestions. A concert or a baseball game may appeal to your guest. Whatever entertaining is done, the amount expended is not significant but rather the friendliness shown.

The visitor may enjoy the special features of the region, such as beautiful scenery, apple orchards, cotton or wheat fields, but a businesslike visitor will not cut into working hours for side trips.

Many of our visitors have definite religious convictions and are accustomed to attend Catholic or Protestant services on Sunday. It was humbling to me to have an Indian Methodist say she would prefer no appointments on Good Friday. In entertaining it is sometimes well to remember Moslem or Hindu customs on pork or beef; a friendly inquiry does no harm and may prevent embarrassment.

The Committee on Friendly Relations with Foreign Students suggests that if the visitor is more than a short time in a place he be brought into contact not only with health workers in his own fields of interest, but also with other community activities. The home and farm bureaus in rural counties are examples. Does the community have a forum, or a discussion group? Some visitors are asked to speak before luncheon clubs or Sunday schools or high schools. These general glimpses of American life are valuable. A while ago a Chinese doctor was sent to study hospital administration in North Carolina. From letters we received later, both from him and from the local sponsor, it was evident that

both sides thoroughly enjoyed his visit.

It is more and more possible to send to a local department a group of two or three people with similar interests. This is practical and time-saving. In a larger group, however, unless it is carefully chosen, differences of interest may appear and be confusing. The seven member commission of the WHO studying VD practice in this country was carefully selected and has just completed a successful program, traveling together.

People sometimes ask: Why should we take the time to receive visitors? The answers are many. As scientists we want to share information with others. It is worth while, too, in our own interest. In the past we have relied on quarantine and distance to keep us free from major epidemics. Today, when students leave Manila on a Friday night and are in Washington for Sunday tea, distance and quarantine are not enough for our protection. To paraphrase Abraham Lincoln, this world cannot long remain half well, half sick. We must improve health conditions in sore spots anywhere. Each health department receiving a foreign visitor has an opportunity to help in the improvement of health in another country. If the sword of the warrior against disease is forged in the school of public health, it is sharpened in his field visits.

The door is now opening for some of our health workers to go abroad themselves, under Fulbright or WHO funds. They will then meet, as many of us have already met, the help and the hospitality of their foreign colleagues. Let us extend the same help here.

These health workers who have visited us are people of growing importance in their own countries. Today, there are increasing numbers of people in every country who have been here, who know our ways and like us. They often have great influence at home and appear at international meetings as delegates. There they understand our positions and coöperate with us. They are people whom you, or the health officer before you, helped to train and won as friends.

Thoughtful opinion in this country is increasingly convinced that in the world today we need friends and want them. The past decade has taught that lesson. Nowhere is coöperation and friendship easier than in the field of health. Whether we ourselves ever travel abroad or not, we have an opportunity to share in this. We can aid in the development of health work in foreign countries or in places so distant that we have heard little of them since school days. We can win friends from far away for our country. We can broaden our own horizons and help safeguard the future for our children. This is the opportunity that opens when health officers and their staff prepare to receive the foreign visitor.

Accident-Proneness: A Critique

E. RICHARD WEINERMAN, M.D., M.P.H.
School of Public Health, University of California, Berkeley, Calif.

THE concept of "accident-proneness" has been intensively discussed in the modern psychoanalytic literature. Its appearance in a recent editorial in the *American Journal of Public Health*[1] and in a symposium in *Public Health Reports*[2] calls for critical analysis of the public health implications of this thesis.

As developed by Dunbar, Alexander, Rawson, and others, the concept of "accident - proneness" states that the majority of accidents occur as the result of *subconsciously intended* actions on the part of certain personality types. It is suggested that accidents are caused by deep-seated psychological conflicts in the individual, rather than by physiological or environmental conditions.

Accidents do not just happen

There is little doubt that accidents are only infrequently the result of pure chance. The emphasis given by the psychoanalysts to this point is a contribution of major importance. Accidents represent the interaction between man and his environment, when the condition of one or both of the interacting elements is such as to increase the probability of an untoward result. Assuredly, "accident-prone" individuals exist—but so do environmental safety hazards. It is as foolish to deny the contributory role of the environment as it is to deprecate that of the individual.

All accident-proneness is not psychological

All accident-prone individuals, however, are not necessarily characterized by personality disorders, as implied by the proponents of this thesis. Individuals who have unusual predilection for injury may reveal a vast number of pertinent *biological conditions*—such as fatigue, transient emotional stress with resultant inattention, impaired vision or hearing, underlying disease, etc. Moreover, the individual cases of carelessness and incompetence that may be psychologically determined, reflect immediate economic, social, or domestic pressures as well as complex psychopathology originating in early life. The first point is, then, that the accident-prone individual is not *always* a repressed or frustrated person who "subconsciously intends" the injury.

Environment plays a basic role

On the other hand, the insistence that most accidents are "caused" by neurotically motivated individuals relegates to a position of minor importance the role of environmental hazards. Accidents do reflect—and in wholesale manner—defects and inadequacies of industrial equipment, of housing, of traffic systems, of play areas, and of many other remediable conditions of daily life. This aspect of the accident problem is investigated in more detail below.

It is, then, the *overemphasis* upon hidden psychological motivation and the resultant minimizing (even when unintentional) of physiological and environmental factors which causes concern with the Dunbar-Alexander theory of accident-proneness. The overemphasis is not merely an inference. Alexander, in fact, states that "*most* accidents are unconsciously intended."[3] The A.P.H.A.

editorial summarizes this concept by stating that "the *vast majority* of accidents . . . are in a subtler sense determined by underlying trends of human personality."[1] (Italics added. E. R. W.) The entire event is transferred from the real world of persons and things to the disembodied arena of an individual mind.

Implications of the psychoanalytic concept

The dangerous consequence of this thesis is to restrict accident prevention efforts to the appraisal of personality types and the removal of "susceptible" individuals from the potential accident situation. Indeed, Alexander specifically states[3] that "the primary measures must be directed toward the person." He further states that since intensive psychoanalysis and psychotherapy would be the only effective means of handling such persons, and since these are impractical as mass measures, "recognition" and "removal" of designated individuals are the only feasible methods of accident prevention.

It *is* important to reassign workers who have a susceptibility to accidents to less hazardous jobs. This can be done only on the basis of careful records, and these should follow study of accident rates among the replacements. Safeguards must also be set up so that workers are not downgraded or fired under various pretexts related to this concept.

This procedure, however, is applicable only to a limited number of workers. It is by no means clear just how the supposedly accident-prone individuals in our society are to be removed from their involuntary contact with slum housing, icy pavements, drunken drivers, etc.—or even from their contact with difficult occupations in a period of job scarcity. The corollary of a concept that attributes most accidents to subconscious intention on the part of certain individuals is the relaxation of efforts to affect action of industrial managers, automobile manufacturers and used car dealers, city planners, housing authorities, and the like.

This shift of emphasis from environmental hazards to personality factors is fraught with social danger. A grim chapter in the history of the Industrial Revolution is that which deals with the crippling and killing of thousands of workers who were exposed to the unguarded machines, the condemned mine shafts, the ill-lighted sweatshops of the emerging factory system. One of the great social achievements of our time (still far from complete) is that of Workmen's Compensation legislation, which—after intense struggle—has taken the responsibility for occupational injuries off the back of the disabled worker and has placed it on the owner of the plant. Amazing progress in industrial hygiene and safety was stimulated directly by these laws. A reading of Dr. Dunbar's works on "accidentitis" makes one apprehensive lest some employers attempt to alter the current legal protections for the worker by introducing this personality concept as a new reason for the old practice of denying compensation. It would be a giant step backward if an injured worker's compensation were to be denied on the grounds that the accident was due to his "impetuous" and "resentful" personality, rather than to the complex of contributory causes.

Lack of proper evidence for the psychological entity

There is much more that is troublesome in this concept that "most" accidents are the result of unconscious behavior on the part of certain personality types. Proper scientific evidence for the existence of a specific psychological pattern seems to be lacking. As stated by King[4]:

> The finding that a relatively small percentage of the accident group is responsible for a high percentage of the total accidents does not constitute proof of the existence of accident

proneness as a clinical entity. It does not identify biological characteristics invariably associated with this special susceptibility, nor does it preclude the possibility of a greater exposure of the "accident prone" group to hazardous situations. The test of the hypothesis lies in the success or failure to identify causal physiological or psychological characteristics, or their combination, present in individuals showing a high frequency of accidents, and absent or present to a lesser degree in "accident free" individuals with a comparable background of experience.

Accidents as the result of multiple factors

A wealth of data is available to show the interdependence of many coexistent factors in the causation of accidents. The epidemiological approach of Gordon [5] stresses the complexity of factors—seasonal, demographic, genetic, biologic, geographic, etc., as well as psychologic. His conclusions are pertinent to this critique:

> That accidents and disease, as they affect groups of people, so frequently show similar distributions is no reason to assume identical causes; indeed, the expectation is that they are different. The illustrations presented here were purposely drawn from a wide variety of accidents and diseases, to the end of demonstrating that both great classes of morbid conditions of man are governed by broad biologic laws; that in their action on groups of people they are the resultant of the total forces within a universe, of an ecologic entity. . . . A wide range of conditions commonly contributes to the prevalence of an injury.

The time trends and statistical distributions of available accident data seem to support the conclusion that no single type of personality configuration can explain the majority of accidents. The National Safety Council [6] has reported that non-motor vehicle accidents have declined consistently since the turn of the century, while accidents due to motor vehicles have steadily increased in proportion with the greater number of vehicles in use and with the increasing congestion of traffic ways. Studies of occupational injury [7] constantly reveal that certain industries (e.g., mining, lumber, construction) have significantly high accident rates. The overall accident rate in industry dropped steadily from 1936 to 1941, but then rose abruptly as conditions of wartime production developed.[8] This change was attributed to such factors as fewer replacements of parts, crowding of equipment, unsafe wearing apparel, fatigue, new unskilled workers, and the like. Another report [6] showed that the rate of occupational injuries increased disproportionately as the length of the working day exceeded the standard of eight hours. A survey by the Travelers' Insurance Company indicated that three-fourths of all cars involved in accidents had serious defects involving headlights, tires, brakes, etc. Brittén [9] has analyzed National Health Survey data to show the inverse relationship between rental value of housing and home accident rates. (This invites attention to the "proneness" of the substandard housing environment as far as accidents are concerned.) It is difficult to reconcile the thesis of psychologically determined accident-proneness with such diversified environmental relationships as these studies demonstrate.

This tendency of psychoanalysts to attribute universality to observations made in circumscribed situations is well scored in a recent psychiatric review [10]:

> A dominant defect of the Freudian psychoanalytic discipline is to take or mistake a part for the whole, unwarrantedly to assert that a complex or a number of complexes, which may or may not be present, are causative in human behavior.

"Accidentitis" would seem, then, to be a poor resolution for the diverse problems of mine cave-ins, inadequate fireproofing, impaired and uncorrected vision, etc. Neither submerged guilt complexes nor overly compulsive behavior reactions are sufficient explanation for the high incidence of accidents among workers exhausted by production speed-up or among children forced to the streets for play space. The psychoana-

lytic explanation is inferior to the biologic when the excessive accident rate in the very young and very old is analyzed. One wonders if the studies of truck drivers (which show that a relatively few drivers were responsible for a large proportion of the accidents) carefully examined the distribution of these individuals according to types of routes covered, amount of night driving, unrelieved hours on the road, etc.—*before* concluding that personality type (sic) was the decisive factor. Individual case histories —however dramatically presented—are inadequate substitutes for painstaking analysis of accident data, which show accidents to be regularly concentrated in the hazardous occupations, congested roadways, and substandard dwelling places. Is it to be assumed that the so-called accident-prone personality type has an affinity for these particular surroundings?

CONCLUSIONS

An accident is the result of undesired and unanticipated—but preconditioned —interaction between the individual and his environment. Psychological motivations undeniably contribute to accidental occurrences. It is, however, essential that we continue to emphasize social control of the hazardous environment, correction of physical and mental impairments, and education for safety. To depend primarily upon detection and removal (or psychoanalysis) of particular personality configurations is neither warranted nor wise in light of the incomplete state of our present knowledge of accident-prone behavior patterns. There is serious need for statistically sound and scientifically convincing data to test the psychoanalytic theory. Until proof of accident-proneness is produced from study of mass accident distributions—and not only from intensive analysis of individual cases—the factors in accident prevention which *do* have a scientific basis must not be displaced. As in any experimental work, the theory must be subjected to the most rigorous tests before it can be generally accepted. As it is now presented, the "accident-prone" concept leads to defeatism and ultimately to reactionism in such fields as social insurance, industrial hygiene, housing, and city planning.

Successful accident prevention must recognize the *total* ecologic complex. "Proneness" to accident is at once an attribute of the disturbed personality, the impaired physiology, and the unsafe conditions of environment.

Engineering Aspects of Home Accident Prevention*

FREDERICK S. KENT, M.P.H., F.A.P.H.A.

S. A. Sanitary Engineer, Federal Security Agency, Public Health Service, Division of Sanitation, Washington, D. C.

THE problem of home accidents is a blind spot in the eyes of health agencies. Long ago the public health agencies could have taken the initiative in the prevention of home accidents because of their close relationship with the individual and his home environment. Accident prevention is within the scope of the public health objectives of preventing disease, prolonging life, and promoting physical and mental efficiency and well-being. Since public health personnel are trained in the fundamentals of controlling or eliminating health hazards, they can readily adapt these principles to home accident prevention.

The present incidence and prevalence of home accidents challenge every effort for their control. Accident facts for 1948 [1] released by the National Safety Council indicate that approximately 98,000 persons were killed in all types of accidents and 10,300,000 received disabling injuries, of which 370,000 resulted in some permanent impairments. The cost in salaries lost, increase in insurance overhead, medical care, etc., was estimated at $7,400,000,000 for the year.

As a cause of death, accidents rank fourth in the United States, exceeded only by heart disease, cancer, and cerebrovascular diseases. Viewed strictly from the effect on the national economy, however, accidents form the leading cause of death. This was illustrated by Dr. Frank G. Dickinson,[2] Director of the Bureau of Medical Economic Research, American Medical Association. Using as measures the years of life expectancy lost and productive years lost, he showed that accidents have become economically more significant than heart disease, cancer, and the cerebrovascular diseases, which are primarily degenerative diseases.

Although the death rate for accidents in 1948 of 67.1 per 100,000 population was the lowest recorded in the years for which records are available, home accidents alone, of all categories of accidents, showed an increase. Up to 1947, motor vehicle accidents were the leading cause of accidental deaths. In 1947, and again in 1948, home accidents had become the number one killer in the accident field. In 1947 approximately 1,800 more persons were killed in the home than were killed on the streets and highways of this nation. In 1948 this differential increased to 3,000.

Home accidents alone rank as the ninth leading cause of death with 35,000 deaths. Add to this figure the approximate 5,250,000 persons injured—or over one-half of all accidental injuries and include the 140,000 who suffered permanent impairments. Then we realize we are faced with a most serious problem, one which cannot be met by any one professional group in the health field. It is a challenge to every health depart-

* Presented before the Engineering Section of the American Public Health Association at the Seventy-seventh Annual Meeting in New York, N. Y., October 26, 1949.

ment and will require the services of the entire staff. Only by coördinating all our efforts can we show progress in the reduction of morbidity and mortality due to home accidents. Public health engineers, especially, have an opportunity to play again a leading role in the control of a serious health hazard comparable to the one played in the control of malaria and typhoid fever.

Basic causes of accidents can be classified under two major headings: those related to environmental factors and those involving human factors. They frequently result from the combination of environmental hazards and human errors. This intermingling of environmental with human factors makes it difficult to separate them and assign a primary significance to one and a contributing role to the other. A factor which adds to this difficulty of separation, and one which every investigator should recognize, is that human errors are often made glaringly evident by the accidents while coexistent environmental hazards are overlooked or considered too unimportant to be reported. Accidents may be prevented by the control of either human or environmental factors. We can help to attain ideal safety by the maximum practicable reduction or elimination of every environmental hazard. We may consider the engineering problem as one of creating a "fool-proof" environment which will make it easier for an individual to learn and practise only safe habits.

The Kansas State Board of Health and the Nassau County Department of Health[3] have conducted studies of accident fatalities over a period of years. The report forms used were not designed primarily to collect information concerning unsafe acts and unsafe conditions contributing to accidents, but these contributing factors were considered worthy of mention, and were included in the reports: slippery floors, loose rugs or carpeting, dark or poorly lighted hallways, defective heating equipment, and insecurely fastened screens.

The National Health Survey findings[4] indicated that accidents in homes are frequently the result of specific hazards associated with dilapidation and other factors involved in poor housing, and that frequency of home accidents decreased as the rent or value increased. It is realized that rent is not a good measure of environmental hazards, but it does help to measure poor housing environment. A rather interesting finding showed a 70 per cent increase in the accident rate as rent declined from $30 or more per month to less than $10 per month in rented multiple dwelling units.

The Cook County Study,[5] limited by nature of study to families in the lowest income group, showed that both mechanical and personal factors were included in approximately 64 per cent of the home accidents.

The Kansas and Nassau statistical studies indicated that 60 per cent of the fatal home accidents were due to falls, with falls on the same level exceeding falls from one level to another. Fire caused 14 per cent of the fatalities; 10 per cent were due to suffocation or strangulation; poisoning by gas, poisoning by liquids or solids, death from firearms, and drowning exceeded 2 per cent. In studying accident sites, it was found that the most dangerous place in the home was the bedroom where 32 per cent of the accidents occurred. The second most dangerous place was the yard with 14 per cent of the fatalities. Inside and outside stairs together accounted for 13 per cent. The kitchen, living room, and bathroom followed in that order.

From the above studies, it appears that engineers can direct their efforts in home accident prevention into two main channels. One is the reduction or elimination of hazards either built into the home in the planning, design, and construction of the structure or added

thereto by the householder. The other is the control of hazards associated with the construction, installation, and operation of household appliances and equipment.

Home accidents due to collapse of a structure are few and far between and fade in significance when studied in relation to the contribution to accidental injury and death from specifically dangerous areas within the home. It has been agreed by eminent architects that it is as easy to build hazards out of, as into, a home. Stairs can be designed with treads of equal width, risers of equal height, a sturdy handrail, and a gentle slope so as to minimize falls; yet the householder by adding a torn rug or an insecurely fastened covering, can immediately make this stairway a hazard. Fireproof or fire stopping construction can localize fires. Electric outlets can be placed so that the chances of electrocution or burns are reduced, especially in bathrooms, laundry rooms, or wherever we have the combination of electricity and water. The design of sunken rooms with a half or full step between rooms presents a dangerous tripping hazard.

Household appliances and equipment have made household tasks easier and less wearing, but have, on the other hand, increased the exposure to new hazards. Careless operation of a gas range can convert it into a deadly weapon. Failure to provide a relief valve on a hot water boiler in a home in Detroit converted the boiler into a rocket which smashed through two stories of the home and landed a half block away.

Several hours could be spent in enumerating and illustrating the various environmental hazards in the home. Many are so simple that I need not expound them to a group of engineers, yet they continue to cause accidents to the householder who does not realize their danger or who considers that accidents always happen to the other fellow.

A comprehensive inspection form was developed recently as part of the Home Accident Demonstration Project in Kalamazoo, Mich. In this form, environmental hazards are itemized and safety standards are presented in detail so that they can serve, not only to indicate environmental hazards, but to assist in educating the householder in the recognition of unsafe practices in the home. I hope all of you will take the opportunity of becoming familiar with this form.

Safety is not merely a concept or a label. It is a way of living, whether it be in the home, on the street, in the school, or in a place of employment. Industry has greatly reduced its accident rates and fatalities through engineering and education to the extent that 65 per cent of fatal accidents to our labor forces now occur outside the plant. It is not enough to practise safety within the place of employment and then forget it immediately upon leaving there. It must be a 24-hour-a-day habit. By concentrating our efforts on the prevention of home accidents, we can extend the period of safety consciousness of each individual.

Accident prevention is not a new activity in environmental sanitation. Actually we cover safety to a varying degree in the activities of almost every current program. For example, in making an inspection of a water purification plant or swimming pool, the location of the chlorination equipment in a separate room, with adequate ventilation and a readily available gas mask is recommended. In sewage treatment plants we condemn use of open flame where exposure to gas is evident. Fire hazards, improper equipment and appliances in food establishments are observed and corrections suggested. The list is extensive, yet safety has been relegated to a minor role in an inspection, and safety in the home has not even been considered.

I am not recommending that we curtail or drastically cut our current public

health activities to concentrate solely on home accidents. I do recommend that while we are collecting a water sample or answering a nuisance complaint—the health department services most familiar to the public—we might well offer to make a home safety survey since the chances of injury or death are far greater from accidents than from typhoid or any of the enteric diseases. The safety survey might also bring to the attention of the people the activities actually provided by a health department. I am suggesting that, in view of our morbidity and mortality statistics, we reëvaluate the significance of our activities in order to concentrate our programs and our major efforts on the most vital problems.

Home accident prevention should be included in the activities of every health department. The engineering program could encompass such activities as the following:

1. Coöperation with home builders, contractors, and architects in order to improve the planning, design, and construction of new dwellings or remodelling of old ones.
2. Provision for a home builders' counselling service to families planning to build or remodel.
3. Securing the coöperation of hardware dealers in explaining safe operation and maintenance of equipment to the householder before the equipment is used.
4. Working with dealers of household appliances and plumbers on proper installation of equipment to eliminate the hazards commonly resulting from improper installation.
5. Obtaining the coöperation of manufacturers of household appliances and equipment to make them fool-proof.
6. Offering voluntary inspection services of the entire premises for safety hazards to anyone desiring such services. The form mentioned previously could be used as a guide for such inspections.

More research is needed on circumstances of non-fatal, as well as fatal accidents. As research presents up-to-date information on the relative significance of the various environmental hazards in relation to their contribution to morbidity and mortality, emphasis on control can be varied accordingly. Meanwhile we can utilize the knowledge at hand to guide us. A housing program incorporating the American Public Health Association housing appraisal survey affords an opportunity to coördinate a study of environmental hazards and the prevalence of home accidents. A rat control survey presents still another opportunity to tie in an inspection of this nature.

Because safety is a way of living, it must become an integral part of people's lives. It cannot be forced onto a community, but must be stimulated and fostered by the service we can offer in creating a safe environment in order to make the safe way of living a reality.

A home accident prevention program can and must be based on a policy of service to every individual in the community. By putting this program into effect, we will be instrumental in reducing the currently increasing contribution of home accidents to our national morbidity and mortality.

Psychosomatic Approach to Venereal Disease Control*

Chronic Gonorrhea Repeaters

HERMAN N. BUNDESEN, M.D., F.A.P.H.A., FREDERICK PLOTKE, M.D., AND HENRY EISENBERG, M.D.

Senior Surgeon (R) (inactive) U.S.P.H.S., President, Chicago Board of Health; Venereal Disease Control Officer, Chicago Health Department, and Senior Surgeon (R) U.S.P.H.S. †

RECOGNIZING the social implications of venereal disease, many workers in the field have been interested in seeking precipitating causes in the backgrounds of the venereally infected, or in finding clues which would help in making the program of prevention more effective. The problem has been approached from different angles, but all particularly seek answers to the question, "What traits appear characteristic of those persons who seem prone to the sexual promiscuity which leads to venereal disease?"

Venereal disease is not exclusively a medical problem. Recently sociologists and psychologists have been invited by medical men to aid in finding more effective curbs on these dangerous, contagious diseases, by making an attempt to raise the standards of social responsibility of the public through a more adequate understanding of the role of sex in human dynamics. To achieve these multiple goals, adequate techniques need to be devised leading toward deepened understanding. This, it is hoped, may lead to more effective educational and control methods.

In the treatment of venereal disease, the mental attitude of the patient must be considered. In many patients, venereal infection stirs up feelings of shame and panic. All the social disapproval of the civilized environment is directed against them. Their mental attitude may include all the frustration, guilt, and confusion which reflect poorly organized ego ideals.

The manner in which the patient is handled may be an important factor in his subsequent life adjustment. It may determine which alternative the patient chooses, (a) to handle his sex life more adequately and efficiently in the future, with a corresponding rise in social responsibility, or (b) to continue to make mistakes, deal haphazardly with the important sex factor in his social adjustment, and undergo repeated infections.

The literature contains only scant reference to this problem. One of the most complete studies was made in 1945 by venereal disease control officers in the Royal Canadian Army.[1] The study showed that venereal disease patients were largely of an inferior personality type. It was the conclusion of Watts and Wilson that if a man gets venereal disease infections two or more times, it

is indicative of weakly organized personality, and the case should be thoroughly investigated by a psychologist or psychiatrist.

In a study made on fifty venereally infected female prisoners in England, venereal disease was recognized as a symptom of social maladjustment and psychiatric supervision or treatment suggested as a controlling factor in the prevention of further sexual promiscuity.[2] An interesting project undertaken at the San Francisco City Clinic in 1943 combined a psychiatric service with the city clinics in an effort to determine whether or not psychiatric help might be effective in diverting young women from venereally contagious situations.[3] It was felt that treatment and control potentialities might be better understood if a study of the characteristics of the patient was made. Three hundred and sixty-five women were referred to the Psychiatric Service where they were interviewed by psychiatrists and psychiatric case workers and given a psychological examination. A particular aim was to develop criteria for prognosis in good sexual adjustment and amenability to psychiatric treatment. Another study was made more recently in 1946 by Weitz and Rachlin at the Midwestern Medical Center at St. Louis, Mo.[4] With a staff of five psychologically trained workers, they made a psychological study of sexual promiscuity and venereal disease. Five hundred women patients in attendance at the clinic were observed and tests made over a 6 month period. Mental and educational retardation seemed commonly characteristic of the venereally infected group. The authors insist that the mental limitations of the average clinic patients be recognized and used to explain the usual difficulties met with, such as missed treatments,

TABLE 1

Showing Means for the Group of Fifty Gonorrheal Repeater Patients as to IQ's, Education and Age

Item	*No. Cases*	*Range*	*Mean*	*Median*
Intelligent Quotient	50	52–117	78.86	76.50
Age	50	20– 40	24 yr. 3 mo.	24
Education	50	4– 12	8 yr. 7 mo.	9

Range — describes the range in which the cases lie, showing maximum and minimum.

Mean — representing the average number for the entire group. This is found by dividing the total by the number of cases. This represents one sort of average, but should be compared with the median in most cases.

Median — representing the average derived by the individual who stands midway between the maximum and the minimum.

eased patients. It was proposed that the first project would be the evaluation of chronic gonorrhea repeaters, that is, those patients who had had three or more gonorrhea infections within one year. This group of patients averages 30 per cent of all patients found in Chicago infected with gonorrhea. It has long been noted that such patients when coming to observation appear to be of lower than average intelligence. In discussing sexual problems with the patients, it was evident that they did not have a proper appreciation of their situation. Some of these patients who had more than three gonorrhea infections per year were referred for psychological interviews. It was hoped that this method would ascertain at what level of intelligence the patient was functioning and what his traits and characteristics would be.

This preliminary report summarizes the first phase of this project. The results included herein have been obtained on a total of 50 male patients between the ages of 20 and 40. Only 10 per cent of this group were native Chicagoans; the remaining 90 per cent had been residents of Chicago for an average of about 4½ years.

A short mental examination was administered in conjunction with the Wechsler-Bellevue Intelligence Test, Form I, excluding the vocabulary test. The results have been tabulated in percentages, as it was felt that this would be the most efficient method of handling the data. Means for the age, intelligence quotients, and education have also been presented.

RESULTS

It was found that the average age of the gonorrhea repeater frequenting our Municipal Social Hygiene Clinic was 24 years, that on the average such repeaters had a grammar school education or better, but that their intelligence quotient was below the established average of 90 to 110. In 56 per cent of the cases there was evidence of abnormal childhood conditions, such as death of one or both parents before the age of 15, separation or divorce of parents. It is possible that these factors may have contributed to the transitory habits of these patients, causing them to leave home early and seek the bigger cities.

There was an even distribution of married and single subjects, but it is of interest that, of the married group, as high as 60 per cent were separated from their wives or reported difficulties in their marital relations. Even among those patients who claimed that marital relations were good, there was a high frequency of extra-marital contacts. Such poor adjustment to married life would appear to be evidence of personality deficiencies.

Sixty per cent of the patients served in military units during the war. They did not seem to have benefited from the educational features which were part of the venereal disease prevention program of military life. The majority of the group, whether single or separated from their wives, lived alone and were employed in some type of unskilled labor. Twenty-two per cent had been known to the police at some time.

The Wechsler-Bellevue Intelligence Test showed 74 per cent to have an intelligence quotient of less than 90, noted by Wechsler as the lower limit of the average group. The largest single group was in the defective class (32 per cent), with IQ's below 68. Twenty-six per cent of the gonorrhea repeater group of patients showed intelligence of the borderline defective variety. There were 16 per cent in the dull normal category (IQ's of 80–90) while but 22 per cent achieved intelligence quotients in the average class (see Table 5). The mean for 50 cases was 78.86 with a median of 76.50. Both these figures indicate intelligence of the borderline defective type.

These results apparently concur with those of other investigators. Watts and Wilson, in their study of the venereal disease patients in the Royal Canadian Army,[1] found 20 per cent of the group to be mentally retarded. There are certain selective factors present in choosing army personnel, and not many individuals of low mentality are admitted into military service. In this study also it was noted that 95 per cent of the group were emotionally or intellectually handicapped. In fact, they were largely of the personality type known as psychopathic personality, that is, persons who, though apparently normal, are psychologically unable to make sound social or moral judgments. In the study of Weitz and Rachlin at St. Louis, Mo.,[4] 32.6 per cent of the group of 500 venereally diseased female patients showed a mental deficiency which warranted protective institutional care. The results of the various studies are compared in Table 7.

An attempt was made to evaluate the test results on the Wechsler-Bellevue Intelligence Test according to Wechsler's clinical patterns.[5] It was discovered that in 44 per cent of the cases, the patterns of the patients' performance on test items concurred with the group described by Wechsler as Psychopathic Personality. Twenty-two per cent showed a tendency to personality maladjustment.

We felt it would be expedient to divide the clinic patients into three groups:

1. Those showing no evidence of any psychopathic traits or personality maladjustments
   a. Without mental retardation
   b. Showing some mental retardation
2. Those showing a tendency toward personality maladjustments
3. Those showing definite psychopathic traits.

Then further treatment could be adjusted in accordance with the category in which the patient was classified.

CONCLUSIONS

The clinical group of gonorrhea repeater patients is below the average in intelligence. For this reason, a different approach in the health education program for venereal disease prevention and control is indicated. It is questionable whether persons who are mentally retarded and who have psychopathic personalities learn by experience or are amenable to common sense advice. The aim should be to provide guidance and supervision for at least the mentally retarded, including psychotherapy, depending upon the patients' capacities. It is also important that the educational material distributed should be supervised and checked by psychiatric workers so that it will be within the intellectual level of the recipients.

It is felt that Group 3 with the present limitations in knowledge of the treatment of psychopathy as well as the scarcity of adequately trained professional personnel would not be the group most productive of good treatment results in large V.D. clinics. However, persons in Groups 1 and 2 can probably be salvaged and improved by the correct approach, thereby decreasing the reservoir of infection. If Groups 1 and 2 were further classified as to intellectual level, therapy could still further be individualized. Patients who show evidence of personality maladjustments (Group 2) and who are of average intelligence, are in need of individual psychotherapy, and can probably benefit from psychological help and guidance in their social adjustment, recognizing that their sexual promiscuity is symptomatic of some underlying personality disturbance. Patients in Group 2 who are of defective intelligence might receive more benefit from group psychotherapy, in which an understanding of the venereal preventive measures and simple solutions to personality problems can be presented to the group. The difficulty of securing qualified personnel for group psychotherapy is not to be minimized. Likewise with Group 1, those with higher intelligence would receive individual therapy;

those of lower intellectual endowment may be reached by group psychotherapy.

The assistance of psychiatrists, psychiatric case workers, and psychologists in venereal disease clinics should be encouraged, and they should generally be given a place in the treatment of venereally infected patients. It is believed that these workers are able to contribute largely to the efforts of the patients to rehabilitate themselves. Further studies have been planned to show the invaluable aid which can be given by the psychiatrist who should see almost every venereally infected person before or after the somatic disease has been treated. By using a psychosomatic approach to the problem, a more complete prevention program probably could be effected.

Johns Hopkins Reorganizes Medical Structure

According to an announcement recently made by President Detlev W. Bronk, President of Johns Hopkins University, Baltimore, the Johns Hopkins Hospital, Johns Hopkins University School of Medicine, and the School of Hygiene and Public Health, together with the Welch Medical Library will for the first time be combined under a single head to provide more effective integration of all medical activities.

Lowell J. Reed, Ph.D., who for the past three years has served as Vice-President of the University, in charge of medical affairs, has been named to become the administrative head to fill the newly created post of Vice-President of the Johns Hopkins University and Hospital. Dr. Reed currently is President of the American Public Health Association.

Among the common problems between the several institutions are a need for long-range financing, long-range planning of plant and facilities, joint research programs where there are common interests and common requirements of costly instruments and apparatus, and the medical care program which has been undertaken by the hospital.

Some Problems in the Recruitment and Training of Public Health Personnel*

L. E. BURNEY, M.D., F.A.P.H.A.

Secretary and Commissioner, Indiana State Board of Health, Indianapolis, Ind.

FEW, if any, will dispute the statement that the recruitment and training of personnel are probably the most urgent problems facing public health today. An adequate number of qualified personnel is required before we can improve and enlarge existing programs, develop new programs, and take full advantage of present public interest and support.

In a study made by the U. S. Public Health Service it was disclosed that a total of 2,587 positions remained unfilled in state health departments during the first six months of the fiscal year 1947–1948. A listing by professional classification of the unfilled positions is given in Table 1.

TABLE 1

Professional Classification	*Planned for 1947 Fiscal Year*	*Employed January 1, 1947*	*Positions Unfilled*
Total	*19,684*	*17,097*	*2,587*
Physicians	1,216	769	447
Nurses	2,138	1,747	391
Dentists	155	87	68
Sanitation personnel—	769	621	148
Engineers	1,451	1,247	204
Others	1,644	1,494	150
Laboratory Personnel	214	169	45
Health Educators	135	101	34
Nutritionists	167	132	35
Medical Social Workers	7,711	7,000	711
Clerical, administrative, and fiscal personnel	4,084	3,730	354
Others			

The shortage of medical and allied professional and technical personnel is not confined to the field of public health. Physicians, dentists, nurses, laboratory technicians, veterinarians, and other similar professional groups are greatly in demand for private practice, industry, federal and state governments, and hospitals. In securing information relative to our hospital licensing program we learned that, on the average, in hospitals under 100 beds, slightly over 50 per cent of the nursing care was provided by nonprofessional nurses. In hospitals over 100 beds, approximately one-third of the nursing care was given by nonprofessional nurses.

A major reason for the need for more public health personnel is the demand by the public for more public health services. As a result of the many technological advances of the last few years, the public has more time to interest itself in and make a study of such problems; and, in addition, has had more money to expend for such services. The accelerated interest of the last few Congresses bears this out, since the members of Congress reflect the attitude of their constituents back home.

* Presented at the 45th Annual Conference of Health Officers and Public Health Nurses, Lake Placid, N. Y., June 21, 1940.

This awakened awareness upon the part of the public of a need for better public health services and the demands upon us, both in old and new programs, make it essential—if we are to discharge our responsibilities effectively — to secure good personnel and train them for their particular positions.

RECRUITMENT

There is no panacea for the relief of the recruitment problem. A suggestion I have to make is that we recognize our competitors for professional personnel and do everything we can to match their offers. Highly remunerative private practice, demands by industry, the expanded medical and allied professional programs within the federal government, and the expansion of our own state and local public health programs keep the well dry. Every effort should be made to meet the compensation schedules of private practice, industry, and the federal government. The fine example established by New York, California, and one or two other states in securing salary levels commensurate with the training and experience involved—even though they still are inadequate—has been of tremendous help to those of us in other states. I seriously question whether we can ever compete with private practice and industry in the matter of compensation; therefore, we must play up to the fullest extent the other advantages of public health, which to me and to you must be more attractive than salary or we would not be here today. I refer to such factors as a retirement plan, vacation with pay, sick leave, slightly more regular hours, opportunities for graduate training, a little more freedom in determining the special field in which the individuals may be interested, opportunities for research within these fields, and the satisfaction of knowing that they have done their part in making the community a better place in which to live. However important salary may be to you as an individual, it is obvious that the best measure of your success is not to be found in your bank balance, but is best shown by your personal development and the good you do your fellow men. This is not a philosophical treatise, but your very presence here today indicates that there are compensations other than salary which attract people to the field of public health. It would seem to be advantageous to place more emphasis in recruitment on factors such as service and security.

Continued progress is dependent upon the understanding and support of the public. This support stems from confidence in our administration. Confidence is earned by the efficient service we give. Our usefulness in the future, therefore, is in direct proportion to the service provided every day in every year by everyone. This means good personnel.

Our success in meeting new programs effectively will be in direct proportion to our ability to discharge present responsibilities more thoroughly and satisfactorily. We are spread too thin now. There are inherent dangers to our future unless we make heroic efforts to consolidate and perfect as we expand. The farmer who buys too much land and the builder who constructs too many houses without sufficient equity soon have their mortgages called and bankruptcy follows. Neither we nor the public can afford such bankruptcy in health. Only by giving careful thought and planning to improve the present, can we build safely and well for the future.

Each year we accept new responsibilities without giving sufficient consideration to the ultimate effect on the total program. In the last few years special programs and categorical grants in cancer, mental health, dental health, industrial hygiene, and now looming on the horizon heart disease, diabetes, and rheumatic fever have deluged us before our basic foundation is adequately and

firmly established. Public health people can appreciate how enormous the task of holding back the sea must have appeared to the little Dutch boy who placed his finger in the hole in the dike. It is appreciated that we cannot and should not divert the interest of the public and our legislative bodies from some of the health problems that are becoming increasingly important. It is recognized that these so-called "new activities" will, and, by their nature should, become integral parts of a well organized and effectively administered health department. However, the question with which we are confronted is: Can the machinery, which admittedly is not adequate for a lesser job, stand the strain of additional activity?

Before the age of high speed rail travel came into its own, it was necessary for the railroad companies to survey their road beds and rolling stock in order to determine whether they could safely engage in such an endeavor. Old style engines were replaced, road beds were leveled, and rails were placed in line. Perhaps the job facing public health in the future is one of securing better engines, leveling the road beds, and lining up the rails.

Admitting that the present shortage of physicians and nurses presents an added handicap in the recruitment of these two classes of personnel, we may as well be realistic and acknowledge that the increased enrollment in our medical and nursing schools of itself will not aid us materially. There are certain qualifications that serve as keys to unlock the doors for more public health physicians and nurses.

I shall refer to physicians in my remarks, but the same factors apply to nurses. The first key is the understanding and respect of public health by the medical profession. Public health is still the red haired stepchild of medicine —not as much as five years ago, but still a stepchild. Public health is referred to as a specialty of medicine, but saying this and seeing it in print does not make it so in the minds of the vast majority of physicians, the teachers in our medical schools, and the medical students. The latter, of course, reflect the active or passive opinions of the two former groups. The recent development of the American Board of Preventive Medicine and Public Health is a well merited recognition of the importance of public health in the field of medicine.

The respect and aggressive support of the medical profession itself must be secured. Editorials and passive acceptance by the leaders are not sufficient. The medical profession should have the same high esteem for public health as it has for obstetrics, surgery, ear-nose-and-throat, and the other specialties. Ours is a more difficult product to sell. There is not the operating room glamour that is attached to surgery or the immediate, tangible, and satisfying results of obstetrics. Neither is there the financial compensation these other specialties may have to offer.

It is essential that these obstacles be recognized and understood if the effort to resolve them is to be successful. The medical student, quite naturally, is more interested in clinical medicine than public health. The clinicians are the glamour professors. They are big names in the state; their reputations are well known; and they have the surgical room or the delivery table to reinforce their didactic lectures with direct, tangible evidence of the contributions of their specialty to saving lives.

Did you ever hear of a professor of medicine discussing heart disease from the preventive as well as the curative viewpoint? Does the average surgeon present the public health aspects of cancer in his lectures or, if he has heard of cancer control, does he believe it has a real relation to the diagnosis and surgical treatment of cancer? How many obstetricians are concerned with pre-

mature care, the high rate caesarean sections in some hospitals, and services available to the expectant mother from various community agencies?

I do not blame the clinical professors. It is not their fault. They received no understanding of public health during their undergraduate days and they have been too busy keeping pace with modern medicine to learn what this young upstart, public health, is and how it concerns them as physicians and teachers. I believe most strongly, however, that until these clinicians do gain an understanding of public health—how it may supplement or complement their services, and why the diagnosis and treatment of a condition may be only one phase of a problem, why the teaching of preventive medicine is a vital part of any course to medical students—then, and only then, will medical students begin to think seriously of public health.

There should be closer integration among the various clinical teachers in planning their courses in order that the students may learn the problem of a disease as it affects the whole organism. Too often the diagnosis, treatment, prevention, and socio-economic factors are presented in a totally unrelated manner and at widely dispersed intervals. Cancer is discussed by the internist; then the radiologist has something to add, possibly six months later; then the pathologist; and, finally, the surgeon. The patient is presented in separate slices, as a loaf of bread. It is difficult for the students to see and understand the whole, as well as the separate parts.

Medical students will not be much concerned with public health until the clinicians, whom they revere, teach public health and preventive medicine as an important phase of their specialty. These clinicians will not teach it until they become interested and understand public health. Such interest and understanding will follow respect for the subject and the members of this specialty. Respect will follow if we do our work so well that the public and the profession cannot fail to take cognizance of the contributions that public health and preventive medicine have made and can offer in the future.

I have taken an undue amount of time to discuss this factor of respect but believe it is one of the most essential objectives toward which we must strive. We say we must have the best of physicians for health officers. I believe this. The work merits only the best. But we will have to admit that some of our health officers on all levels are not what we would like to have. Some are there because they are too old for private practice, others because they have some physical disability and they have heard that health officers lead an inactive life, and still others are available because they have not had the knowledge or perseverance to meet the stiff competition of private practice. This may be putting it too bluntly and may even be exaggerating the conditions a little to stress the point. I do not mean to say that an individual should be discounted in the field of public health because he is old, has some physical handicap, or dislikes private practice. But if these are the only reasons he has for coming into the field, public health will suffer. As hard up as Indiana is for health officers, I have turned down several physicians for a given position because they fell in one of the three categories previously mentioned. The job is too important to be done in a haphazard manner. If the respect of the public and the profession is to be attained, the surest way of success is to have only the best of personnel; the surest way to fail is to accept whatever personnel is available.

Another way of securing more physicians for public health is improved teaching in the departments of public health and preventive medicine of our medical schools. Some of these teachers

have little or no interest in public health; they do not have the proper background of training and experience; and, even more important, they do not have the fire and zeal to sell their product to a group of uninterested medics. Teachers "with a foolish glimmer in their eyes" who can take these skeptics "up on the mountain and show them the promised land" are needed.

There are some examples of teachers in public health who prove this contention. Many of you recall Dr. Waller S. Leathers,* a man with considerable experience in public health, and, in later years, Dean of the Medical School at Vanderbilt University. The State Health Officer of Tennessee states that while Dr. Leathers was dean, ten per cent of the graduates of every senior class went into public health work in Tennessee.

Contrast this with the number who go into public health from most of our medical schools today or with the recent experience of the U. S. Public Health Service in which only two of a class of young commissioned medical officers indicated any desire to perform public health duties.

The Indiana State Board of Health, fortunately, is located on the medical center campus of Indiana University. Many of the staff have teaching assignments with medical, nursing, and dental students. In addition, clinics with the senior class were established approximately three years ago in which small groups of seniors meet with most of our divisional chiefs, both for informal talks and field trips. This enables the students to become familiar with the staff of the State Board of Health; to learn what our ideas and objectives are; what services are available to them; and, in addition, it gives us an opportunity to mention their responsibilities and obligations to the community as well as to the individual patient.

This procedure has aided in a limited degree in securing better rapport with the undergraduates, but it is too late and too little. The students are too well indoctrinated with clinical medicine by that time to have much interest in public health. The teaching of public health should begin early in the medical curriculum. There should be opportunities for these undergraduates to work in local public health departments. Such "on the job" experience will enable them to secure a clearer picture of public health activities and to become aware that there are many resources available to the patient and the physician.

It has been noted, too, that in many instances, when senior students indicated an interest in public health, such interest was lost by the time they finished their clinical internship. This was due to lack of contact with public health during their intern year. The dean of our medical school has suggested the possibility of public health experience as a part of a rotating internship. This would be on a voluntary basis and might serve to crystallize the interest of a few physicians in public health. Provision has been made to provide the Indiana University Nursing School with a public health nurse to serve as a part of its teaching staff with the hope that this nurse will be able to inculcate an understanding of, and an interest in, a public health program for these undergraduate nurses.

Efforts may have to be directed beyond the professional schools in order to secure individuals who will desire to enter public health. Vocational guidance, especially in the small schools, should prove useful in our recruitment program. I mention small schools particularly since the youngsters in such schools do not have as much opportunity for contact with professional groups and with industrial organizations as their urban cousins. For example,

* Deceased 1946

rural Indiana provides most of the teachers for our state. An interest in health as a career can be stimulated through the use of films and literature and followed up with personal contacts where necessary. This early indoctrination of high school students, together with proper rapport with youth councilors, may encourage many high school youngsters upon entering college to choose nursing, medicine, or one of the other professional fields with the ultimate objective of doing public health work.

The idea of going to university underclassmen for recruitment is proving effective in our sanitarian classification. A course leading to the degree of Bachelor of Science in Public Health has been established at Indiana University. The first three years of the course are given on the university campus and the last year at the medical center. The class is necessarily small and is recruited from a large number of interested underclassmen so that considerable selection is possible. The first such class of five men has just been graduated. They are especially fine men and were able to secure good positions at once in local and state health programs.

INTERESTING PEOPLE IN A CAREER IN PUBLIC HEALTH

What kind of people do we want in public health? It is essential to have not just physicians, engineers, and nurses, but "doers," teachers, aggressive and dynamic leaders with plenty of zest and enthusiasm. They must like people, enjoy working with people, and have an unusual amount of patience, tolerance, and perseverance. A desire for wealth automatically eliminates a career in public health—one just does not acquire that kind of money in public health.

Character and integrity are two essential traits for which no amount of training and experience can substitute. Loyalty, dependability, reasonableness, and plain common sense are additional assets to look for in our personnel. Absence of any or most of these characteristics is, in my opinion, sufficient grounds for refusing employment. Individuals without these cardinal traits will do more harm to public health than having the positions remain vacant.

The confidence and support of the public are founded upon their contacts with the individual worker in his or her daily routine. That is why extreme care must be exercised in the selection of these individuals. Everyone in public health needs to be a little bit of a missionary, a teacher, a salesman, and must have the patience of Job and the tolerance of Socrates.

TRAINING

All of us are guild conscious. This reflects itself in several ways. One example is the difficulty in securing an interest by the various professional groups in each other's programs. The engineer sees environmental sanitation but not chronic disease or bedside nursing. The physician does not see that he has a part in stream pollution or dairy programs. And so on through the other professional groups. One of my greatest concerns as an administrator is this lack of interest in and an understanding of three points by the personnel:

1. The overall objectives of the state or local program
2. The responsibility of each specialty to the whole program
3. The problems of public health outside the individual's own specialty

These are not easy objectives to achieve. The medical administrator has been largely to blame for lack of cohesion, and upon him lies the greatest responsibility for eliminating this stumbling block.

I believe strongly in staff meetings of all personnel—professional, technical, and clerical. Our program directors meet every two weeks. Points of general interest and concern are presented, and each

division chief has an opportunity to note problems that occurred in his program. Once a month, meetings are held for the entire staff.

Several months ago, one of our restaurant sanitarians was discussing a proposed ordinance before a city council. This led into a discussion of full-time health departments, but our sanitarian could not give detailed information on permissive legislation for the establishment of such departments. I firmly believe that the members of each professional group must have a working knowledge of the objectives and fundamentals of every other group. We cannot remain autonomous units under one administrative head if we are to succeed in improving public health in general.

Through the assistance of Indiana University, ten-hour courses in leadership and supervision are given at intervals to both professional and clerical employees. Inservice training, in my opinion, is more vital than preservice training. Individuals are more receptive and the discussions are more objective. Some of the objectives kept in mind in such inservice training programs are the following:

1. Review of facts already known for the benefit of everyone—providing a broader base for each individual.
2. Provide information to enable all to keep on top or ahead of new programs.
3. Instill an interest in fields other than own specialty.
4. Provide basic facts for securing an interest in other social problems of a community, such as education, welfare, recreation. (This is included with the thought that if we expect individuals in fields other than health to have an interest in our program, we, in turn, must demonstrate an interest in and an understanding of their problems.)
5. Evaluate objectives from time to time, together with the methods and techniques for attaining these objectives. The criteria of evaluation should be not that of numbers alone but of actual accomplishment.

USE OF AUXILIARY PERSONNEL

"Necessity is the mother of invention." Perhaps our inability to secure certain types of personnel, especially physicians and nurses, will lead us to make wider and more effective use of auxiliary groups. I believe there is a place for lay administrators in public health. They would serve as business managers or executive assistants. Their use in state health departments has increased in the last few years. Justification exists for their utilization in large local health departments to relieve the health officer of certain administrative details and allow him and his medical staff to use their training and skills where they will be most effective.

Practical nurses and nursing aids—or whatever name is finally given to nonprofessional nursing assistants—have been utilized effectively in hospital programs. There should be a place in public health for such individuals, especially where a bedside nursing service is a part of public health nursing. Sanitarians in environmental sanitation, dairy, and food programs have definitely found their niche in public health and are doing effectively what, in some instances, was being performed only by engineers a few years ago. If we do believe that such auxiliary personnel have a place in public health, we will have to provide training for them in order that their greatest usefulness can be realized.

CONCLUSION

If there is one answer to the recruitment of personnel for public health programs, it is to do better in our present everyday tasks. Nothing succeeds so well as success. Using our present knowledge and skills to their greatest efficiency will bring success. This, in turn, will bring with it respect and good personnel.

Progress is not accomplished overnight. There will be no clamoring at our doors tomorrow or the next day by worthy applicants. Aggressive leadership, sound planning, and hard work by

everyone are the answers. Remember Pasteur's statement, "They will tell you to try to prove that you are right; I tell you to try to prove that you are wrong." Let us beware of complacency. Let us see the wisdom of continual evaluation of our objectives, our methods, and our techniques. Let us work together, each with his special skills and experiences pooled for the common objective of improving the health of all the people.

Increased compensation, better personnel practices, sound teaching methods in the undergraduate and graduate professional schools, and training centers in good local health departments are adjuncts in our programs of recruitment and training to the main problem of doing today's job a little better. I am not concerned about the future if the present is successfully managed.

In the words of Carlyle, "Our main business is not to see what lies dimly at a distance but to do what lies clearly at hand."

Committee on the Hygiene of Housing

At a meeting of the Committee on the Hygiene of Housing, held in New York on October 29 and 30, it was reported that the third and final volume of manuals for the Appraisal of the Quality of Housing (dealing with the environment of the home) is in page proof and will shortly be available.[1] The entire appraisal procedure has now been endorsed by the U. S. Public Health Service which is sponsoring the use of the method and is prepared to train local health department personnel in its use (at Atlanta or in areas where special demand exists).

A final draft of Volume II of the Committee's Standards for Healthful Housing, dealing with Planning the Home for Occupancy, was approved for publication and should be available by the first of the year.[2] In this report, minimum space standards essential for healthful living are for the first time developed on the basis of the functional needs of the household; and the results, according to the Chairman, offer a direct challenge to the inadequate housing facilities now often provided under the guise of a false and delusive "economy." Volume III of this series, on the Construction and Equipment of the Home, should be completed during the first half of 1950. In the same period a draft of a standard code of housing regulations, which is being prepared under the leadership of Dr. Edward R. Krumbiegel of Milwaukee, should be ready for publication.

The committee also outlined a program for a series of special research projects, to be undertaken if additional funds can be secured. These projects include: a systematic check and evaluation of the appraisal procedure, to identify its most significant items, with regard to possible simplification; a study of the hygienic and social results of the re-housing of slum populations; and the preparation of a monograph on Housing for the Aged and the Infirm, a subject of major importance, and one which has so far been neglected in this country.

The Inadequacy of Routine Reporting of Fetal Deaths*

As Evidenced by a Comparison of Such Reporting with Maternity Cases Paid for under the Emergency Maternity and Infant Care (EMIC) Program

LEONA BAUMGARTNER, M.D., F.A.P.H.A., HELEN M. WALLACE, M.D., F.A.P.H.A., EVA LANDSBERG, M.D., AND VIVIAN PESSIN

Department of Health of the City of New York

PUBLIC health workers for many years have been greatly concerned with the reduction of infant mortality. Important as such reductions are, it is becoming increasingly clear that the saving of lives lost *after* birth is only part of the problem of preventing loss of life in this period. Thousands of prospective lives are lost each year through deaths of viable infants born at or near termination of pregnancy, representing a tremendous wastage of pregnancy. For example, in 1947 the number of infant deaths (i.e., deaths within the first year of life) reported in New York City was 4,517, while the number of fetal deaths reported was 14,077. Bringing a larger number of these fetuses to a later stage of pregnancy enhances the chances for a live birth. More and more, then, it becomes important to focus on the problem of fetal deaths.

Before attacking the problem, one has to know the extent of it. Many attempts have been made in different countries and within the United States to obtain registration of fetal deaths. There is a lack of uniformity of the definition of the term "fetal death" in the literature, with variations in length of gestation, signs of life, and period allowed for registration of the fetal death. The indiscriminate use of the terms "stillbirth," "abortion," "miscarriage," and "fetal death" has added to the already existing confusion. For example, the minimum period of gestation after which a stillbirth must be reported is 28 weeks in England and Wales, 24 weeks in Belgium and Switzerland, 26 weeks in Czechoslovakia, 32 weeks in Norway, 29 weeks in Denmark, 16 weeks in Japan, and is not specified in France, Italy, and Belgium.[1] In the United States, there is similar variation from state to state. There is likewise no agreement regarding evidence of life. The following terms are loosely used—"any sign of life," "signs of life," "sign of breathing," "breathed or any sign of life," "action of heart, breathing or movement of voluntary muscle."

Several countries consider a "stillbirth" a child born alive but dying within the period of registration, meaning the lapse of time between birth of a living child and registration with the health authorities as a stillbirth if the child dies; this period may vary from

---

* Presented before the Statistics Section of the American Public Health Association at the Seventy-seventh Annual Meeting in New York, N. Y., October 25, 1949.

This is one of a series of papers originating from special studies of the EMIC Program and vital records in the Department of Health of the City of New York.

one to six days after birth. It is thus apparent that the comparison of fetal death statistics from country to country and within the United States is of little significance at the present time.

If one attempts to study the problem in one community, he is immediately faced, as well, with the problem of knowing how completely stillbirths or fetal deaths, no matter what definition is used, are reported to registrars of vital statistics by the physicians and hospitals in the community.

In an attempt to estimate total pregnancy wastage, the Board of Health of New York City on January 1, 1939, amended the Sanitary Code[2] and required the reporting of all fetal deaths regardless of length of gestation. A fetal death was defined in the 1939 amendment as a "stillbirth or a fetus delivered at an abortion (spontaneous, therapeutic or induced), that is, a fetus born dead, including a fetus recovered at operation in a case of ectopic gestation, by caesarean section, and a hydatid or hydatiform mole delivered spontaneously or by operation." Table 1 shows the marked increase in reporting of fetal deaths after this amendment of the Sanitary Code was enacted.

TABLE 1

Reporting of Fetal Deaths in New York City

Year	*Number of Fetal Deaths*	*Ratio to 1,000 Live Births*
1898	5,638	47.4
1908	7,191	49.3
1918	6,793	49.2
1928	6,121	48.5
1938	4,995	48.9
1939	6,831	66.8
1940	7,986	74.4
1941	8,974	78.5
1942	10,013	75.9
1943	9,508	70.7
1944	9,987	81.4
1945	10,367	80.5
1946	12,980	85.0
1947	14,077	82.2

With this increase, the reporting of fetal deaths in New York City was recognized as being much more complete than in most areas. No simple way of testing the completeness of this report ing, however, was found until the EMIC program* made one available.

Under the regulations of that program, a physician or hospital or both were required to file a brief summary of the medical course of the patient prior to payment by EMIC. When these EMIC summaries were tabulated, it was found that there were 2,045 pregnancies in 1943, 1944 and 1945 which terminated in a fetal death. A search was then made to see if a fetal death certificate was filed with the New York City Department of Health for each of the 2,045 fetal deaths. It was found that a certificate was filed for 1,147 or 56 per cent; no certificate was filed for 898 or 44 per cent. It was thus evident that the reporting of fetal deaths in New York City did not give a complete picture of total pregnancy wastage, since approximately 50 per cent were unreported.

Since additional data were available on the unreported fetal deaths, they were analyzed to determine the role played by various factors which might influence reporting—the place of occurrence of the fetal death, the type of physician attending the patient, and the length of gestation.

PLACE OF OCCURRENCE OF EMIC FETAL DEATHS

Section 32 of the *Sanitary Code* of New York City requires that a physician, hospital superintendent, midwife, funeral director, or parent report the fetal death; reporting by a parent is required only if the fetal death occurred unattended. It is obvious that when the fetal death occurs in a hospital, the responsibility for reporting is shared by the hospital superintendent and the physician. The chances of reporting should, therefore, be better than in an attended fetal death occurring at home

* A federally supported program through which maternity care was provided free of cost to the wives of men in the four lowest pay grades in the armed forces. Women reported early in their pregnancies in many instances.

TABLE 2

Place of Occurrence of EMIC Fetal Deaths in New York City

Place of Occurrence	Total	Number of EMIC Fetal Deaths		Per cent Not Reported
		Reported	Unreported	
1. Hospital (Total)	1,942	1,135	807	42
a. Voluntary	1,046	595	451	43
b. Municipal	515	253	262	51
c. Proprietary	358	281	77	22
d. Other *	23	6	17	74
2. Home	103	12	91	88
Totals	2,045	1,147	898	44

* Includes fetal deaths occurring in federal hospital, or patients transferred from one hospital to another.

where reporting rests with the physician alone.

Table 2 shows that when fetal deaths occur at home, they are usually unreported; when they occur in hospitals, about 42 per cent are unreported. The relatively better reporting of fetal deaths by proprietary hospitals should be interpreted in the light of a procedure whereby the Department of Hospitals, which licenses only these hospitals, requires that they furnish certain medical data, including the number of fetal deaths occurring each year, before a license is renewed. These records are then checked to determine whether the deaths have been reported to the Department of Health.

TYPE OF ATTENDING PHYSICIAN

Both the obstetric specialist and the general practitioner failed to report many fetal deaths, even though their cases were better reported than those of other specialists and ward cases. The chief point is that physicians of all kinds should report fetal deaths more carefully and completely. The incidence of such deaths should be reduced as the quality of antepartum and intrapartum care is improved. But the facts cannot be known unless figures on all terminated pregnancies are available.

LENGTH OF GESTATION

The third possible factor in completeness of reporting—and which one supposes would be of great influence—is the time of gestation at which the fetal death occurred. Did physicians and hospitals really understand the term "fetal death" to mean a fetus dying at any time during pregnancy?

Table 3 shows that reporting increases with the length of gestation. Evidently the term "fetal death" was usually interpreted by physicians in terms of the word "stillbirth," with which they were familiar and which usually means a death occurring in late pregnancy.

TABLE 3

Trimester of Pregnancy in Which the EMIC Fetal Deaths Occurred

Trimester of Pregnancy	Total	Number of Fetal Deaths		Per cent Not Reported
		Reported	Unreported	
1st Trimester	858	287	571	67
2nd Trimester	386	253	133	34
Reported as "early"	68	68	0	0
3rd Trimester	559	480	79	14
Reported as "late"	2	2	0	0
Unknown	172	57	115	67
Totals	2,045	1,147	898	44

DISCUSSION

It has been demonstrated that the reporting of fetal mortality is quite incomplete, roughly 50 per cent as judged by this study. Thus, the 14,000 reported fetal deaths in New York City in 1947 may represent at least an estimated total of 28,000 fetal deaths during this period. In order to secure an adequate picture of the volume of pregnancy wastage, physicians and hospital administrators have to be made aware of the need for reporting all fetal deaths to the vital statisticians in their communities.

It is interesting that the reported fetal death ratio of 82.8 per 1,000 live births in 1947 is as high as the infant mortality rate was in 1920. Since then the infant mortality rate has dropped to a low of 26.4 for the years 1947 and 1948. It is recognized that the decrease in infant mortality was due to many factors—improvement in community water supplies, pasteurization of milk, better medical and nursing care during pregnancy, delivery, and infancy, etc. With the decrease in certain causes of infant mortality, a shift in the cause of death has also occurred, and today other causes which are natal in origin—such as premature birth, birth injury, and congenital malformations—now play a major role, indicating the increasing importance of antepartum and intrapartum care. One would hope that reductions in fetal mortality might be achieved by directing attention to factors such as the quality of antepartum and intrapartum care, nutrition of the expectant mother, socio-economic status, education of the public as to the importance of early and adequate antepartum care; certainly guided family planning cannot be ignored. It must also be pointed out, however, that some of the fetal deaths are not preventable and that their occurrence is actually biologically desirable. Thus, by early termination of certain pregnancies, the species rids itself of genetically unsound combinations, the so-called lethal or semi-lethal combinations. Our knowledge of human reproduction is still extremely limited and further studies, including large-scale longitudinal studies of "pregnancy wastage," are badly needed.

CONCLUSIONS

1. Forty-four per cent of fetal deaths resulting from pregnancies in which medical care was paid for by the EMIC Program in 1943, 1944, and 1945 were not reported as fetal deaths to the registrar of vital records in the Department of Health in New York City, where the reporting of all fetal deaths (i.e., any products of conception) has been rigorously promoted for the past decade.

2. In this EMIC fetal death series, reporting was more complete when the death occurred in the latter months of pregnancy and when the birth occurred in proprietary hospitals which are under closer governmental supervision than other hospitals.

3. There is need for further studies in the field and for greater interest of the medical profession in securing more complete reporting.

4. Uniformity in definition of terms, "stillbirth," "fetal death," "abortion," and "miscarriage," and more complete reporting of such deaths are essential before an adequate picture of the problem of pregnancy wastage is available.

Use of Antibiotics in the Presumptive Medium for Water Analysis

SYDNEY C. RITTENBERG, PH.D., AND JOHN H. SILLIKER *

Assistant Professor and Instructor, Department of Bacteriology, University of Southern California, Los Angeles, Calif.

THE shortcomings of lactose broth as a presumptive medium in water analysis are well known. Its inadequacies fall into two general categories (1) the false positive, and (2) the false negative.

False positive results are obtained when non-coliform organisms produce acid and gas in lactose broth in 48 hours. *Clostridium welchii, Bacillus macerans,* and *Bacillus polymyxa* are often associated with false positive presumptive tests by virtue of their ability to produce acid and gas from lactose; when synergistic gas production occurs the fecal streptococci are usually found as one member of the pair.

False negative results in lactose broth occur when non-coliform organisms overgrow the coliforms and prevent gas production or prevent coliform isolation in the confirmatory medium, once gas has been produced by coliforms. It might be mentioned that the false negative result has often been overlooked in water analysis. Yet, in the false negative the error is on the dangerous side, because coliforms, although present in the original water sample, are not detected.

In an attempt to eliminate false positive and false negative presumptive tests, bacteriologists have developed a great number of presumptive media containing substances which inhibit undesired organisms. Despite increased selectivity for coliform organisms, none of the selective media have proved to be satisfactory substitutes for lactose broth, and only one, lauryl broth, has been approved by the Committee on Standard Methods as an alternate presumptive medium.

The use of antibiotic substances suggests a new approach in the search for a more desirable presumptive medium. It is well known that substances, such as penicillin and tyrothricin are inhibitory to Gram-positive organisms and that Gram-negative organisms are relatively resistant.[1] The problem presents itself as to whether an antibiotic substance could be added to lactose broth in such concentration as to prevent the growth of the Gram-positive organisms while at the same time allowing full development of coliform bacteria. Both penicillin and tyrothricin have already proved valuable as inhibitory agents in selective media.[2-6]

In the present work, penicillin, tyrothricin, and streptomycin were considered as substances which might possibly be of value in the elimination of false positive and false negative reactions when incorporated into the lactose broth presumptive medium. The sensitivity of coliforms, *C. welchii,* the aerobacilli (*B. polymyxa* and *B. macerans*), and the enterococci to each of the antibiotics was determined; media containing these antibiotics were then prepared and tested in actual water analysis.

EXPERIMENTAL

Determination of antibiotic sensitivity of significant organisms—Representative

* With the technical assistance of Martin E. Ward.

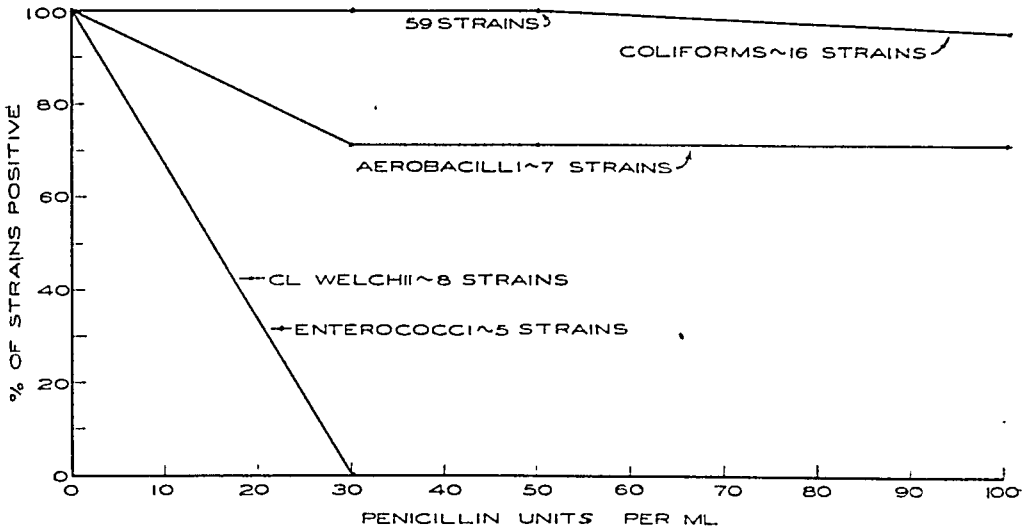

FIGURE 1. Per cent of strains of coliforms, aerobacilli, enterococci and *C. welchii* giving positive tests in lactose broth containing various quantities of penicillin.

strains of coliforms, enterococci, aerobacilli, and *C. welchii*, isolated from natural sources and also obtained from stock culture collections of laboratories throughout the country, were used for antibiotic titrations.

Lactose broth was prepared according to directions in *Standard Methods for Examination of Water and Sewage*[7] and dispensed in test tubes in 2.5 ml. amounts. After sterilization, and just before inoculation, the antibiotics were added in sufficient amount to give the desired concentration. Regardless of the concentration, tyrothricin was added in 0.05 ml. of 95 per cent ethyl alcohol, penicillin in 0.5 ml. distilled water, and streptomycin in 0.05 ml. distilled water. In each titration, lactose broth and lactose broth plus solvent were inoculated as controls. To prepare the inoculum, each organism to be tested was transferred every 24 hours on three successive days. Each tube received an inoculum of 0.05 ml. of the 3rd 24 hour lactose broth culture. All tubes were incubated at 37° C. for 48 hours, and readings were made at 24 and 48 hours. The presence of acid or acid and gas was recorded. A positive result was defined as the production of gas in any quantity at the end of 48 hours; but in the case of the enterococci, acid alone was termed a positive result. *C. welchii* cultures were incubated in an anaerobic jar, using Rosenthal's[8] chromium-sulfuric acid method.

Titration results for penicillin and tyrothricin are found in Figures 1 and 2. Since the coliform and non-coliform organisms had about the same sensitivity ranges to streptomycin, it was concluded that this drug would be of no value in the problem at hand, and therefore streptomycin results are not shown.

One of the 16 strains of coliforms tested was inhibited at 100 units of penicillin per ml.; none of these and none of 43 additional strains tested was inhibited at 50 units. All *C. welchii* and enterococcus strains were inhibited at 30 units of penicillin, but 5 of 7 aerobacillus strains were unaffected by concentrations up to 400 units per ml.

The results with tyrothricin were similar; all 45 coliform strains were positive in 100 μg. per ml.; all *C. welchii* and enterococcus strains were inhibited by 30 μg. or less, while 4 of the aerobacillus strains gave gas in the presence of 50 μg. per ml.

From these data it would appear that

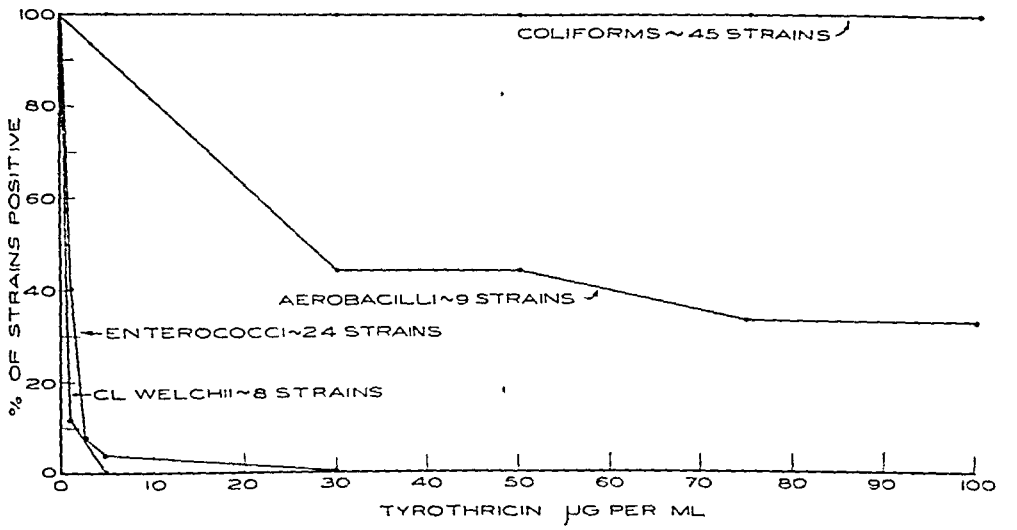

FIGURE 2. Per cent of strains of coliforms, aerobacilli, enterococci and *C. welchii* giving positive tests in lactose broth containing various quantities of tyrothricin.

the addition of between 30 and 50 units of penicillin or 30 to 100 μg. of tyrothricin per ml. of lactose broth would result in a medium that would eliminate false positives due to *C. welchii* and enterococci and part of those due to the aerobacillus group, without inhibiting gas production by coliforms.

The technique employed in the above titrations resulted in an inoculum of approximately 2 x 10^7 cells of the test organisms per tube. In water analysis one deals not with millions or even thousands of organisms in the presumptive tubes but with significantly smaller numbers. Since the effect of many bacteriostatic and bactericidal agents is a function of the number of cells exposed, it was of importance to test the effect of tyrothricin and penicillin when smaller inocula are used.

For testing the effect of antibiotics on smaller inocula the most sensitive and most resistant strains were used. *Escherichia coli* 26 and *E. coli* W (both from the Army Medical School collection) were sensitive to 100 units but not to 50 units of penicillin per ml.; *Aerobacter aerogenes* A.T.C. 8308 and *Bacillus macerans* 888 (obtained from Dr. N. R. Smith) were unaffected by 418 units per ml. *B. polymyxa* 1A and 1B (fresh isolates) were resistant to 100 μg. per ml. of tyrothricin. Cultures of each organism were prepared in the manner previously described. The cultures were then diluted in 99 ml. water blanks to $1:10^{10}$. Plate counts were made from bottles representing $1:10^6$ and $1:10^8$ dilutions of the original cultures. Tubes containing lactose broth, lactose broth plus antibiotic, and lactose broth plus solvent were inoculated with 0.05 ml. from each dilution of the original culture. Cultures were incubated and read as previously described. The size of each inoculum was calculated from the plate counts. Results are presented in Table 1. Because of the technique used there is a hundred-fold difference between positive and negative results, no data being obtained on intermediate points.

It can be seen that, in general, a larger inoculum was required in the presence of either antibiotic than in the control to obtain positive results. In each case, a smaller number of coliform organisms was needed for positive results with tyrothricin present than with either of the penicillin concentrations tested.

* Size of smallest inoculum tested giving a positive presumptive test.
† Size of largest inoculum tested giving a negative presumptive test

The very large inocula of aerobacilli required to give a positive presumptive in the presence of either antibiotic in the medium suggests that these organisms would give very little difficulty in actual water analysis. On the other hand, since both penicillin and tyrothricin apparently have some inhibitory effect on the coliform strains used, one might expect some false negative results to arise when examining water containing small numbers of coliforms using media containing the antibiotics. In order to get a better measure of the inhibitory effect a more quantitative experiment was done.

E. coli 26 was used. Suitably prepared 24 hour cultures were diluted in sterile distilled water in such a manner that the inoculum finally used approximated a single cell. Five runs were made, each with a different sized inoculum. From each different dilution, a series of lactose broth and tyrothricin lactose broth tubes were inoculated, each tube containing 2.5 ml. of lactose broth and receiving 0.05 ml. of the diluted culture.

The number of cells introduced per tube was determined by making ten replicate plate counts from the culture dilution used. Thus, in one instance there was an average of 6.2 organisms per ml. in the diluted culture, and since 0.05 ml. was used in each tube, the calculated inoculum was 0.31 organisms. It may appear incongruous to speak of an inoculum of less than one organism per tube. This merely indicates, however, that if there were even distribution of the organisms in the dilution blank and if each viable cell were to grow in the new medium, then one hundred tubes tested with this inoculum should produce 31 positive tests.

Table 2 shows that in both media the percentage of positive tests increased with the size of the inoculum. In no case was the percentage of positive tubes as high in the antibiotic medium as in lactose broth, but, even in the control medium, the recovery never reached that which would be predicted from the size of the inoculum as determined by the plate count. At concentrations between 25 and 75 μg. per ml. of tyrothricin the recovery was apparently independent of the antibiotic concentration.

In Figure 3 the percentage of positive tubes has been plotted against the inoculum. Tyrothricin results represent a summation of all concentrations tested in each dilution. Each of the experimental curves has been extended by

inspection so that it intersects a line parallel to the horizontal axis corresponding to 100 per cent positives. In addition, a theoretical curve has been drawn showing the percentage of positives which would be expected under ideal conditions, i.e., perfect distribution and growth of each cell in the new medium.

With reference to Figure 3, it can be seen that 100 per cent positive tests in lactose broth would be predicted with an inoculum of 1.8 organisms per tube as compared to an inoculum of 2.4 in the antibiotic medium. Failure to attain complete recovery of coliforms in either medium can be traced in part to the distribution error and in part to inherent physiological differences in the individual cells of the culture. Whatever the reason, it is apparent that the antibiotic medium is somewhat more inhibitory to test organism than lactose broth; in actual water analysis such an effect might result in false negative results with waters of low coliform density. Due to the effect of other organisms it is probable that in natural waters a still greater number of coliforms would be required to produce 100 per cent positives in either medium. The question arises as to whether the antibiotic would render the medium sufficiently more selective than lactose broth to compensate for the undesirable effect of coliform inhibition.

Only a single coliform strain was tested in this fashion, but, since the strain used was the most sensitive to tyrothricin in our collection, it was felt that the inhibitory effect was of sufficiently low order to warrant a test of tyrothricin lactose broth in routine water analysis. This portion of the work was exploratory in nature and no attempt was made to treat the data in a rigorous statistical manner. It is suggested that the technique described might prove valuable in testing other proposed pre-

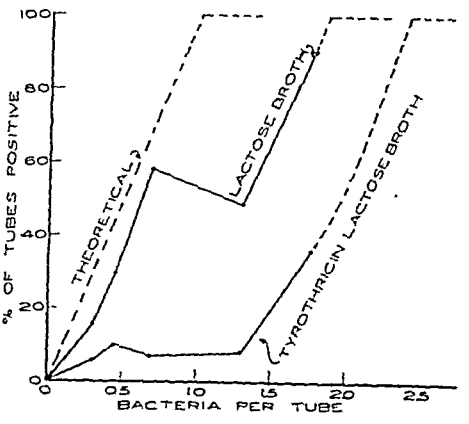

FIGURE 3. Per cent of positive presumptive tests given by very small inocula of *E. coli 26* in standard lactose broth and tyrothricin lactose broth.

sumptive media, as it gives a ready means of evaluating the maximum efficiency of any such medium.

The use of antibiotic media in routine water analysis—Samples taken from the Los Angeles Water District were tested. On the basis of the work in the preceding sections, lactose broth plus 25 μg. of tyrothricin per ml. and lactose broth plus 30 units of penicillin per ml. were used. In addition, standard lactose broth and 2 per cent brilliant green bile broth were used as controls. For all water samples, five tubes of each of the four media were inoculated; 10 ml. of the water being added to 10 ml. of double strength medium. All tubes were incubated at 37° C. for 48 hours and were examined at frequent intervals for gas production. As soon as gas in any quantity was detected a subculture was made by streaking on an eosin methylene blue agar plate. The plates were examined after 24 hours, and where typical *E. coli* or *A. aerogenes* colonies were found, a positive completed test was assumed. Where only atypical colonies were observed the standard completed test was run. A total of 48 raw water and 49 treated water samples were examined. The data obtained are summarized in Table 3.

The tyrothricin broth is obviously inferior to the other broths as to recovery of, and selectivity for, coliforms. Of the other three media, the standard lactose broth yields the greatest number of positive completed tests but has the lowest per cent of presumptive tests completed. This relationship arises from the greater number of coliform recoveries in lactose broth from raw water samples, since with treated waters brilliant green bile medium gave more positive completions. The results with brilliant green bile broth and penicillin lactose broth were about the same in regard to total positive completions, the former yielding slightly higher numbers from treated waters and the latter showing a few more positives from the raw waters. The brilliant green

bile broth was more selective, giving a higher per cent of presumptive tests completed with both types of water.

A slightly different picture is obtained when the results are considered in terms of positive waters detected. If a "positive water" is defined as one which yields at least one positive completion, regardless of the medium in which it occurred, then standard lactose broth gave 45 positive waters, brilliant green bile 35, penicillin lactose broth 36, and tyrothricin lactose broth 24. Fifty-nine positive water samples were detected from the four sets of media. No one medium found all the positives in either group. Lactose broth gave the highest results (89.7 per cent) followed by penicillin lactose broth (74.3 per cent) for the raw waters; lactose broth and brilliant green bile broth gave the same results for the treated waters (50 per cent).

DISCUSSION

It would seem from the data that the particular antibiotic containing media used offer no advantage over the standard lactose broth as a presumptive medium. Retaining the principle of an antibiotic as a selective agent, the most obvious change that could be made in the formulas of the media is the antibiotic concentration. Surprisingly enough it is hard to predict in what direction the change should be made. Increasing the concentration could result in the inhibition of more sensitive coliform strains with consequent lower recoveries; decreasing the concentration could result in more presumptive positives but might also decrease the total coliform recoveries because of the overgrowth of complicating organisms not inhibited.

From the titration data in the first section of the paper one might have expected a greater selectivity of the media and a higher coliform recovery. The data from actual water analysis emphasizes the fact that the activities of mixed flora cannot be predicted from pure culture studies. Along with the direct effects of the non-coliforms on the coliforms in water, there is the added effect of the microflora on the antibiotics themselves. The existence of organisms in nature that inactivate penicillin is well known, and, although as yet unreported, similar ones destroying tyrothricin are far from unlikely. These factors further complicate the logical selection of proper antibiotic concentrations and make it evident that future studies in this direction would be strictly empirical.

Other changes beside antibiotic concentration might result in a more valuable presumptive medium, such as changes in the sugar or peptone concentration, the use of a more selective nitrogen source than peptone, the incorporation of materials like cacotheline and hydroquinone to inhibit Gram-negative non-coliforms, and the use of a buffer in the formula. It is obvious, of course, that these changes could be studied with equal benefit in relation to any of the numerous media already in use or proposed for the presumptive test.

The data can also be discussed from a broader viewpoint. It has been seen that no one medium detects all the positive water samples whenever a relatively large number of waters are being tested. In fact, the larger the number of media the more positive waters are detected. This, of course, is partly due to the increased amount of water which must of necessity be tested as the number of media are increased, but other factors are also involved. When a single water will give 4 confirmed positives out of 5–10 ml. samples in a single medium and fails to show as many as one in the 15 tubes of the other three media each containing 10 ml. of the same water then random distribution or increased amounts of water tested cannot explain the results. This situation, and others quite similar, were observed in individual waters in the series, and there was at

least one instance in which each of the four media used was significantly superior to the other three.

One might state the obvious truism that no two samples of water are exactly alike. It may be that each water, or closely related type of water, demands a unique medium for perfect analytical results based on the coliform density. Should this hypothesis approach the existing situation, then the search for the "perfect presumptive medium" becomes the search for the philosopher's stone. Might it be suggested that any marked improvement in the methods for the sanitary examination of water demands an entirely new approach?

SUMMARY

The addition of antibiotic substances to lactose broth has been considered as a possible means of increasing the efficacy of the presumptive medium in water analysis. Sensitivity of coliforms, aerobacilli, enterococci, and *C. welchii* to penicillin, tyrothricin, and streptomycin was determined. With pure cultures appropriate concentrations of penicillin or

ı

l

used as controls. Penicillin lactose broth was less sensitive (fewer positive completed tests) but more selective (a higher per cent of positive presumptive tests completed) than standard lactose broth. With reference to brilliant green bile broth, the penicillin medium was equally sensitive but less selective. Tyrothricin lactose broth was inferior to the other three media in both respects. No medium detected all the positive water samples.

It is concluded that modifications in the present formulation of the antibiotic media will have to be made if they are to be of practical value in water analysis.

ACKNOWLEDGMENTS—The authors are grateful to Mr. Harry G. Neumann of the Los Angeles Department of Water and Power for providing the water samples. They also wish to express their appreciation to Drs. Max Levine, L. S. McClung, H. Katznelson, N. Kramer, E. S. Wynne, and N. R. Smith who supplied some of the cultures tested.

Public Relations in Public Health*

VLADO A. GETTING, M.D., DR.P.H.

Commissioner, Massachusetts Department of Public Health, State House, Boston, Mass.

PUBLIC health is big business. Federal, state, and local governments expend through health departments almost 400 million dollars[1] annually for this important commodity. Public health is one of government's most important businesses, in that it not only promotes and maintains within a nation a high standard of living, but assures the nation a people who are vigorous, active, and physically prepared to meet national emergencies. The health enjoyed by our civilian population determines the physical fitness of our military forces. Without good health no nation may expect to survive either in peace or war.

That civilizations have fallen in the past because of poor health has been often and well demonstrated; for example, the devastating effects of malaria upon the golden era of Greece; the pernicious destruction wrought by malaria, typhoid fever, and smallpox which hastened the fall of the Roman Empire; or, finally, the hastened collapse of the Italian and African fronts through the crippling effects of disease in the last World War. That the eradication and suppression of such scourges is not alone the result of public health practice is common knowledge; but it is a fact that, through the application and extension of public health measures, nations have experienced tremendous improvement in the health of their civilian and military populations.

While past experiences have shown that efforts of health departments alone cannot prevent disabilities and illness, it is nevertheless true that adequately staffed health departments, working in coöperation with the medical profession, hospitals, and other community resources, can do much to maintain good health and keep to a minimum unnecessary illness, disability, and deaths.

THE ROLE OF PUBLIC RELATIONS

The attainment of the objectives of any program can be hastened by the employment of a continuing, good public relations program. Certainly, government's investment in the work of a health department deserves a critical analysis of the techniques which that health department employs in enabling people to attain and maintain optimal health through the prevention of unnecessary disability and sickness, the prolongation of life and the development of a sense of physical, mental, and social well-being.

In the attainment of these objectives, public relations can play a most important part, provided it is based on a well organized plan implemented with careful thoughtfulness by the entire staff of the department. In this respect, public relations may be considered as a science through which an organization may discharge its obligations in a manner which secures that public recognition and approval which is necessary to success.

A program of public relations involves many facets. It is more than health

* Presented before the Health Officers Section of the American Public Health Association at the Seventy-seventh Annual Meeting in New York, N. Y., October 25, 1949.

education. It covers, in fact, all of the relations which the department's staff has with the public from a telephone message or a letter, to the nurse's visit, the sanitary inspection, the investigation of a complaint, the examination of the school child, or the immunization of a baby—all of which are daily opportunities for health workers to win public understanding and support of the department's health program.

Recent years have brought vast changes in the social and economic structure of the nation; progress in medical science has caused attendant changes in health programs. New public health laws have brought new services and responsibilities to state and local health departments.[2] This rapid expansion, however, has not at all times occurred as a part of well considered or carefully integrated community health programs, nor has public understanding in all instances kept pace with this expansion. The health department must accept its portion of the responsibility for this failure. It is not only the health department's function, but a prerequisite to the success of its programs, that it evaluate, assimilate, and guide public opinion. By so doing any program which it initiates will not only reach, but become a part of the community. Each health department employee must realize that good public relations are involved in all aspects of his work.

PUBLIC RELATIONS METHODS

The use of public relations as a descriptive term becomes at times, vague and misleading. Its objectives may be divided into several categories: (1) the internal relations within a department; (2) the dissemination of information or health education; (3) community organization; (4) professional relations; and (5) governmental relations with other agencies of local, state, and federal government.

The tools of the science of public relations are many, and in general the health officer is oftentimes startled by the plethora of media available: radio, newspapers, movie films, lantern slides, television, letters, telephone calls, personal visits, exhibits, talks, personal appearances, and last but certainly not least, pamphlets and annual reports. These and many other tools are available to each of the staff for the formulation of public opinion leading to the creation of a demand for health services. An appreciation of the need for health services on the part of the public must be followed by their continued use of these services. Only in this way can the health department succeed in establishing the utilization of health services and, in the final analysis, receive the necessary support for increased health appropriations and improvement in salaries, equipment, and physical facilities so urgently required by many health departments.

INTERNAL RELATIONS

Public relations, like charity, begin in the home. A health department must, therefore, establish a well formulated internal relations program for the improvement and strengthening of personnel relationships. To maintain the acceptance and understanding of all members of the "inner circle" or departmental staff is a prerequisite to the department's successful liaison with outside groups. Serious consideration must be given to the employee's concept of the fairness, understanding, courtesy and kindness extended to him by the department, as well as to his reaction to the physical plant in which he works. Staff integration is all important. The busy atmosphere attendant upon good staff morale creates within the department an environment into which the outsider may enter with pleasure and confidence.

An awareness on the part of each employee of his department's objectives and services must be developed. While

the health officer is the key in all health department programs, the public relations program is not his field exclusively. The health officer may set the pace and policies and determine the plans for a public relations program, but to make it effective his entire staff from the chairman of the board to the humblest clerk must have a thorough knowledge and appreciation of the work, objectives, plans, policies and hopes of the department.

Since every contact of a health department employee is an opportunity for the development of good community relations, it is urgent that a proper in-service training program be developed for the instruction of personnel. Such a program should include a series of lectures, or talks, or informal seminars given by persons skilled in public relations, health education, and the humanities. A manual of procedures[3] should be developed which should include simple duties such as proper telephone deportment, correspondence standards, the management of visitors, home visits, and other everyday activities of each of the various professional and clerical staff members. The truly great opportunity to improve public relations lies in this effective utilization of the numerous and varied contacts of the staff. This can be far more effective and infinitely less expensive than any large-scale promotional or publicity campaign.

Through regular staff meetings the objectives, plans, policies and procedures of the health department should be carefully analyzed and evaluated. Such conferences offer to staff members an excellent opportunity to become acquainted with the programs and activities of fellow workers and thus bring about a deeper understanding and appreciation of the work carried on in other fields of activity—a reciprocal internal support which is the keystone of not only good public relations but also of a good public health program.

HEALTH INFORMATION

The dissemination of information, through departmental publications, constitutes an important segment of a health department's total public relations program. The use and abuse of a few of these publications may serve to illustrate the methods whereby success or failure may be realized.

All health officers receive the annual reports and pamphlets of other health departments. Few publications, unfortunately, are of interest. As these reports do not appeal to the health officer, it is reasonable to assume that they will not be read by the layman. In the final analysis, the function of an annual report is not to record but to inform. Bulky volumes of statistical analyses, prefaced by long narratives and printed in small type upon a poor grade of paper, quickly find a place in the "circular file." The annual report should be a report to the employer—the public. Printed on good quality paper, in color, well illustrated and in large print, it should present only the highlights, the objectives, and the recommendations for future action.[4] Above all, it should be interesting. It has been said that there are no dull subjects, but only dull writers.

Pamphlets too often are a waste of money and effort. Printed on newsprint, with very small type and without color or illustrations, their very appearance too often discourages the reader from investigating the content. A pamphlet should be short, its message simple, couched in basic English, and presented in a form which will be inviting. This again requires good illustrating, color, large print, brevity, and paper of good quality.

Newspaper releases, an important public relations medium, may be either an excellent method of creating or destroying good public opinion. If poor in character, a news release may receive a bad press, no press at all, or so antago-

nize the press that it creates a poor public opinion of the work and services offered by the health department. Above all, a newspaper release must have news value; it must be truthful and so written that technical language and statistical reports are transformed into a message which skillfully informs and at the same time maintains the interest of the general public. Although newspaper publicity may be considered vital to a health department in order that it keep its purposes and objectives in the public consciousness, its use should not be permitted to dominate the total public relations program. "Emphasis," it is said, "is too frequently placed on the tools of publicity rather than the skill with which they are utilized."

COMMUNITY ORGANIZATION

It is not enough for a department to have vague plans for the improvement of the health of the community; it is not enough, for example, to plan to improve immunization against diphtheria. Plans for new or expanded services must be definitive in time, in place, and in quantity of work to be accomplished; they must be definitive in the quality of services rendered. These objectives can be crystallized only after a careful study of community needs and of the acceptability of programs by the people served; they must be based upon an objective analysis made in coöperation with other voluntary and official agencies.

The public demand and utilization of a health department's services determine the success of health programs. To be efficient, these services must be coördinated with those of other agencies. This means that the community relations program of a health department must reach the public, the healing arts professions, and other official and voluntary health and social agencies. The health officer in working with such groups must clearly define the department's objectives in order to foster the coöperative development of public support. People must not only know what is necessary for the maintenance of their health, but they must also be made aware of the services available to them through the health department and other community health agencies. They must know the what, where, how, and when of obtaining the services, and, finally, must be motivated to demand them.

"Submerged leadership" of the health officer within community organizations, such as health councils or health divisions of councils of social agencies, will successfully coördinate community health programs. That is, he provides the necessary guidance, advice, and support to interested citizens and agency workers in the development of health programs, and he allows the credit for implementing such measures to be enjoyed by them directly. "Credit," it has been said, "is like a bacterial colony, the more you divide it the more there is." After all, the health officer has attained his objective if civic leaders speak of "our" health program. A community health council can be a health department's watch dog. It may be its staunchest friend; and support the health officer's efforts in a way which will never subject the health officer to criticism that he may be seeking either more authority or a better salary.

Important objectives as, for example, increases in departmental budgets or the passage of legislation are far more readily realized when supported by an interested citizenry. However, the mere passage of a public health law does not bring about the success of any program. As Abraham Lincoln pointed out, it is "the acceptance on the part of the people or the public opinion behind a law which makes its enforcement and execution possible or impossible."

PROFESSIONAL RELATIONSHIPS

The practising physician is the most

important dispenser of preventive medical services, and it is urgent that cordial relationships be maintained between the medical profession and the health department.[6] Unfortunately, in some areas this condition does not exist. The health department may be entirely dominated by the medical society or the society may resent the intrusion of public health programs into their spheres of activity. If a health officer desires to have his program understood and endorsed by the professions, he must present it in a forthright manner. However, a cordial liaison with a professional group does not imply that the program need be directed by them but rather that their endorsement, assistance, and support is necessary to success. To improve friendly relations, members of the staff of the health department should be urged to maintain active membership in their professional societies. This includes attendance at professional meetings, participation in their programs and work on the various organizational and scientific committees. The health officer or public health nurse who avoids active membership in his or her professional society is failing in responsibility to the department as well as the profession and does not assist the department in obtaining the necessary support and understanding of its program.

Technical advisory committees should be organized and should meet periodically. Their purpose is to give advice and, conversely, to be informed of the objectives, plans, and policies of the department. The members of these committees through acquaintance and understanding of various health programs may actively support their objectives and interpret the work of the department to their daily contacts.

GOVERNMENTAL RELATIONS

The health department is only one member in the family of local government agencies. In all families antagonism may arise among members, and there are communities in which definite antagonism exists between the school department and health department. Similarly, there are instances in which the public health nurse, the school nurse, and the Visiting Nurse Association nurse do not integrate their activities, as a matter of fact will not pass one another on the same side of the street. These conditions are examples of poor public relations. In each community activity there should be organized regular inter-agency conferences. School health is the joint responsibility of the health and school departments. Public health nursing is the joint responsibility of all agencies employing public health nurses. After all, it is the community health program which is important and not the isolated Visiting Nurse Association, school committee, or health department program. Too often a health worker loses sight of the ultimate objectives because of jurisdictional disputes, and the efforts of all involved are ineffectual. Cordial relations must be maintained not only among the agencies of local government but with health, welfare, and social agencies at all levels of government.[7] Nowhere can we find a better record of excellent relationship than that which exists between the Public Health Service and state health departments. Similarly, there should be established between state and local departments an equally good inter-agency relationship through joint conferences of state and local health authorities. In communities, inter-agency coördination can be best achieved through community organizations which have accepted crystallized objectives for a health program.

CONCLUSION

Public health is big business. And, while never before have people been as aware of health as they now are, we have still fallen short of creating a proper demand for the attainment and

maintenance of optimal health. Therefore, the entire health department staff must engage in a continuous program of good, well planned public relations through an inservice personnel relations program for its employees and by the crystallization of objectives known to all and implemented by specific services and responsibilities. Many media of public relations are available, but they must be attractively presented to be effective. The health department, working with all of the professions of the healing arts as well as with community leaders and various groups, must develop public opinion to demand the attainment and maintenance of optimal health.

Finally, the public must have confidence in the ability and work of the health department. It must be made to feel the need of the department and the services which it offers.

John J. Sippy Memorial Fund

Walter H. Brown, M.D., of Palo Alto, Calif., Chairman of the John J. Sippy Memorial Committee, Western Branch, American Public Health Association, recently announced the vote of the Western Branch at its recent Annual Meeting in Los Angeles to establish a John J. Sippy Memorial Fund. This was believed to be the most suitable and practical form of memorial for the late Dr. Sippy, who was Health Officer of San Joaquin County Health District for many years, and a Past President of the American Public Health Association. It is the plan of the Western Branch that the fund would be used to provide a lecture to be given at the Annual Meeting of the Western Branch, preferably by a member of the Western Branch. The lecturer and the subject will be chosen by a committee appointed annually by the President of the Western Branch on the basis of some outstanding contribution in the field of public health.

According to Dr. Brown's announcement, the response to the proposal has been both spontaneous and gratifying. The Executive Committee of the Western Branch has already made an initial contribution from the limited funds of the Branch, and the past and present members of the staff of the San Joaquin Local Health District have made a substantial contribution of the funds remaining from those collected by them for a memorial plaque at the office of the District.

Dr. Brown has announced that members of the Western Branch and others who wish to contribute to this fund may do so by sending their gifts in care of Dr. Brown at 628 Guinda Street, Palo Alto, Calif.

Poliomyelitis in San Francisco, 1948

J. C. GEIGER, M.D., F.A.P.H.A.
Director of Public Health, San Francisco, Calif.

IN consonance with the nation and the state, San Francisco last year experienced, from the standpoint of numbers, the largest epidemic of poliomyelitis in its history. Even though our statisticians can show that, calculated upon population, the morbidity rate for 1948 was less than that experienced in 1930, nevertheless 288 cases of local origin were reported during the calendar year. This is a record and parallels the nation's reported 27,658 cases, and the record total for the State of California of 5,804 cases.

This epidemic spread across the nation from east to west and particularly throughout the South. It entered California through the southern area, and gradually crept northward until the entire state was involved. Even though it developed into the largest outbreak recorded, there was no evidence of panic among the population. Never have the patients received such excellent educational advantages, splendid medical care, and adequate hospital facilities. Though facilities were taxed, adequate nursing care was provided, and physicians always seemed to be available. The poliomyelitis patients treated in San Francisco have never received better nor more complete medical care in the history of modern medicine.

In the periods of increased incidence of poliomyelitis, occurring in San Francisco in 1934, 1943, and 1945, the epidemic period began and ended within the calendar year. In 1930 and in 1948 the incidence exhibited a downward trend from the peak in October of each year, but the epidemic was not terminated until early in the following year. For purposes of this review of the recent epidemic, reported cases and deaths for a 12 month period from March 1, 1948, to March 1, 1949, have been selected to cover the full period of the epidemic, and, where necessary, information for the same months is offered for 1930.

Although the 314 cases reported in the 12 month period (1948–1949) exceeded by 29 per cent those reported in a similar period (1930–1931), the morbidity rate was lower; 36 per 100,000 for the recent period, 38 per 100,000 in 1930–1931. In California for the same period, 6,042 cases were reported with a case rate of 60 per 100,000.

In the local series of cases, 27 deaths occurred—8.6 per cent fatality for the group. Since all deaths occurring in San Francisco are chargeable to the records, the death rate is computed on the total of both local and non-local deaths. This total of 53 deaths produces a mortality rate of 6.0 per 100,000 population.

Distribution by sex shows 173 cases, or 55 per cent male, 141 or 45 per cent female. Of the 27 local deaths—13 or 48 per cent male, 14 or 52 per cent female. The case fatality rate for males was 7½ per cent—for females, 10 per cent.

Seventy-two per cent of the cases and 40 per cent of the deaths occurred in groups under 15 years of age. The epidemic apparently was felt most keenly in the primary school group, 5–9 years, with a total of 108 cases or 34 per cent of the total. It may be that this group

was under closer supervision at home and at school, that symptoms were recognized and treatment begun earlier, or that these children responded more readily to treatment. Whatever the underlying cause, the fact remains that only 3 per cent of these 108 cases resulted fatally—the lowest fatality in any age group. Three age classifications show a very high rate of mortality. In the high school group (15–19) were found but 5 per cent of the cases with an 18 per cent fatality. In the 30–34 years group were found 4 per cent of the cases and a 21 per cent fatality, and in the group of adults 35 years and over, there were 3 per cent of the cases and a fatality of 33 per cent. Actual ages for this last group were 35(2), 36(3), 38, 39(2) and 40, deaths occurring at ages 38, 39 and 40. There were no deaths in the under 1 year group, and only 4 per cent of the cases were found in that period.

In spite of recent scientific suggestions, involving sewage, milk, water, and insect vectors, the person must still be considered of prime importance in the transmission of this disease. From the very beginning rigid quarantine of close intimate contacts was enforced. During this outbreak, 484 individuals were quarantined, as members of 251 families in which a case of poliomyelitis had occurred. In addition, 114 non-family contacts were placed under quarantine. Thirty-four cases developed from known contacts. In twenty-three instances two members of the same household contracted the disease and in each of four of these homes, one of the patients died.

To Children's Hospital and the Isolation Division of the San Francisco Hospital fell the responsibility of caring for hospitalized cases, with 49 per cent of the cases at Children's and 40 per cent at Isolation. Seven per cent of the cases were either coroner's cases, dying before hospital care was available or were cases receiving home treatment. Twelve patients were cared for in other hospitals; Letterman taking 5, Veteran's Hospital 4, Alcatraz 1, and 2 going across the Bay—one to Highland and one to Oak Knoll. The case sent to Oak Knoll died there but the death is not included in any mention of fatality since it was not chargeable to San Francisco. Thirty per cent of the deaths occurred at Children's Hospital, and 39 per cent at Isolation.

The seasonal trend for the epidemic is established in the report of cases by date of onset. From July 3 to February 5 there was uninterrupted weekly reporting. The rise in incidence was gradual, reaching a peak in the week ending October 16, with a report of 23 cases. No significant change in this high level of incidence was noted until a month or six weeks later when a definite leveling off developed. As early as the middle of December, with reported incidence slowly but steadily declining, it was almost certain that the epidemic period would extend into the early part of 1949. Events proved the assumption true, for by the end of February, 27 new cases had been reported; 11 of them with onset dates in December of 1948.

The accompanying chart has been prepared on the 12 months' basis (1948–1949). It indicates the date of reporting by physicians, and the onset date of the disease as determined by the Health Department epidemiologists. The usual lag between the reporting date and the onset date is evident but not too exaggerated.

It is not possible to establish a rate of incidence in any one locality of the city because no population estimates for Census Areas are available. However, reports of cases through the epidemic period came from almost every district in the city, with not too great a concentration in any one area. The high-

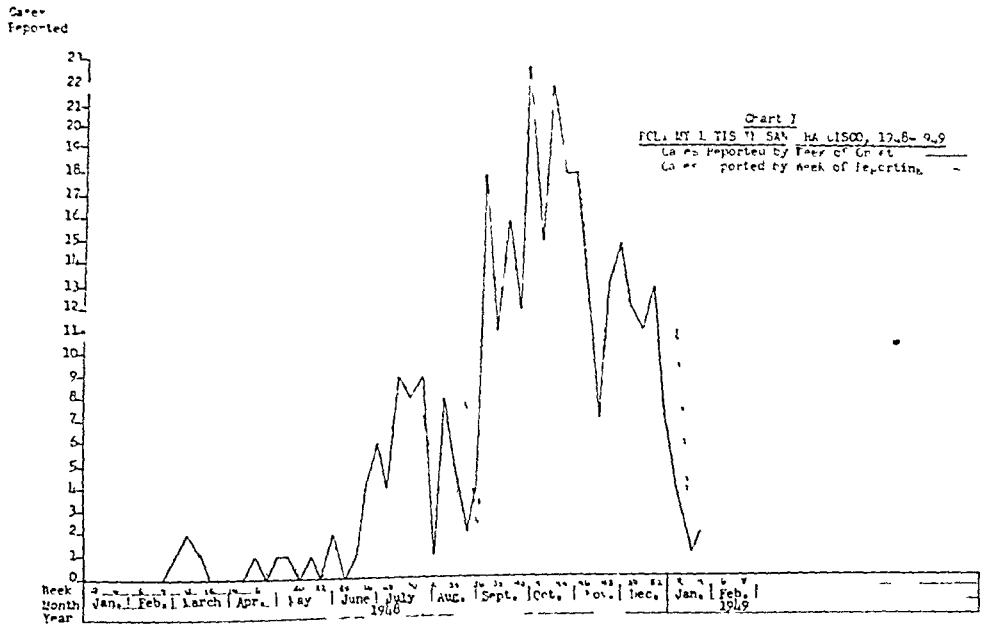

Chart I

est percentage of total cases reported was found in District L—22 per cent. This lies in the southeastern part of the city and includes several re-development projects and a varied racial distribution. Two districts, M and N, with 15 and 18 per cent of the cases respectively, constitute a large residential area; much of it lies in what is known as the Mission District, recognized locally as having an equable climate. District P, which runs from Lake Merced to Golden Gate Park and is one of the newer residential areas of the city, reported 9 per cent of the cases.

Although racial groups are concentrated very largely in definite localities, it is rather significant that only 12 cases were found in the non-white portion of the population; 4 among the Chinese, 6 in the Negro population, 1 Japanese, and 1 Filipino. This Filipino case resulted fatally and 1 death also occurred in the Chinese group of cases.

Attending physicians, making their original reports of poliomyelitis cases, classified the case as being of a bulbar type, a paralytic type or a non-paralytic type. Of the 314 local cases studied 42 or 13 per cent were of the bulbar type, 161 or 51 per cent fell into the paralytic group, and the remaining 111 or 35 per cent were non-paralytic. The degree of paralysis was not easily recorded but of the 161 cases classified as paralytic, 108 or about 67 per cent of them showed a definite paralysis while the remaining 33 per cent showed only muscle weakness or spasm. A follow-up of all cases, three to six months after onset, will doubtless reduce greatly the paralytic proportion.

As early as May non-local cases were being reported in excess of a normal expectancy, with evidence of the earlier beginning of the epidemic in other parts of the state. A total of 251 non-local cases were brought into San Francisco for treatment during the 1948–1949 period. Although a few of these cases were entered for care at Isolation Hospital and at Letterman, 82 per cent of them were taken to Children's for hospitalization. Nearly one-half of the deaths from poliomyelitis chargeable to San Francisco, occurred in this non-local group of cases.

About 4 per cent of the total cases in

the state were brought into San Francisco for treatment from outside counties. Adjacent counties, where hospital facilities were inadequate appear to be the greatest contributors to this group. For example, Marin County sent 86 per cent of its cases here, San Mateo County —21 per cent of its cases, Contra Costa County—23 per cent, and Santa Cruz County—56 per cent. Other smaller communities at greater distances from San Francisco and in which no hospitalization was obtainable, transferred many if not all of their patients to local hospital services. Among such communities was Stanislaus County which delivered 61 per cent of its cases to local care here. So many factors enter into the statistical analysis of these non-local cases that they cannot be considered representative of this locality, and it seems advisable to leave a detailed study to the community of origin or to the State Department of Health, for a complete analysis.

Case rates were computed for several counties for comparative purposes. As has been mentioned before, the morbidity rate for the entire state was 60 per 100,000—for San Francisco, 35.9. The adjacent counties of Alameda and San Mateo show rates of 27.5 and 53.9, respectively. Certain areas in the southern part of the state, where the epidemic was definitely more severe, show a high rate of incidence; for example, Kern—133.4, Los Angeles—83.4, and San Diego—62.0.

Even though the answer to poliomyelitis is not yet clear, we feel progress is being made. During this outbreak every precaution has been taken to prevent spread of the disease and to provide immediate diagnosis, early hospitalization and treatment, and to initiate a thorough and continued program aimed at rehabilitation. At no point in the program has the economic factor been permitted to interfere with the total care of the patient.

The Relation of Housing to the Incidence of Meningococcic Disease in an Outbreak in Oak Ridge, Tenn.*

BERNARD M. BLUM, M.D., M.P.H., F.A.P.H.A., AND WILLIAM F. ELKIN, M.S., M.S.P.H.†

Director, The Fife-Hamill Memorial Health Center, and Professor of Public Health, Jefferson Medical College, Philadelphia; and Statistician, Health Physics Division, Oak Ridge National Laboratory, Oak Ridge, Tenn.

THE epidemiology of meningococcic disease is by no means completely understood. The following factors have been stated to predispose to infection: overcrowding, poor ventilation, fatigue, chilling, and lack of latent immunization. In military forces, various prophylactic inoculations and "lack of hardening" among new recruits are also said to contribute to the disease. In many places, the Negro rate has been appreciably higher than the white rate, and an excess of cases among males has been observed. In Oak Ridge, an unusual opportunity was presented to study housing in relation to this disease because the community consisted exclusively of a small number of dwelling types as a result of mass construction. The analysis which follows is concerned with an outbreak during the war period.

THE COMMUNITY

This federal reservation, known during the war period as "Clinton Engineer Works" and now designated "Oak Ridge Area" by the U. S. Atomic Energy Commission occupies a 92 square mile area in portions of Anderson and Roane Counties in Eastern Tennessee. From July, 1943, when workers began to take up residence in this formerly rural area, to January 1, 1944, the population had grown to 19,128. It continued to grow rapidly until it reached a peak of 74,930 on June 1, 1945. Thereafter the population declined, falling to 42,465 on December 31, 1946. These statistics include the military population which reached a peak of approximately 2,000 in the summer of 1945. The residential areas comprised two main parts, the larger in Anderson County, and the other about twelve miles removed in Roane County.

Houses, apartments, and dormitories which attained minimum standards of satisfactory housing were built to house approximately 46,000 persons. However, the rapid increase of workers required for construction and operation of the atomic plants necessitated in addition the construction of temporary dwellings for about 29,000 persons. Included among the latter group was the entire Negro population. These dwellings consisted of hutments, trailers, and barracks.‡

The hutments consisted of 16 ft.

---

† Formerly, Health Officer and Statistician respectively, Oak Ridge Department of Health, Oak Ridge, Tenn.

‡ All substandard housing has since been removed by the Atomic Energy Commission

square single room buildings in which were placed cots for four or five men or women. Shutters on the sides were used in place of windows. Lavatory and toilet facilities were provided in central bathhouses for groups of hutments, sometimes as many as 25 in a group. The trailers were set up primarily for families although some were occupied by persons of one sex. In general, trailer residents also were dependent on central bathhouses for toilet and lavatory facilities. Barracks, with sleeping cots laid side by side were erected for most of the enlisted men and for some civilians. These barracks in a sense were large-sized hutments. At the peak of operations, there were about 5,000 trailers and 16,000 hutment and barrack spaces.

The dwellings described above have been designated as "slum" in this report. This term is used in the sense of the definition set forth by the American Public Health Association Committee on the Hygiene of Housing, as an area in which 75 per cent or more of the dwellings show two or more basic deficiencies each. Such basic deficiencies were: (a) toilet outside structure and shared with other dwelling units, (b) bath outside structure and shared with other dwelling units, (c) water supply outside dwelling unit, and (d) room crowding: over 1.5 persons per room.[1-3]

The dwellings classified as "standard" in this report consisted of three general types: "semi-permanent" houses and apartments, "demountable" or "prefabricated" houses and apartments, and dormitories. The semi-permanent types were structures built on cement foundations with brick chimneys and central heating, but with walls constructed of cemesto boards. The prefabricated types were of more temporary construction, requiring less on-the-spot labor, but they satisfied the space and sanitary requirements of the A.P.H.A. standards. The dormitories were two-story wood and brick buildings made up almost entirely of single or double rooms. Each of them housed approximately 150 men or women, except during periods of temporary shortage when doubling up became necessary.

Rigid control of the flow of migrants into Oak Ridge brought as a by-product fairly exact statistics of the population in each housing area. Statistics by color were available as a by-product of racial segregation. Much personal information was available on records of employees and residents, but scattered in several offices. Unfortunately, statistics on such demographic characteristics as sex, age distribution, length of residence in Oak Ridge, and permanent residence were not compiled from these personal records. After it replaced the Army, the U. S. Atomic Energy Commission made estimates of a few population characteristics by sampling these records.[4] Among these characteristics were the age-sex distribution in January, 1948, and the median length of residence in several dwelling types from 1944 through 1947. For this study, the sample age distribution was adjusted with age statistics of school children available from earlier years. As will be indicated later, the unavailability of certain important demographic statistics was one factor leading to limited success in the analysis.

ANALYSIS OF THE EPIDEMIC

Twenty-six cases occurred in 1944 giving the high rate of 55 per 100,000 population; 27 cases occurred in 1945 with a rate of 40.* Five additional cases occurred in 1946, making a total of 58, all of whom were civilians.

The mean annual rates for 1944–1946 by dwelling type are compared in

* All case rates in this paper are "per 100,000 population." This phrase is not repeated in the text for brevity. All rates and their standard deviations, both for Oak Ridge as a whole and the several dwelling areas, were computed in terms of person-years of experience. The person-years statistics were computed from semi-monthly population statistics.

TABLE 1

Meningococcic Disease: Dwelling Types and Areas by Populations, Cases, Rates and Standard Deviations
Oak Ridge, 1944–1946

Dwelling Type and Area	*Mean Annual Population*	*Number of Cases 1944–46*	*Mean Annual Rate For 100,000 Population*	*Standard Deviation of Rate (σ_p)*
White standard				
Houses and apartments	25,292	10	13	4
Dormitories	8,092	4	16	8
Subtotal—white standard	33,384	14	14	4
White slum				
Roane County	5,865	9	51	17
Anderson County	9,808	21	71	16
Subtotal—white slum	15,673	30	64	12
Colored [a]				
Roane County	1,081	10	308	97
Anderson County	1,409	3	71	41
Subtotal—colored	2,489	13	174	48
All White, standard and slum	50,429 [b]	45 [c]	30	4
All slum, white and colored	18,163	43	79	12
Total	52,918 [b]	58 [c]	37	5

[a] All colored persons lived in slum dwellings.
[b] Includes full military population.
[c] Includes one case with unknown dwelling.

Table 1. The rate for persons living in standard dwellings, 14, differs significantly from the slum rate, 79, the probability of such a difference arising by chance being less than 0.001. Likewise, the difference between the white standard rate, 14, and the white slum rate, 64, has less than 0.001 probability of chance occurrence. The white slum rate not only differs significantly from the white standard, but also from the colored slum rate, 174, the probability of chance occurrence of the difference 174–64 being 0.002. Considering Roane County alone, the colored rate, 308, is significantly higher than the white rate, 51, the probability of chance occurrence of the difference being less than 0.001. However, the Anderson County Negro rate cannot be similarly compared due to smallness of numbers.

In other places, it has been observed that the Negro rate is appreciably greater than the white rate.[5–7] But only a few authors consider the influence of poor housing or other factors which might affect these attack rates. For example, Dauer found in his analysis of meningococcic meningitis in the District of Columbia during the years 1935–1936 that the rate for whites living in substandard housing was about as high as the rate among Negroes living under similar conditions.[8] However, at Oak Ridge, where housing types were more distinctly defined, the Negro attack rate was significantly higher than the rate for whites living in practically identical housing. Also, at the time of his study, Dauer did not have the benefit of the quantitative appraisal method for measuring the quality of housing subsequently developed by the A.P.H.A. Committee on the Hygiene of Housing.[2] It is probable that his use of groups of census tracts to delimit fairly large areas of white and Negro substandard housing resulted in a certain amount of variation in dwelling types within these areas.

These statistics by dwelling type and area indicate the influence of environmental conditions in Oak Ridge upon the rate of meningococcic disease. It is desirable, however, to distinguish among several possible environmental factors: overcrowding, chilling associated with

use of central bathhouses in inclement weather, and fatigue or chilling associated with work. Reports in the literature differ on the relative importance of overcrowding in this disease.[6, 9-14] It is possible that one of the causes of such disagreement stems from differing definitions and uses of the word "overcrowding." For example, one of the most precise studies supporting the importance of overcrowding was by Glover in a British Army camp.[11] But overcrowding as extreme as that defined by Glover did not, in general, exist among occupants of slums in Oak Ridge. Yet, as indicated earlier in this report, overcrowding was one of the criteria differentiating slum from standard dwellings, in accordance with definitions of the A.P.H.A. Committee on the Hygiene of Housing.

In the usual community, standard and slum housing are closely associated with the economic status of the occupants. Such an association did not exist appreciably in wartime Oak Ridge. Employees of construction companies were generally assigned slum housing, including personnel with high incomes or professional status, whereas operating company employees received preference for standard housing. Thus economic status was not a significant factor in accounting for the difference in rates between standard and slum housing. But work conditions, such as greater exposure to the elements plus possible fatigue resulting from long work hours in the rush of construction, might have contributed to the higher rate among slum dwellers.

Since men are more subject than women to exposure at work and to other work conditions, the magnitude of this factor might be estimated through the sex ratio. Certain studies of meningitis indicate that the sex ratio in the childhood years is close to unity, but that male cases are several times more numerous than female cases above age 15 or 20.[8, 15] This excess for males in the working years may be attributed to the work conditions of men outside the home. A breakdown of the Oak Ridge data by dwelling type, color, age, and sex is given in Table 2. It should be noted that male cases far outnumber female cases in the adult years in all three dwelling groups, white standard, white slum, and colored slum, but in the childhood years. the differences in numbers between the sexes are not so extreme. However, two restrictions apply in the interpretation of these data. First, the male population at risk in the slum dwellings probably exceeded the female population. Second, the differences in this fine breakdown are not statistically significant, possibly due to smallness of numbers.

TABLE 2

Meningococcic Disease: Cases by Age Groups, Sex, and Dwelling Types Oak Ridge, 1944–1946

White Standard

Age	Male	Female	Male/Female Ratio
0–19	3	5	0.6
20 and over	4	2	2.0
All ages	7	7	1.0

30 and over	4	9	6	19	25
Total	14	30	13	58 [a]	37

[a] Includes one Oak Ridge case with dwelling type unknown.

TABLE 4

Meningococcic Disease: Populations of Permanent Residence by Cases, Median Lengths of Residence Prior to Onset, and Percentages of Oak Ridge Cases and of United States Population

Population of Permanent Residence	Oak Ridge Cases 1944–1946: Number	Median Length of Residence Prior to onset (in months)	Percentage	Percentage in United States Population 1940
Less than 2,500	25	4	43.9	43.5
2,500–9,999	9	5	15.8	8.9
10,000 and over	23	5	40.3	47.6
Total	57 [a]	4	100.0	100.0

[a] Does not include one infant born in Oak Ridge.

are given in Table 3. They varied from 72 in the below 15 age group to 25 in the over 30 age group, with a rate of 37 for all ages combined. When the combined rate was adjusted according to the 1940 United States population, it increased slightly from 37 to 39. Also as indicated in Table 3, the proportion of cases below age 15 to cases 15 and over was practically the same in white standard and in white slum dwellings.* Thus the variation by age was not markedly different from that reported in other studies on civilian populations nor anomalous in other respects. [7, 13, 15–18]

A related question is the development of immunity to meningococcic disease as a result of prior exposure to the organism. Certain studies have suggested greater susceptibility of persons migrating from rural to urban conditions.[5, 19] These observations could be, at least in part, manifestations of the effects of housing rather than susceptibility, since rural persons migrating to cities for the first time might, in general, have substandard housing. In addition, some authors have pointed out that in military life, new recruits are particularly susceptible to the disease.[20, 21] It seemed desirable to study separately the influence of each of the factors, housing, rural origin, and "newness" in the community.

Information regarding population of permanent residence was collected for the cases (Table 4). If similar information as to size of place of origin had been available for the population at risk, attack rates could have been calculated by place of origin. Since this informa-

* There were no cases among colored children. Prior to the middle of 1946, there were practically no colored children in Oak Ridge due to the lack of even the most meager colored family housing facilities. Considering the high rate in the colored adult population and among white children, it is a reasonable presumption that had colored children been present in Oak Ridge in appreciable numbers, the rate among them would have been very high.

TABLE 5

Meningococcic Disease: Median Length of Residence of Cases (Prior to Onset) and Population in Several Dwelling Types, Oak Ridge, 1944–1946

Group	Median Length of Residence in Dwelling Type (in months)		
	White		Colored
	Standard	Slum	(Slum)
Cases prior to onset	8	4	1
Population	17	5	—[a]
Ratio: *Case*/Population	8/17	4/5	—[a]

[a] Estimate unavailable.

tion was not available, it was of interest to compare the percentage distribution of the cases, by population groups, with the percentage distribution of the U. S. population by the same groups. Very close similarity was found. While certainly not conclusive evidence, this would perhaps indicate no greater likelihood of illness in one group than in another. Further analysis was done by comparing the intervals between arrival in Oak Ridge, representing arrival into urban conditions, and date of onset. If persons of rural origin were more susceptible, one might expect illness in this group to be relatively more concentrated in the early months after arrival. The fact that no significant difference was found in median lengths of residence prior to onset would also seem to indicate no difference in susceptibility.

It was thought possible that evidence of greater susceptibility might be found in persons of rural origin if this type of analysis were made separately for the various dwelling types. Accordingly, length of residence was studied in relation to place of permanent residence with the type of dwelling under statistical control. Again no significant relationship was found, i.e., differences in susceptibility could not be demonstrated, possibly due to small numbers.

A further index of comparison is presented in Table 5. The ratio was computed of the median length of residence prior to onset to the corresponding median for the population in each dwelling type. If in the slum dwellings, there were a greater probability of illness in the early months as contrasted to later months, this ratio would be lower in the slums than in the standard dwellings. However, the computed ratios, 4/5 in slums and 8/17 in the standard dwellings, do not indicate such a relationship.

SUMMARY

The present study was undertaken to determine factors associated with the incidence of meningococcic disease in Oak Ridge. In the course of the study, it was necessary to delimit the effect of factors such as housing, age, sex, race, and latent immunization. Mass construction of housing according to specific types facilitated classification of housing in accordance with definitions of the A.P.H.A. Committee on the Hygiene of Housing. Wide differences in rates among several housing groups were demonstrated.

The rate in the white slum group was significantly higher than the rate in the white standard group. In one slum area, the rate in the colored dwelling group was shown to be significantly higher than the rate in the white group having comparable housing. The effect of environmental conditions was considered, and an attempt made by statistical analysis to determine the influence of such conditions. These conditions, including both housing and work, were studied in relation to age, race, and the sex ratio. The problem of susceptibility and im-

munity was studied from two perspectives: (1) rural versus urban origin, and (2) interval of time preceding onset of illness after arrival into the urban conditions of Oak Ridge. Each of these perpectives was considered in relation to dwelling type.

Limited success was obtained in the analysis due to the unavailability of certain important population statistics. Also, it may be that in the precise analysis which was undertaken, additional significant relationships might have been found had larger numbers of cases been available. Since mass shifts of the American population may be expected to continue in the future, environmental conditions such as existed in Oak Ridge may be duplicated elsewhere. Thus, the statistical methods of approach used in this paper are offered as potential means for future study of this disease.

APPENDIX

The statistical test used to determine the significance of the difference between two rates p_1 and p_2 was

$$t = \frac{p_1 - p_2}{\sqrt{pq\left(\frac{1}{n_1} + \frac{1}{n_2}\right)}}$$

referred to a normal probability table, where p is the probability of the hypothetical universe, $q = 1 - p$, and n_1 and n_2 are the populations in the two compared groups. With q assumed equal to unity, the denominator of this fraction becomes

$$\sqrt{\frac{m_1 + m_2}{n_1 n_2}}$$

where m_1 and m_2 are the numbers of cases in the two groups.

In parts of the analysis where interrelationships between classes of cases could be represented by fourfold tables, R. A. Fisher's exact treatment of 2 x 2 tables was used.[22]

ACKNOWLEDGMENTS: Drs. Stafford L. Warren and A. H. Holland, Jr., assisted materially in facilitating compilation of the data. Dr. John De Persio reviewed all questionable diagnoses. Helpful suggestions and criticisms were contributed by Drs. C.-E. A. Winslow, Hollis S. Ingraham, and Robert F. Korns.

THE SEVENTY-SEVENTH ANNUAL MEETING

FEW who attended the sessions at New York October 24–28 will challenge the conclusion that this Annual Meeting was "tops" both in quantity and quality. The registration of over 5,300 exceeded by about 1,000 any previous registration in the history of the Association. There were 59 different sectional meetings, 39 of them sponsored by a single section, 6 by two sections, 5 by three sections and 9 by from 4 to 7 sections respectively. In addition there were held during the week 24 meetings of various committees of the Association. Those who have enjoyed the privilege of attending meetings of our three major Standing Committees cannot have escaped a thrill of pride in the service rendered by members of this Association on our committees throughout the year. Research and Standards has some 200 working members on its various subcommittees; Administrative Practice has 150; and Professional Education an almost equally large number.

The new method of electing members at large of the Governing Council by letter ballot, instead of at the Annual Meeting itself, proved highly satisfactory. A total of 1,370 valid ballots were cast, representing more than 70 per cent of the total fellowship roll, three times the number of ballots cast at the last Annual Meeting. Dr. Lowell J. Reed, as President-Elect, succeeds Dr. Wilinsky as President. The Governing Council named Dr. W. P. Shepard as President-Elect, a choice which was hailed with unusual enthusiasm. It is an honor, well deserved for many services to the general cause of public health and, particularly, by Dr. Shepard's inspiring leadership of the Committee on Professional Education. Dr. Herman E. Hilleboe was chosen as Treasurer, succeeding Dr. Louis I. Dublin who has served the Association in this capacity with remarkable devotion for a quarter of a century. The Annual Banquet was a warm and delightful "family affair," marked by the President's address, the presentation of certificates to a distinguished group of members who have completed forty years of association with us, and the award of the Sedgwick Memorial Medal to Dr. Henry F. Vaughan, whose name adds new luster to the roll of his predecessors who have received this honor for "distinguished service in public health."

Perhaps the most striking event of the meeting was the remarkable development of the new Section on Medical Care, created a year ago. This Section held eight sessions, five of them conjointly with other Sections. Its meetings were jammed to the doors. Specially notable sessions were those devoted to regionalization of medical services (illustrated particularly in Michigan and in the program of the Bingham Associates); to rehabilitation; and to a discussion of the British National Health Service (led by four distinguished English guests).

Three of our Sections celebrated birthdays this year. The Laboratory Section held a Fiftieth Anniversary dinner, at which a group of elder statesmen (with membership dating back to 1902) recalled the bacteriology and the bacteriologists of earlier days. The Industrial Hygiene Section (thirty-five years of age) presented a symposium under the title "Industrial Hygiene Marches On," besides Chairman W. G. Fredrick's address on the significance of the anniversary. The Epidemiology Section celebrated its Twentieth year in an even more impressive manner through a carefully prepared program on "The History of American Epidemiology"; and, particularly by a luncheon in honor of its most eminent Fellow, Dr. Haven Emerson, on the occasion of his seventy-fifth birthday. Dr. Emerson was, on the whole, distinctly "Queen of the May" this year, for in addition to this luncheon, he received two other signal honors, a Lasker Special Award at the Tuesday General Session, and the publication of a volume reprinting a collection of some of his more important contributions to the philosophy and the practice of public health.

It is impossible, here, even to mention more than a tiny fraction of the valuable papers presented at the 59 sectional meetings. As many as space permits will be presented to our readers in subsequent issues of this JOURNAL. Problems of air sanitation and the remarkable progress now under way in the eradication (not merely the *control*) of insect-borne diseases was reviewed by the engineers; the Academy of Pediatrics study of Child Health, the problems of prematurity and antepartum care, by the specialists in maternal and child health; those of food and nutrition during pregnancy, and of the use of isotopes in nutrition research, by the experts in food and nutrition; those of research in dental caries and of the effects of fluorination by the dentists.

Finally, a word should be said about the session on Integrating Mental Hygiene Concepts into Public Health Programs, sponsored jointly by the Health Officers, Public Health Education, and School Health Sections (as well as by the American School Health Association), in coöperation with the National Committee for Mental Hygiene. The audience at this session was probably the largest ever brought together in an A.P.H.A. sectional meeting. The speakers on this occasion fully convinced their hearers that the days of merely talking about mental hygiene are past. This thrilling new area of public health has now developed a group of leaders who not only have at their disposal a solid basis of sound knowledge of the human mind, and a demonstrated body of techniques; but also the ability to give us that knowledge in a language we can understand and to place those techniques actually at the disposal of the health officer in his local field of service.

CLOSE OF THE EMIC PROGRAM

THE termination of the EMIC program on June 30, 1949, closed a gratifying and encouraging chapter in the history of medical care in the United States.

As our readers are aware, EMIC was a wartime program operated by the state health departments to give medical, nursing, and hospital, maternity and infant care to wives and babies of enlisted men in the four lowest pay grades, about three-fourths of the armed forces. Funds were supplied by Congress through the Children's Bureau within the framework of the Social Security Act. The fact may not be as clearly realized that, at its height, this program covered one out of seven of all births taking place in the United States. Its purpose was to give a serviceman assurance that his pregnant wife and his coming child would have good medical care, and that the cost would be paid for from general tax funds. Men returning from World War II did not face unpaid maternity bills as did those of World War I.

It is probable that the most important long-range influence of the program was its emphasis on quality of care, which not only affected the mothers and infants who received direct services, but raised the local level of maternal and child care in entire areas, where that level had before been low. Minimum standards were established for hospital, maternity, and new-born services for the first time, in many parts of the country. The EMIC medical advisory committees appointed by state and local health departments were a potent force in maintaining a high quality of medical care under the program by recommending standards of prenatal care, establishing lists of consultants competent in various specialties, and by urging the general practitioners to call the consultants who were made available under the program. Many mothers whose husbands were not in service learned from EMIC patients what to expect in the way of good medical care throughout pregnancy, at delivery, and after the baby's birth. They learned for the first time what good health supervision and medical care for an infant really is. More widespread appreciation of the value of hospital care as a result of the EMIC program was partly responsible for the fact that in 1947 the proportion of births occurring in hospitals reached a new high of 84.8 per cent, as compared with 72.1 per cent in 1943, an increase of almost one-fifth. This occurred in spite of the great post-war rise in the birth rate and the shortage of new hospital facilities.

All physicians were paid for their services, and though in some parts of the country the rates of payment were less than is customary in private practice, in other areas the rates were better than the pre-war average. Hospitals were paid on a cost basis, and they—like the doctors—had no "bad bills."

Since the principle was established under EMIC that payment by the state agency must constitute full payment to the hospitals and physicians, it was essential that rates of payment to physicians and hospitals be made equitable.

The per diem cost formula for payment to hospitals was accepted, in general, to a surprising degree. Incidentally, the fact that there was no additional payment for surgery (such as caesarean section) included in the program avoided any possible incentive to unnecessary surgical interference.

One of the most amazing features of the EMIC was the facility with which every state health department established the machinery for administering this medical care program, involving practically all physicians and hospitals in the state. Many of the patients were moving from state to state, and it was not found difficult to arrange for continuing care, since the programs, almost identical in scope, were in operation in all states. Although there were many complaints at one time about too much federal insistence on reasonable uniformity of the state programs, most of the states welcomed the fact that they did not have to negotiate locally without full support of the CB, with respect to the basic principles involved. The Chil-

dren's Bureau, with the best medical advice it could secure, had, of course, to bear the ultimate responsibility of seeing that care was made available under conditions which were as equitable as possible to all concerned.

The average cost during 1943–1948 of EMIC maternity cases completed was $92.49 for medical and hospital care, and for cases of infant care completed it was $63.89. The $127,000,000 paid to state health departments bought for almost 1¼ million mothers and their infants the health supervision and medical care they needed. State health departments learned that the cost of administration in such a medical care program was very low compared to the costs for service. Although accurate totals for state and local expenditures for administration have not been compiled, the states usually estimated them as considerably less than 5 per cent. The Children's Bureau administered its responsibilities for the program with its small pre-war staff, and it had no new funds except for three auditors rather late in the program. There is an immense amount of valuable factual information available to the state health departments which have the time and the money to finance the analysis of their medical and administrative records under the EMIC program. A few such studies have already been initiated. Public health workers will find a mine of information about the administration of EMIC in the report of a study made by the School of Public Health, University of Michigan, while the program was in full operation. Dr. Nathan Sinai directed the study and reported his findings in "EMIC—A Study of Administrative Experience." One of his conclusions summarizes well the administrative lesson to be learned from this wartime medical care program. "EMIC serves as a striking demonstration of joint effort and of administrative resiliency. It would be hard to find another wartime program that grew to such comparatively huge proportions and still remained within the framework of an existing national, state, and local peacetime administration. The accomplishments in meeting the problems, disregarding the antagonisms, conflicts, and fears, are a monument to the combined contributions of medicine, public health, and the hospitals. Maternity and infant care were the goals; maternity and infant care are the achievements."

THE KEY TO SLUM ELIMINATION

THE Federal Housing Act of 1949 is the outstanding contribution of the First Session of the Eighty-first Congress in the field of domestic legislation.[1] That contribution is a major one, which will provide hundreds of thousands of American citizens with those living conditions which are essentially basic for physical and emotional health.

The new housing to be provided under this Act during the next six years will be, in most cases, based on slum clearance and will require extensive and detailed knowledge of present substandard housing conditions, in order that maximum results may be attained. It is, therefore, fortunate that our Association Committee on the Hygiene of Housing has completed the third of its series of reports on an *Appraisal Method for Measuring the Quality of Housing*.[2] The Method of Appraisal developed in these reports gives us a reasonably complete and accurate quantitative rating of the character of each home and of a neighborhood as a whole. It provides the soundest basis for specific legal control of an individual structure; and the necessary background for wise community planning.

This procedure has been endorsed officially by the U. S. Public Health Service which is prepared not only to advise health officers, housing and redevelopment

authorities, and planning boards as to its application, but also to provide specific training for the men who are to direct a survey, either at Atlanta or in any locality where sufficient demand exists. The actual survey may be carried out by members of the regular inspection staff of any competent local health department, as has been demonstrated in over thirty cities, from Portland, Me., to Los Angeles, Calif. It is more and more widely recognized as a necessary continuing function of the local department of health.

The Committee on the Hygiene of Housing expects to continue its study of the Appraisal Procedure with a view to simplifying it still further. There are, however, no easy short cuts in the measurement of the factors involved. The data in the 1940 Census as to "structures in need of major repairs" have proved wholly unreliable; and the 1950 Census item, which we understand will record "dilapidated" can only add further to confusion. It is quite impossible to obtain any reliable data on this point from untrained census enumerators. Nor have the costly "survey programs" offered by private consultants proved of substantial value.

Housing is a primary health problem. The American Public Health Association committee has spent more than $50,000 in developing a procedure for the Appraisal of the Quality of Housing, based on fundamental health needs, which has been demonstrated as practical and reliable. Housing agencies may be under considerable pressure to adopt other procedures which are supposedly simpler but cannot yield valid and significant results. Where housing surveys are contemplated, the health officer is well within his rights in urging that the task be approached along sound scientific lines.

EUROPEAN MORTALITY RATES

A RECENT statistical report of the World Health Organization[1] contains a highly suggestive review of the death rates of fourteen Western European countries, from 1901 to 1947.

In 1901, the spread between various national rates was considerable. The lowest rates of deaths per 1,000 population were in Norway (15.0), Denmark (15.7) and Sweden (16.0). The highest were in France (20.1), Finland (20.6), Portugal (20.9), Italy (22.0), and Spain (27.8).[2]

In 1947, the lowest rates were reported for the Netherlands (8.1), Norway (9.3), and Denmark (9.7). The highest rates were reported for France (13.0), Belgium (13.1), Portugal (13.3), and Ireland (14.9).

The greatest reductions in the period were 58 per cent for Spain, 53 per cent for the Netherlands, 48 per cent for Italy, and 45 per cent for Finland. The lowest rates of reduction were 27 per cent for England, 24 per cent for Belgium, and 13 per cent for Ireland. That states with initially high rates, such as Spain, Italy, and Finland should show marked proportional decrease is natural; but the record for the Netherlands is highly creditable. That of Ireland is the most discouraging phenomenon in the picture.

A specially interesting feature of this tabulation is the effect of the war years.

Only five states showed clear evidence of such an influence, as indicated below.

	Highest Rate	*Year*	*Excess over Pre-war Rate*
Finland	19.0	1941	54%
The Netherlands	15.3	1945	53%
France	18.5	1944	25%
Belgium	16.1	1940	23%
Italy	15.9	1944	19%

WHO Foreign Study Fellowships

The World Health Organization is offering in 1950 9 to 12 fellowships for foreign study in the field of health to students from the United States. A Fellowship Selection Board, set up by Surgeon General Leonard A. Scheele, consists of Walter A. Bloedorn, M.D., Association of American Medical Colleges; Hugh Leavell, M.D., American Public Health Association; and Joseph W. Mountin, M.D., Public Health Service; with H. R. O'Brien, M.D., of the Public Health Service as secretary.

For 1950, applications will be considered in the fields of public health administration, malaria, tuberculosis, maternal and child health, venereal diseases, sanitation, nutrition, and mental health.

Applicants must be engaged in some form of full-time public health work, including medical or nursing education. In evaluating applications the Board will take into account the ability of the individual and the value to his community or his country of the training he will receive abroad. Special consideration will be given to such persons as those in charge of training centers or teachers in medical or other schools (especially in Preventive Medicine or Tropical Diseases). An advanced degree or Board certification is desirable. Knowledge of the language of the country to be visited is valuable. In general, non-federal workers will be preferred.

Grants are for periods of from 2 or 3 months for observation, up to 12 months for study. WHO provides transportation and a monthly stipend of $200 for those studying in one place, $300 for those moving about. For the 1950 fellowships, applications must be filed in triplicate by March 1, 1950. Application blanks may be obtained from the Educational Programs Branch, Office of International Health Relations, U. S. Public Health Service, Washington, D. C.

Seven fellowships already awarded for 1949 include the following:

Teachers of preventive medicine in undergraduate medical colleges:
Lloyd Florio, M.D., University of Colorado
Edward A. Krumbiegel, M.D., Marquette University

Tuberculosis rehabilitation:
William A. Winn, M.D., Tulare-Kings County (California) Sanatorium

Training of dental hygienists in New Zealand:
John Fulton, D.D.S., U. S. Children's Bureau

Engineering curricula in Europe:
Professor Harold B. Gotaas, University of California

Nutritional study in Great Britain:
A. Hughes Bryan, M.D., University of North Carolina

Local Health Officer:
John Thrash, M.D., Muskogee County, Georgia

Clearing House on Public Health Salary Information and Personnel Needs

A THIRD STATE SALARY STUDY

The third in a series of annual studies of state health department salaries made by the Public Health Service in coöperation with the Association of State and Territorial Health Officers and the American Public Health Association has just been released. As in earlier reports the material is shown almost entirely in tabular and graphic form with little interpretive analysis. The study thus constitutes in effect the raw data from which can be selected material for further analysis to meet specific needs. As an aid to specialized analysis, tabular data are shown by Federal Security Regions.

Aside from the fact that statistical personnel are included for the first time, the present report is significant chiefly because it is now possible to spot at least short-time trends. There is no questioning the fact that public health salaries are rising; whether sufficiently or fast enough, to be determined by specific local or regional conditions. Median salary ranges for each group have increased; from 7 per cent for professional laboratory workers to nearly 50 per cent for sanitation personnel apart from sanitary engineers. Medical personnel salaries, apart from health officers, have increased nearly one-fourth in the 3 year period.

Program directors' average salaries have increased from 11 per cent for laboratory directors to 20 per cent for directors of local health services, of tuberculosis control, and of public health nursing. Average salaries of health officers increased 18 per cent. Probably for reasons not far to seek, among medical program directors the lowest paid and the smallest percentage increase were reported for directors of maternal and child health services; similarly the lowest paid of all program directors in 1947 were public health nursing directors, although by 1949 they had yielded this distinction by a small margin to vital statistics directors.

In the current study 6 state health officers are reported with salaries of $12,000 or more; in 1947 there were but 2, and in 1948, 4. The latest study reports 18, or more than a third of the state health officers, receiving $10,000 or more annually; in 1947 the number was 4, and in 1948 it had reached 14. These figures are but sample illustrations of the type of material that can be found in this series of studies. Comparisons in terms of neighboring states, similar population groups, similar economic status, or comparable positions can be selected from this material for use with appropriating and citizen bodies. For example, the relative rank of a state in terms of the salary paid to the different types of program directors may have a number of implications not all of which point to disparity.

This latest study is available for distribution in limited quantities from Committee on Professional Education, A.P.H.A., 1790 Broadway, New York 19.

LABORATORY SALARIES

Salary information for professional laboratory personnel of state health departments as of July, 1949, has been compiled by C. A. Perry, Director of Laboratories of the Maryland State Health Department and is published in the September *The Public Health Laboratory*. This, it will be remembered, is the Bulletin of the Conference of

State and Provincial Public Health Laboratory Directors. This material is a valuable supplement to the state salary study discussed above in that it analyzes salaries for laboratory workers in five position classifications below that of director. It also shows position titles separately for those states whose classifications do not fit the pattern adopted. The editor of *The Public Health Laboratory* is Edmund K. Kline, Box 573, Olean, N. Y.

A SECOND SURVEY BY LOUISIANA

The Louisiana State Health Department in January, 1948, made a telegram survey of salaries for 30 classes of positions common to state health agencies. As of September, 1949, it repeated the survey, this time for 71 different classes of positions, many of them found in only a few of the 43 states included in the study. A careful comparison of salaries for titles that are common to the two studies should throw some light on whether it has been a useful means of making state fiscal officers "salary conscious" and thus presumably of raising the general level of Louisiana's public health salaries. It is to be supposed that the study is available from the Louisiana Merit System, Capitol Annex, Baton Rouge, La. The revised compensation plan effective January 1, 1950, is definitely offered to readers.

HOSPITAL SALARY SURVEY

The 4th consecutive annual hospital salary survey covering the year 1948 was recently published by the American Hospital Association. "For all categories of personnel surveyed," it says, "salaries increased approximately 10 per cent in 1948 over 1945." Only 5 categories of personnel are included but they represent the large majority of hospital employees, general duty nurses, untrained women, untrained men, clerks, and practical nurses. Of more than 4,600 hospitals receiving questionnaires 53 per cent replied. Detailed analysis of data by state and region, by size of hospital and community, by type of hospital and type of ownership results in 131 statistical tables.

OCCUPATIONAL OUTLOOKS

Recruitment, counseling, and personnel officers should be aware of the fact that the Bureau of Labor Statistics of the U. S. Department of Labor has an occupational outlook research program. Through this program it attempts to make information generally available on relative opportunities in various occupations. Although it is largely devoted to industrial occupations it has limited relevance for public health as well.

Bulletins 863 and *881,* published in 1946, are on Postwar Outlook for Physicians and Factors Affecting Earnings in Chemistry and Chemical Engineering respectively. Currently in press is Employment Outlook for Engineers.

The Occupational Outlook Handbook — Employment Information on Major Occupations for Use in Guidance is a comprehensive 454 page report originally prepared for use by the Veteran's Administration, but brought up to date in 1949 for general use in guidance agencies. Each of these is available from Superintendent of Documents, Govt. Ptg. Office, Washington 25, D. C., the bulletins at 10 cents each, the book at $1.75.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted.

Mental Hygiene in Public Health —*By Paul V. Lemkau. New York: McGraw-Hill,* 1949. 396 pp. Price, $4.50.

This volume is largely based on Dr. Lemkau's course in mental hygiene, and its dual dedication to Adolf Meyer and Allen W. Freeman, indicates its two-fold source of inspiration in the visions of these leaders of psychiatry and of public health.

Mustard has told us that "a health problem becomes a public health responsibility if or when it is of such a character as to be amenable to solution through systematized social action." These conditions are fully met in the challenge presented by mental and emotional abnormalities; and mental hygiene was listed by eight of our state health departments in a recent issue of this *Journal* as among their chief program objectives at the present time. Connecticut established the first division of mental hygiene in a state department in 1920; and the U. S. Public Health Service created a division of mental hygiene in 1930. Dr. Lemkau points out that the relations between psychiatry and public health have been for the most part "immature and perhaps idealistic." ("Immature" is a harsh word, in the language of modern psychiatry!) This is due on the one hand to the fact that most psychiatrists of an older generation, preoccupied with the advanced and often hopeless case, had nothing to offer along lines of prevention; and, on the other hand, to the lack of training in most schools of public health of the kind offered by Dr. Lemkau at the Hopkins.

Dr. Lemkau's basic thesis is, of course, that the human personality is of primary importance in individual and social health; and that this personality, at a given moment, is the result of interaction between the hereditary basis of personality structure and the total of life experiences impinging on that structure. To control these environmental factors is a legitimate and ultimately inescapable task of public health. The reviewer believes that the modification of such stresses and the guidance of the individual in meeting them successfully is sure to be recognized ultimately as even more important (even if also more difficult) than the measures now taken for the prevention and early treatment of infectious and nutritional diseases.

The bulk of Dr. Lemkau's book is devoted to an exposition of the nature of this problem as it should be understood by the health officer. It is not highly technical psychiatry (or the present writer could not have undertaken its review). Neither is it one outline of health department machinery for mental health services. It is a clear and non-controversial outline of what the common emotional maladjustments are, and what personal counseling and family and social adjustment may do to create and preserve mental health. These problems are reviewed as they present themselves at chronological phases of the evolution of the individual. Chapters deal, in detail, with the Prenatal and Natal Period, The Period of Infancy, The Pre-School Period, The School Period, The Adolescent Period, The Young Adult Period, The Period of Middle Age and the Period of Old Age. This type of presentation will appeal directly to the various health department specialists in obstetrics, pediatrics, school health, venereal disease control, tuberculosis control, geriatrics, and the like. In many cases, the points made

are illustrated by well chosen and effective case histories.

There is nothing startling or dramatic about this book. It will not make the headlines, like a speech by Chisholm. We believe, however, that the public health worker, physician, nurse, educator, engineer, who reads this book will find his understanding of basic mental hygiene problems clarified and his recognition of those problems quickened. The success of every health department clinic, in whatever field, depends on mental hygiene. The core of the work of every good public health nurse is mental hygiene. Such new procedures as childbirth without anesthesia, and rooming-in for infants are primarily mental hygiene technics. The effectiveness of all health education depends on mental hygiene. The sound administration of a health department and the public relations of such a department require the applications of mental hygiene.

To all our readers then—and also to the intelligent citizen who is not a professional public health worker—we heartily recommend *Mental Hygiene in Public Health.* C.-E.A. WINSLOW

Office Management for Health Workers—*By Frances King and Louis L. Feldman. New York: Commonwealth Fund,* 1949. 158 pp. Price, $2.25.

With the progressive extension of public health activities and services to the relatively unsettled and rural areas of the nation, the need for specific instruction in basic office management has become acute. While in the cities and urban areas a public health department often has available the advice and facilities of well organized and experienced governmental units, as well as commercial resources, the outlying areas have been left to their own ingenuity and imagination in the organization and operation of the unavoidable office management functions.

Office Management for Health Workers provides a valuable resource and reference book for public health workers who must set up administrative procedures and office facilities. The elementary guideposts are carefully outlined, with helpful suggestions as to the practical aspects of operations. Written in a clear and exceedingly readable style, public health administrators will gain from reading this book a stimulation to perform tasks the "easy" way.

The authors begin by presenting some cogent observations relative to the operation of an office. Following are matter-of-fact outlines of the physical set-up and equipment of an office, the fundamentals of form design and a discussion of files, reports, records, histories, surveys, and certain other operations that transpire in public health and, indeed, in most offices. While some of the material in the book appears somewhat obvious and routine, no doubt it is helpful, even to veterans, to review the accepted procedures and well established methods which seldom have been documented. But the principal value of a study of the book will be for the beginners in the office management field who will find in it a wealth of practical information. ROBERT G. WEBSTER

Rural Welfare Services—*By Benson Y. Landis. New York: Columbia University Press,* 1949. 201 pp. Price, $3.00.

Dr. Landis, who is now Executive Secretary of the Committee on Town and Country, has worked on the betterment of rural life for many years. Against a background of the general sociology of rural life and the trends in its development of social services, his book gives succinct descriptions of the principal federal, state, and local programs—official and voluntary—designed to promote security and "the good life" for country dwellers.

The description of the administration

of the programs of old age and survivors' insurance, veterans' benefits, and public assistance, categorical and general, are relevant for workers in city and country alike. Red Cross activities and voluntary efforts in youth services and recreation are described with enthusiasm. The fundamental and far-reaching services of the Farmers Home Administration and the Agricultural Extension Service, on the other hand, are given less relative attention perhaps than is warranted.

Considerable space is devoted to health services in rural areas. The data on public health organization and coverage are well presented, but the account of the difficulties in rural medical care is somewhat topical, rather than comprehensive. It is regrettable to find the vast and basic subject of nation-wide medical care insurance described as having been "agitated" and disposed of in a terse six lines.

As a brief manual for health workers who want a birdseye view of welfare programs in their communities, the book should prove useful.

MILTON I. ROEMER

My Place To Stand—*By Bentz Plagemann. New York: Farrar, Straus,* 1949. 241 pp. Price, $2.75.

This is a psychological biography with a strong religious bent of the process of reaching maturity through the experiences of the Navy and poliomyelitis. The author is a sensitive and introspective individual. The book is described as a "biography of an illness" and part of it certainly is. The first 175 pages are the account of the problems of adaptation to the war and impending combat. A substantial part is concerned with life at the Warm Springs Foundation.

The book is most interesting, but it is not comfortable to read. The discomfort arises from two sources. Rapid swings from philosophical heights to the mundane or even trivial is one source. The other is that the reader rather often has the feeling that he is eavesdropping on a mental therapy session. A trivial irritation arises from the consistent misspelling of "tuberculous."

Several concepts will provoke discussion among physicians and public health workers. There is an opportunity to gain insight into the medical care in the armed forces and how it is regarded by a patient. Character changes resulting from the disciplines of an attack and recovery from "polio" are explored and changes in President Roosevelt are considered. The possibility of an attack of poliomyelitis being in part due to psychic factors or some other guiding force is provocative. It is interesting to note that the incubation period seems to have been the usual one.

The work is useful in stimulating the reader to do some thinking about his own relevant notions and in extending the understanding of readers regarding infantile paralysis. Writing the volume was probably a valuable experience for the author in understanding himself. It could be an interesting case study for inservice training sessions for a variety of social scientists.

ROSCOE P. KANDLE

Epilepsy and Convulsive Disorders in Children—*By Edward M. Bridge, New York: McGraw-Hill,* 1949. 670 pp. Price, $8.50.

Epilepsy is primarily a disorder of childhood, yet, judging by volume of writing, pediatricians have been little interested in it. Jean Taxil's 300 page book, *De L'Epilepsie—aux petits enfants,* printed in French in 1602, has had no worthy successor. The book by Bridge makes good much of this deficiency.

The original contribution made by this work is statistical, a study of 742 children with seizures seen at a clinic at the Harriet Lane [illegible]
This core of solid
realistic and bala

etiology and the various manifestations of epilepsy, particularly the physical and psychological aspects.

The general application of these data is somewhat impaired by the clinic selected cases, institutional patients, and those of the "private patient" category being excluded. Also much of the conclusion-based information was gathered prior to the discoveries in neurophysiology and drug therapy of the last few years. Thus, abnormal cerebral circulation is still viewed with suspicion as an immediate cause of seizures.

Electroencephalography receives a well written 20 page discussion, but the lessons of this technique are not integrated with the background thinking of the book. The sections on the social personality and psychological problems are particularly well done—and rather overshadow discussions of direct therapy. Thus, against 60 pages given to psychotherapy, there are 8 on the use of drugs, of which bromides receive the most attention and mesantoin only passing reference. Some 45 pages are given to the now little used fasting and ketogenic diet.

The attitude toward epilepsy is refreshingly optimistic and constructive. A mass of useful information is presented. The language is simple and clear and not above the understanding of the intelligent lay reader, whose interest presumably will be stimulated by numerous poster-like illustrations. The 36 figures are clearly drawn and pertinent. References conclude each chapter and are assembled at the end. Altogether this book should be in the hands not only of pediatricians and doctors, but large portions can be read with benefit by social workers, school teachers, and all those who deal with seizured children.

WILLIAM G. LENNOX

Heating, Ventilating, Air Conditioning Guide, 1949—*New York: American Society of Heating and Ventilating Engineers,* 1949. 1,384 pp. Vol. 27. Price, $7.50.

This, the 27th Edition of the Guide, brings previous issues up to date. Twenty-four of the 52 chapters have had appreciable changes or additions made to them. The chapters on "Physiological Principles," and "Air Conditioning in the Prevention and Treatment of Disease," should be of interest to the general public health worker. The balance of the volume should also be of interest to the engineering personnel on the public health staff—including the industrial hygiene engineer, whatever be his assignment.

As in previous volumes, principles are considered first, followed by a discussion of human reaction to atmospheric environment. Methods of computing heating and cooling loads; heating systems and equipment; air conditioning; and special applications complete the list of general topics. Each chapter is followed by an extensive bibliography, including 1948 references. Not least valuable is the final quarter of the volume, some 400 pages, which is given over to advertisement of equipment, materials and publications. FRANCIS B. ELDER

A Boy Grows Up—*By Harry C. McKown. (2nd ed.) New York: McGraw-Hill,* 1949. 333 pp. Price, $2.40.

Helping the teen-age boy in his transition from boyhood to manhood is a most worthy objective. The success of this book in its first (1940) printing has inspired McKown to the additions and rewriting which make this second edition of even greater usefulness. His case stories are well chosen, his practical advice good, and his twenty-page bibliography is one of the best we have seen. It is the kind of book, though, that a youngster would read for profit rather than pleasure.

Lest the volume—because of its title—be considered merely a social hygiene compendium, let us say that it deals with

manners, recreation, vocational guidance, health, and ethics. In fact its organization is more sociological than physiological. But such old reliable subjects as reproduction, petting, and getting along with the "whimsical female" are dealt with soundly and accurately, although with occasional reversions to ancient attitudes. In one of his paragraphs on "Your New Maturity" (p. 210), for example, the author says, "Having intercourse with prostitutes . . . is the main source of several body-destroying, mind-destroying, and soul-destroying diseases." That is all. He does not name the diseases nor give any better defined reference.

The book is one that might well be included in every library—home, church, or school—where boys either browse or borrow books. Many lads, however, will wish it were less textbookish and more "whodunit" in style.

RAY H. EVERETT

Food Poisoning—*By G. M. Dack. (rev. ed.) Chicago: University of Chicago Press,* 1949. 184 pp. Price, $3.75.

Written by an author more familiar with the wide scope of the field than any other in the country, this revised edition summarizes present knowledge of food poisoning in a comprehensive and detailed manner. The author discusses many laboratory procedures which have been proposed for use in investigating outbreaks due to the various agents discussed. His personal experience in the use of many of these makes his appraisal of them invaluable to the reader.

The general treatment is in language understandable by the average reader, but many may become entangled in the scientific details and find it necessary to leave portions to those with special training. The book is, therefore, invaluable to the epidemiologist and laboratory worker, who must discover the etiology and source of food-borne outbreaks, and collect information which can guide, control measures. It can be read with profit, however, by many other health workers, including sanitarians and food inspectors.

Selected references to the literature make it possible for the reader to explore most of the subjects further and obtain additional details when needed. There is an author index as well as a subject index.

ROY F. FEEMSTER

A Baby is Born—The Story of How Life Begins—*By Milton I. Levine, and Jean H. Seligmann. New York: Simon and Schuster,* 1949. 54 pp. Price, $1.50.

Public health people and educators will be able to tell mothers, "There is a new book that will help answer the 'How did I get here?' questions." Much credit for its attractiveness goes to Eloise Wilkin, artist, whose illustrations of babies and children are charming. It is written primarily for early elementary years.

The really inquisitive child may be interested in the fish, hen, and cow sequence of how the sperm gets to the egg. What we have here is a variation of the birds, bees and butterflies theme. Since today in our urban culture relatively few children have an opportunity to observe the mating of fish, hens, or cows, it is doubtful whether such comparisons really help explain the puzzle of human coitus. The experience of some reproduction education specialists shows that many little children are quite willing to skip such explanations.

Those who believe in the concept of "developmental tasks" will question the "telling everything" to very little children. Growth of a warm, satisfying child-parent relationship is of much greater importance in reproduction education (and in later years in genuine sex education) than "all the facts."

It might be well if people who were going to write books on sex education would ask psychologists for answers to such questions as these: Do diagrams of

the reproductive organs of man and woman mean much to little children? Should we write about "pains" or "contractions" or discover another way of explaining birth? Is the explanation of human coitus either necessary or accurate enough to be helpful to youngsters? Parents say: "We were told little or nothing. Should we tell our boys and girls everything?" Parents need help on developing a philosophy about reproduction and sex education more than they do books on the "facts." This book is essentially one that deals with the "facts."

It is good to find the love of father and mother for each other and their wanting children emphasized. Depending on their cultural backgrounds, some parents will find the book useful; others will not be able to use parts of it.

DAVID B. TREAT

Public Health and Hygiene—*By Charles Frederick Bolduan and Nils William Bolduan (4th ed.) Philadelphia: Saunders,* 1949. 423 pp. Price, $4.25.

"Public health is purchasable; within natural limitations a community can determine its own death rate." This statement by Biggs, so aptly utilized in the text by the authors, gives the key to the *Why* of Public Health.

As an elementary treatise, *Public Health and Hygiene* will prove invaluable to the beginning student and to the laymen who wish a painless method of studying the subject.

The organization of the book into the five main sections is quite logical. First, the general introduction offers a valuable survey of medical history, most interestingly developed, with the fundamentals of bacteriology, entomology, and nutrition. However, Chapter 8 on Social and Economic Factors in Public Health is the highlight of this first section.

The More Important Communicable Diseases, Section 2, are concisely described and their relative importance revealed. The discussion of causative agents and their mode of spread aids greatly toward the better understanding of control methods. The Important Noncommunicable Diseases and Conditions of Section 3 are treated in the same terse manner.

Section 4, Community Hygiene, covers the elements of environmental sanitation, relating these to industrial hygiene. Maternal and Child Hygiene, School Health, Public Health Nursing, and Health Education are considered in this overall survey of community problems.

Health Administration, comprising the last portion of this study, evaluates administrative control of health measures in terms of organizations, economics, and methods. It gives the reader substantial insight into the federal and state administrative functions in the field of public health, without losing his interest in a maze of bureaus, departments, etc.

One is a bit disappointed that more was not written on a positive approach to mental health, and the importance of the family in preventing mental difficulties. Likewise, the notes on health education failed to emphasize the importance of coördinating community organizations, facilities, and individuals to work together toward the ultimate goal of optimal health for all.

The authors should be congratulated on this study, so pertinently packed with informative data, statistics and observations on the general field of public health.

W. W. STILES

Accident Facts—*By the National Safety Council. Chicago: National Safety Council,* 1949. 96 pp. Price, $.60.

Public health workers again are indebted to the National Safety Council for the 1949 edition of *Accident Facts.* The increasing recognition of accident prevention as a fruitful and proper function for health departments makes this book particularly useful. The terms used in this publication are carefully defined.

Dickinson's claim that accidental deaths cause more loss of working years than any disease is presented.

This is an outstanding record of the epidemiology of accidents where one will find geographic, seasonal, age and occupation studies, together with estimates of frequency and of severity in various occupations. According to this record, the frequency rate for occupational injuries was down 13 per cent from the preceding year, 1947, and the severity rate down 9 per cent. The downward trend of motor vehicle deaths on a mileage rate basis continues to be encouraging. REGINALD M. ATWATER

The Natural History of Mosquitoes—*By Marston Bates. New York: Macmillan,* 1949. 379 pp. Price, $5.00.

This beautifully written volume is an interesting and orderly presentation of facts concerning the environment and behavior of mosquitoes. Because of the necessity of identifying and controlling species which are dangerous vectors of disease, a large literature has accumulated concerning these and other aspects of mosquito lore, including ecology and physiology. Much of this incidental information is sequestered in specialized scientific journals rarely seen by students of biological theory. Dr. Bates invites attention to this rich but relatively unexploited source of knowledge about mosquito behavior. He believes this should be especially valuable to those interested in speciation, taxonomy, organic diversity and evolution, population dynamics, etc.

The content of the book falls into three main categories. Following the introductory section, the first eleven chapters—almost three-fifths of the total text—deal with the environmental and functional responses of mosquito adults, eggs, larvae, and pupae. The next three chapters—one-sixth of the text—are an excellent discussion of the relations of mosquitoes to other organisms, especially in the vectoring of pathogens. The third section presents the species problem, information concerning classification and distribution of mosquitoes, techniques in mosquito study, and the strategy of mosquito research as the author views it. The Appendix includes a systematic list of mosquito species, a 45 page bibliography, and an index.

Throughout the book, the factual content is enlivened and enriched by the author's comments, interpretations, and conclusions, the fruit of his unhindered reflections in the llanos of Colombia.

While avowedly written to catch the eye of "academic biologists," *The Natural History of Mosquitoes* is highly recommended to medical and other entomologists, parasitologists, malariologists, virologists, epidemiologists, and students of tropical medicine and hygiene. They are certain to find passages of special interest to them, but the reviewer's bet is that they will read the entire book with interest and appreciation. JUSTIN M. ANDREWS

Toxic Eye Hazards—*A Manual Prepared by the Joint Committee on Industrial Ophthalmology of the American Medical Association and the American Academy of Ophthalmology and Otolaryngology—Publication 494. New York: The National Society for the Prevention of Blindness,* 1949. 101 pp. Price, $1.00.

The injurious effects of solid substances striking the eyeball have long been recognized in the American safety movement. In certain segments of American industry, great strides have been made in the protection of the workers' eyes against such solid flying materials.

The tremendous growth and complexity of the chemical industry has served to increase the eye hazard in this industry. For a long time there has been a real need of a compilation of the effects of chemical substances on the eyes.

The present pamphlet is very timely in that it fills this gap in the American industrial hygiene literature. The effects of organic compounds, inorganic compounds, and miscellaneous compounds and materials are set forth in tabular form, along with references to the basic information from which the tables have been prepared.

A very brief outline of emergency and first-aid procedures in chemical eye injuries serves to add to the value of this pamphlet.

The section entitled "A Well-Organized Eye Protection Program" presents a few of the fundamentals of the approach to protection. In this section two valuable tables are presented which indicate the type of protective equipment desirable in certain occupations and in certain chemical exposures.

For the specialist in the field of eye protection, as well as for the safety engineer in the chemical industries, the pamphlet fills a real need.

LEONARD GREENBURG

BOOKS RECEIVED

Listing in this column acknowledges the receipt of books and our appreciation to the senders. Space and the interests of readers will permit review of some, but not all, of the books listed.

ADVANCES IN PEDIATRICS. Vol. 4. Edited by S. Z. Levine, Allan M. Butler, L. Emmett Holt, Jr., and A. Ashley Weech. New York: Interscience, 1949. 316 pp. Price, $6.50.

AMERICAN FAMILY, THE.—A FACTUAL BACKGROUND. Report of the Inter-Agency Committee on Background Materials, National Conference on Family Life, May, 1948. Washington: U. S. Gov. Ptg. Office, 1947. 457 pp. Price, $1.25.

CHICAGO-COOK COUNTY HEALTH SURVEY, THE. Conducted by the U. S. Public Health Service. New York: Columbia University Press, 1949. 1267 pp. Price, $15.00.

CLINICAL DIAGNOSIS BY LABORATORY EXAMINATION. John A. Kolmer. New York: Appleton-Century, 1949. 1212 pp. Price, $12.00.

DENTAL CARIES. CLINICAL AND EXPERIMENTAL INVESTIGATIONS. T. Ockerse. Pretoria, So. Africa. Department of Health. 80 pp.

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

This Will Surprise You—". . . the hazard of death by accident has been greatly reduced. In the years 1946–1948, accidental deaths . . . at ages 1 to 74 years occurred at the rate of 43.4 per 100,000, or only a little over half the incidence of the period 1911–1915. . . ." There is still room for improvement.

ANON. Progress in Safety. *Stat. Bull.* (Met. Life Ins. Co.) 30, 9:1 (Sept.), 1949.

Quote—Dental health education no longer can be limited to the statement "see your dentist every six months." There are effective, economical ways to prevent and control dental disease. Only a well informed public can make the best use of them. Unquote.

BROWN, H. K. The Present Status of Dental Preventive Measures. *Canad. Pub. Health J.* 40, 9:382 (Sept.), 1949.

Science by Pronouncement—This item is as wide of the field of public health as any that has wandered into our fickle guide for the tractable. Here is the last sentence: "But for the grace of all who have fought for the freedom of the human mind, each of us stood in Moscow on August 7 last, and heard the words of doom: 'The Central Committee of the Party examined my report and approved it.'"

COOK, R. C. Lysenko's Marxist Genetics. *J. Hered.* 40, 7:169 (July), 1949.

Wholesale Health—How we love to roll new and high-sounding words over our tongues! Now it's "multiphasic" that is destined to become as overworked as "level" and "positive health." A multiphasic screening program will appeal to patient, health worker, and taxpayer. It will foster teamwork, reduce costs in money and misery. Few communities are so resourceless that they could not support a program once they appreciate its advantages. These are only a few of the pros.

CHAPMAN, A. L. The Concept of Multiphasic Screening. *Pub. Health Rep.* 64, 42: 1311 (Oct. 21), 1949.

Not To Be Missed—This is a badly needed paper but with—for me—not the happiest of titles, because I cannot restrain myself from adding, "and everybody's business is nobody's." People can be inveigled into taking a hand in community health promotion, the writer insists. Techniques for behind-the-scenes string-pulling, he sets forth in instructive detail.

DERRYBERRY, M. Health Is Everybody's Business. *Pub. Health Rep.* 64, 41:1293 (Oct. 14), 1949.

Pointed Remarks on Polio—If you could do with a little chastening, and chances are good you could, then read this paper which begins with critical comment on freehand researching and conclusion-jumping. Though the paper is concerned with polio, you may be able to read into it some warnings against easy assumptions in your own field. It is long and calls for concentration, but the results should be salutary.

HAMMON, W. McD. Immunity in Poliomyelitis. *Bact. Rev.* 13, 3:135 (Sept.), 1949.

On the Whole, Good—A pediatrician, practising outside London, gives a sympathetic picture of the first year's experience with the British National Health Service. Mostly we've heard from the G. P.'s. If you are interested in forming a rounded picture of the "biggest operation ever known in

medicine," you will want to add this item to your collection.

ILLINGWORTH, R. S. First Year of the British National Health Service. *Pediatrics* 4, 4:516 (Oct.), 1949.

Normal Phenomenon?—Like the music in the horn, pediatric ideas seem to go round and round. In this study of thumb-sucking it is recorded that babies who enjoyed that hideously insanitary, never-to-be-condoned, dummy teat did not become thumb-suckers. Sucking satiety is not the only factor in prevention but it is certainly one.

KLACKENBERG, G. Thumbsucking; Frequency and Etiology. *Pediatrics* 4, 4:418 (Oct.), 1949.

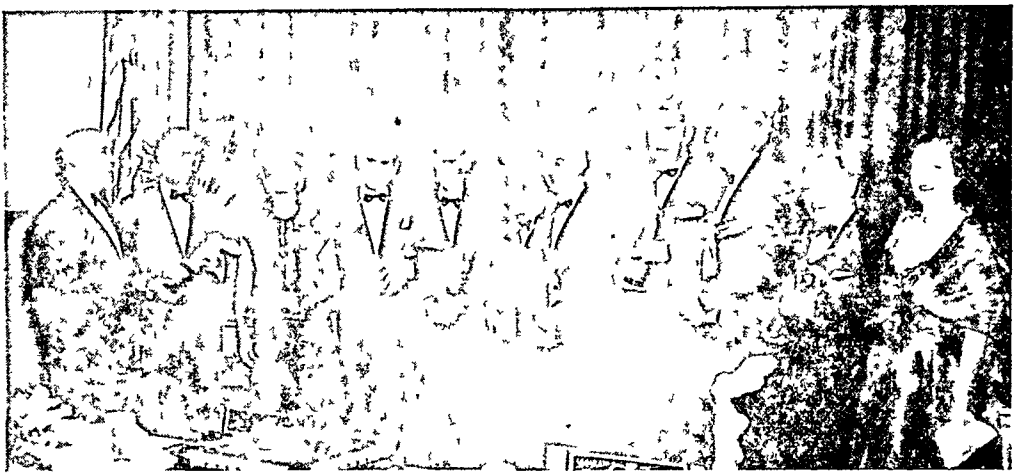
It Helps, But—It's asking the tail to wag the dog, he insists. Artificial vaccination (with BCG) probably does not produce results superior to natural vaccination, yet natural vaccination fails to control tuberculosis. It seems illogical to base a major attack against a disease on a skirmish against a minor phase of it. His advice is to stick to the big problem—unrecognized TB.

MEDLAR, E. M. Prophylactic (BCG) Vaccination to Control Tuberculosis. *J.A.M.A.* 141, 9:593 (Oct. 29), 1949.

Progress Report—Three universities are offering advanced courses in mental hygiene for public health nurses. The first graduates are at work as consultants in official and voluntary agencies.

PEASE, S. H. Public Health Nursing and Mental Hygiene. *Pub. Health Nurs.* 41, 10: 521 (Oct.), 1949.

Survey Pitfalls—Life is hard for the researcher in the field. He can gauge the people's health by diet surveys or by blood sampling, but he'll find precious little relationship between reported diet and blood values. Wide differences are found in the correlation between nutrient intake and plasma content. The mathematical procedures used to reach this discouraging conclusion were way over my head but they look convincing.



PUTNAM, P., *et al.* The Statistical Association Between the Diet Record and Ascorbic Acid Intake and the Blood Content of the Vitamin in Surveyed Populations. *Milbank Mem. Fund Quart.* 27, 4:355 (Oct.), 1949.

Getting Rid of Rats—Successful rat control programs are those that never stop. The toughest job is convincing the public that rat-infestation is a serious menace to health. A questionnaire was sent and this is to be the overall picture of what is being done. Part II will follow.

SNYDER, C. W. A Survey of Urban Rat Control in the U. S. A. *Modern San.* 1, 6:14 (Oct.), 1949.

NRC Committee Report—As brucellosis in human beings comes solely from infected domestic animals, public health has a stake in the difficult veterinary problem of control. Only the destruction of infected animals will do the job, and thus far that hasn't been practical. Aureomycin might do the trick but at present-day prices the cost is prohibitive.

SPINK, W. W., *et al.* Control and Eradication of Brucellosis in Animals. *J.A.M.A.* 141, 5:326 (Oct. 1), 1949.

THE LASKER AWARDS FOR 1949

The American Public Health Association for the fourth year, through the presentation of the Albert and Mary Lasker Foundation Awards, acknowledges outstanding contributions to scientific research related to diseases which are the most frequent causes of death and disability, and for distinguished services in the field of public health. The Awards both honor the recipients by dramatizing their accomplishments and seek to stimulate public and professional interest in any such work designed to provide a more healthful and happier lifespan for man.

The Lasker Awards for 1949 were conferred on October 25, 1949, at the First General Session of the 77th Annual Meeting in New York, N. Y. Eight individuals and two groups were honored:

DR HAVEN EMERSON of the American Public Health Association and The National Health Council—a *Special* Lasker Award—"for extraordinary achievement in developing a program for complete local health service in every area of the U S"

DR ANDRE COURNAND of Columbia University "for outstanding contributions to the physiology of the circulation in man and the diagnosis and treatment of heart disease"

MARION W SHEAHAN, R N, of the National Committee for the Improvement of Nursing Services "for distinguished leadership in the fields of nursing and public health"

DR MAX THEILER of The Rockefeller Foundation "for distinguished experimental work leading directly to the production of two effective vaccines against yellow fever"

DR. WILLIAM S TILLETT AND DR L R CHRISTENSEN of New York University jointly, "for discovery and purification of streptokinase and streptodornase and demonstration of their effectiveness in treatment of certain human diseases"

DRS. EDWARD C. KENDALL AND PHILIP S HENCH of the Mayo Clinic, jointly, "for their studies of adrenal hormones which culminated recently in the dramatic therapeutic effect of Cortisone in rheumatic disorders"

THE LASKER GROUP AWARD FOR 1949 HONORS

THE AMERICAN ACADEMY OF PEDIATRICS, DR WARREN R. SISSON, President, "in recognition of the public health significance of its notable nation-wide study on child health services and pediatric education"

THE LIFE INSURANCE MEDICAL RESEARCH FUND, M. ALBERT LINTON, Chairman, "for initiation and support of programs of research into the main cause of death, cardiovascular disease"

The beautifully illuminated citations read as follows:

DR. HAVEN EMERSON

Most recipients of high honors must accumulate the services of a lifetime in order to earn their reward. In Haven Emerson, however, we deal with a figure so unique that one episode alone out of a life of exceptionally distinguished service suffices to justify our appreciation.

During the last decade Dr. Emerson has demonstrated the power of an idea whose time has come. Although local health service under municipal government goes back at least 75 years, and though more than 40 years have passed since the founding of the first full-time rural health unit in the United States, there remains about one-third of our population and even larger part of our land area without even the rudiments of an organized health service.

Since 1942 Dr. Emerson in almost single-handed devotion has undertaken the task of solving this problem by overcoming public and professional complaisance with the status quo and thereby extending sound governmental programs for health to every part of the United States.

Studies directed by Dr. Emerson for the Committee on Administrative Practice have put on record for the first time the minimum basic services and the principles which should prevail in every community. The acceptance this report has received from organized medicine, from the various professions concerned, from voluntary health agencies and from Federal Government has been unprecedented.

A standard reference work, *Local Health Units for the Nation,* published in 1945, has become the pattern for public health planning in nearly every state. The influence and prestige of this movement are the more notable because the report has never had official status, yet cannot be ignored by any responsible health administrator today. The sheer perfection of the plan for the ends desired is the basis of its popularity and usefulness.

The record shows that Dr. Emerson, with the backing of the American Public Health Association and of the National Health Council, has planned notable conferences held for state health authorities at the University of Michigan and for national civic groups at Princeton which, in turn, led to the creation of a committee representing fifty national civic agencies which has brought overwhelming influence to bear. A series of conferences has been held, each representing several states, to broaden the base of citizen understanding and to facilitate the permissive legislation required.

To have made such an impress upon a public matter touching so intimately the health and well-being of every citizen would be a worthy achievement for any man's lifetime. Yet Dr. Emerson has undertaken this crusade and brought it far on the road to completion as one chapter in a long and distinguished life, full of honors and of achievement.

The Special Award is presented to Dr. Emerson in recognition of this part of his inspiring career because it promises to influence favorably the health and the lives of all Americans, and to provide the framework not only for the special services now recognized as essential to our civic health, but also for extensions into other fields which may open before us in the future.

DR. ANDRE COURNAND

To Andre Cournand a Lasker Award for 1949 is made for his original, constructive, and comprehensive research in the field of human pulmonary physiology, extending over a period of nearly twenty years; for his courageous application of the technique of catheterization of the heart to the study of cardiovascular blood pressures and blood flow; for his investigation, by these techniques, of the dynamics of circulatory failure in traumatic shock in man, and the effects of treatment in this condition; for his brilliant and profoundly significant contributions to the physiology of the pulmonary circulation, and of the dynamics of the heart in both normal and abnormal conditions, with clarification of the aims and effects of treatment; and finally, for the inspiration of his leadership as a scientist, counsellor, and teacher, to the rising generation of men and women engaged in research in the broad field of cardiovascular physiology and cardiovascular disease.

DR. WILLIAM S. TILLETT AND DR. L. R. CHRISTENSEN

In the course of certain diseases or following injury, an accumulation of pus or fibrin clots frequently occurs which may seriously delay or prevent healing. Up to the present, the treatment of such conditions has been by surgical evacuation, which often included major plastic operations for repair. Through the distinguished collaborative investigations of Dr. William S. Tillett and Dr. L. R. Christensen at New York University College of Medicine, "streptococcal enzymatic debridement" has been discovered and developed as a new therapeutic principle of important clinical sig-

nificance. In addition, our knowledge of the nature of a protein-digesting enzyme of human blood has been placed on a new basis and information gained on the composition of pus which changes previous concepts.

Dr. Tillett, an original and profound student of both the clinical and laboratory aspects of infectious disease, discovered in 1933 that hemolytic streptococci produce an enzyme, fibrinolysin, now known as streptokinase, a substance which dissolves human fibrin clots. Twelve years later, Dr. Christensen, a microbiologist, with a strong biochemical bent, demonstrated, after a characteristically penetrating and persistent investigation, that streptokinase functions by activation of another protein-digesting enzyme present in blood plasma, but usually in an inactive state. He also described a method of purifying streptokinase which permitted its successful use in patients.

In the course of clinical studies on the liquefaction of fibrinous and purulent exudates, it was recognized for the first time that the viscous character of pus is due in great part to desoxyribose nucleoprotein; moreover, it was found that the streptokinase preparations contained an enzyme, streptococcal desoxyribonuclease (streptodornase) which, through its digestive action on nucleoprotein, causes thick pus to become thin and watery and thereby facilitates its removal. Methods for purifying this enzyme have also been developed by these investigators.

This demonstration of the mode of action and clinical effectiveness of streptokinase and streptodornase is a brilliant contribution to the treatment of human diseases in which accumulated fibrin or pus impedes healing or delays it indefinitely. It is not an exaggeration to state that the principles involved in the clinical use of these streptococcal products stand out as a therapeutic landmark. In recognition of these important contributions to the advancement of medicine, the American Public Health Association presents a Lasker Award for 1949 jointly to Dr. William S. Tillett and Dr. L. R. Christensen.

MARION W. SHEAHAN, R.N.

The American Public Health Association pays tribute to a rare blend of talents in the person of Miss Marion W. Sheahan. Nursing service, the field of public health, and particularly public health nursing, have assumed a new and broader stature because of Miss Sheahan's inspiring leadership, skills and unswerving devotion to her "visions of a better world."

Her creative thinking helped to mold the plans which enabled nursing to play its proper role throughout World War II in health protection on the home front and mobilization of nursing personnel for the Armed Services.

Miss Sheahan was chairman of the National Nursing Planning Committee which formulated A Comprehensive Program for Nation-wide Action in the Field of Nursing. This became the blueprint which initiated and will guide progress in nursing for many years to come.

As Director of Public Health Nursing in New York State, she pioneered new methods that set the patterns for her own and many other States.

With ability and courage to reach difficult goals, Miss Sheahan has forged a record of superb achievement by her accomplishments.

DR. MAX THEILER

Dr. Max Theiler discovered in 1930 that white mice are susceptible to yellow fever virus inoculated intra-cerebrally and that serial intra-cerebral passage of the virus in this host produces a loss of virulence for monkeys.

This observation revealed for the first time the possibility of protecting exposed human beings against attacks of this dread disease. It led almost at once to a method of human vaccination against yellow fever which is still extensively used. Further work by Dr. Theiler, in 1936 and 1937, resulted in the production of a more profound modification of the virus by means of prolonged maintenance in tissue cultures. This strain of virus, known as 17D, has been made the basis of another effective vaccine utilized for the protection of millions of human beings against yellow fever in various parts of the world. Men and women in African and South American Jungles would be grateful to Dr. Theiler if they realized their debt to him.

The American Public Health Association belatedly recognizes this debt with deep appreciation by a Lasker Award to Dr. Theiler for these outstanding scientific contributions to human health and welfare.

DR. EDWARD C. KENDALL AND DR. PHILIP HENCH

After isolating thyroxine from the thyroid gland in 1914 and glutathione from yeast in 1939, Dr. Kendall turned his attention to the chemistry of the hormones of the adrenal glands. Since 1932, Dr. Kendall has achieved a rare measure of success in the isolation of active steroids from the adrenal cortex, including Compounds A, E, and F. The chemical isolation of these substances made it possible for Dr. Kendall and his collaborators, as well as investigators throughout the world, to study their physiological action. Dr. Kendall's

chemical studies have also aided immeasurably in the recent large-scale synthesis of Compounds A and E.

Dr. Philip Hench, a physician with a long and deep interest in rheumatic disorders, had on clinical grounds come to believe that an inadequate supply of certain adrenal steroids might constitute a fundamental disturbance in rheumatoid arthritis and allied disorders. In closest association with Dr. Kendall, Dr. Hench systematically tested the effects of various adrenal hormones as they became available for clinical trial. These studies culminated in the demonstration of the almost miraculous therapeutic effect of Compound E, now termed Cortisone, in the management of rheumatic disorders.

For these valuable contributions to human biology and the therapy of one of the commonest diseases of mankind, the American Public Health Association presents a Lasker Award for outstanding scientific achievement to these distinguished investigators.

THE LIFE INSURANCE MEDICAL RESEARCH FUND, M. ALBERT LINTON, CHAIRMAN

The Life Insurance Medical Research Fund was established in 1945 by the cooperative participation of most of the important life insurance companies of the United States and Canada for the purpose of making grants in support of medical research, the results of which might be expected to reduce mortality and improve longevity. Under the able chairmanship of M. Albert Linton, the Fund initiated a program of aiding research on cardiovascular disease at a time when financial support for research in this field was very limited.

From its inception the Fund, in recognition of the well-established principle that research in the basic medical sciences often and sometimes unexpectedly provides the knowledge essential for the development of methods for the prevention or cure of disease, wisely adopted the policy of placing major emphasis on support of fundamental research.

It is already apparent that the activities of the Fund not only have served to focus attention on the need for cardiovascular research but also through its grants and fellowship program have given a great impetus to research in both the experimental and clinical fields.

Of perhaps even greater importance than its direct financial contributions to the solution of problems of cardiovascular disease, the Fund has set a pattern for the cooperative support of medical research by private agencies which possess fundamental social significance for the public health and may well serve as an example for the establishment of similar undertakings by other private and quasi-public agencies. In recognition of these constructive contributions to the advancement of medical science and public health, the American Public Health Association presents a group award for 1949 to the Life Insurance Medical Research Fund for outstanding public service.

THE AMERICAN ACADEMY OF PEDIATRICS, DR. WARREN SISSON, PRESIDENT

The American Academy of Pediatrics has concerned itself for more than eighteen years with securing better and more evenly distributed health services for the children of this country.

In line with its purpose to make medical care of high quality available to all mothers and children, regardless of race, creed, or economic circumstances, this distinguished national body of pediatricians initiated a comprehensive nation-wide study of child health services and of pediatric education in 1945 with the active participation and support of the United States Children's Bureau and the Public Health Service.

The study covered every state and county in the Nation during the course of three years. Its detailed findings, recently published by the Commonwealth Fund under the title, "Child Health Services and Pediatric Education," clearly reveal the inadequacies of professional personnel and facilities peculiar to each state, which are dependent upon the nature of its population, its geography, and its economic status. These revelations also point the way to methods for early correction of the deficiencies, if the people of our country and the legislators can be made to realize their full significance.

In appreciation of this outstanding service to the mothers and children of our country, the American Public Health Association has selected the American Academy of Pediatrics as the recipient of its 1949 Lasker Group Award for meritorious achievement in the field of public health.

The Association is particularly gratified that an Award this year goes to a national medical society composed of physicians engaged in clinical pediatrics and in pediatric education and research.

By its great accomplishment, the American Academy of Pediatrics has emphasized the dedication of the pediatricians of this country to unselfish public service. At the same time it has demonstrated that a national medical society motivated by these ideals can work in close association with our federal agencies in a spirit of mutual confidence and helpful collaboration.

ASSOCIATION NEWS

OFFICERS, 1949–1950

President—Lowell J Reed, Ph D, Baltimore Md
President-Elect—William P Shepard, M D, San Francisco, Calif
Vice-Presidents—
Marcolino G Candau, M D, Rio de Janeiro, Brazil
Mary P Connolly, M S, Ann Arbor, Mich
Adelard Groulx, M D, Montreal, Quebec
Treasurer—Herman E Hilleboe, M D, Albany N Y
Executive Secretary—Reginald M Atwater M D New York N Y
Chairman of Executive Board—Hugh R Leavell, M D Boston, Mass
New Members of Executive Board—
Hugh R. Leavell, M D, Boston, Mass
Charles G King, Ph D, New York, N Y

Lowell J. Reed, Ph D., President of the American Public Health Association

Lowell J. Reed, Ph.D., of Baltimore, Md., Vice-President of Johns Hopkins University and Hospital, assumed the Presidency of the Association at the close of the 77th Annual Meeting in New York City on October 28, having served as President-Elect since 1948

Dr Reed, who is a native of New Hampshire, was graduated from the University of Maine in 1907, and received a Master of Science degree from the same institution in 1912 and the Ph.D. degree from the University of Pennsylvania in 1915.

Dr. Reed's academic positions have been continuous since 1907, with instructorships at the University of Maine, the University of Pennsylvania, and a period of service as Assistant Professor at the University of Maine. During World War I he served as Director of the Bureau of Tabulation and Statistics for the War Trade Board.

With the establishment of the School of Hygiene and Public Health at Johns Hopkins University, Baltimore, Dr. Reed in 1918 became Associate Professor of Biometry and Vital Statistics, which post he continued until 1925. In that year he was made Professor and he has served as Dean and Director of the School, 1937–1946, and as Vice-President of the University in charge of medical affairs during the most recent

Lowell J Reed, Ph D

three year period. His new position as Vice-President of the Johns Hopkins University and Hospital was only recently announced in connection with a reorganization of the medical units at the Hopkins.

Dr. Reed joined the American Public Health Association in 1925 and was elected a Fellow of the Vital Statistics Section in 1928. He has been actively identified with the American Statistical Association, the American Association for the Advancement of Science, the American Mathematics Society, the Mathematics Association of America, the International Union for Scientific Investigation of Population Problems, and the Population Association of America. Dr. Reed is an Associate Fellow of the American Medical Association For many years he has served as a member of the Technical Board of the Milbank Memorial Fund, New York, and of the Board of Scientific Directors of the Rockefeller Foundation, New York. He is a member of Phi Beta Kappa, Sigma Xi, Delta Omega, and Phi Kappa Sigma.

In addition to his work as a teacher. Dr Reed has made many contributions to scientific literature and is particularly well known as consultant on medical and public health education. He recently served as a special Congressional referee in connection with the development of a bill for federal aid to medical, public health, engineering, dental, and nursing education.

SEDGWICK MEMORIAL MEDAL TO DR. VAUGHAN FOR 1949

THE Sedgwick Memorial Medal was presented on behalf of the Association on October 27, 1949, by Abel Wolman, Dr.Eng., of Johns Hopkins University, Baltimore, Chairman of the Sedgwick Memorial Committee, to Henry F. Vaughan, Dr.P.H. In his presentation. Dr. Wolman gave the following citation:

"The American Public Health Association delights to honor Dr. Henry F. Vaughan with the bestowal of the Sedgwick Memorial Medal for distinguished service in public health.

"This award to Dr. Vaughan represents the nineteenth time this Medal has been presented since 1929. The names of those honored in the last two decades reflect the variety of achievement which has been recognized as meriting such high distinction in public health. There have been public administrators like Chapin, Haven Emerson, and Thomas Parran; research scientists like Theobald Smith, George W. McCoy, William H. Park, Milton J. Rosenau, Hans Zinsser, and Karl F Meyer. There have been great teachers like Frost and Winslow, and distinguished servants of the common good in related fields.

"Henry Vaughan's record is a constellation of brilliant achievements. Best known to an earlier generation as the Health Officer of Detroit for almost twenty-five years, Dr. Vaughan built

HENRY F. VAUGHAN, DR P H

there a Department of Health of world-wide fame, noted for its aggressive and imaginative approach to the really important aspects of health, as well as for the teamwork of his specially able staff associates. His record in Detroit was marked in particular by his productive relationships with physicians. Here a pattern was set which has influenced scores of other health departments across the land and overseas.

"Since 1941 Dr. Vaughan has been Dean of the School of Public Health at the University of Michigan. In this capacity his creative talents have continued to assert themselves. He has assembled an excellent faculty and has offered a course closely related to the practical aspects of modern public health. Beyond the classroom work Dr. Vaughan has developed a unique series of institutes to which have come hundreds of practising health workers for truly refreshing experience. The organization of these conferences has utilized the best features of group dynamic technics and has set standards for graduate education that place Michigan among the forefront of universities linked with practical programs.

"Dr. Vaughan, who was never a man to be fenced in with accepted conventions, has organized the National Sanitation Foundation which represents cooperation between a university and the leading industries concerned with products on which the maintenance of the public health depends. He has been a leading influence in the developing program of the W. K. Kellogg Foundation. His service to Detroit has been rounded out with sustained help to the State of Michigan as a member of the Public Health Council.

"The American Public Health Association has had an opportunity at first hand to enjoy the statesmanlike leadership of Dr. Vaughan, and in making this award there is a sense of special pride in this public recognition of his achievements long known to the officers and boards of this professional society.

"Dr. Vaughan became a member of the American Public Health Association in 1914 and was elected a Charter Fellow in 1922. He became a Life Member in 1929. He was Vice-President of the Association in 1923 and President in 1925. He has served six terms as an Elective Member of the Governing Council, beginning in 1916. He has been a member of the Executive Board of the Association during nine years. He was Editor of the *American Journal of Public Health,* 1922–1924. He served as Vice-Chairman of the Health Officers Section in 1921 and for nine years was a member of the Council of the Section and for two years Chairman of the Association Committee on Fellowship and Membership. He was for nine years Chairman of the Committee on Constitution and By-Laws. For many years since 1924 he has been a member of the Committee on Administrative Practice, of which he served as Chairman in 1942 and 1943. He is now a Consultant of the Committee.

"In many respects Dr. Vaughan's career has represented the flowering of an idea which guided William T. Sedgwick in training young men to be health administrators. Sedgwick believed that sound grounding in the pre-clinical sciences was essential, but that the possession of an M.D. degree was not obligatory for health officers. For almost twenty-five years in Detroit Dr. Vaughan demonstrated how well a department might be operated with competent medically trained persons in various bureau positions under a commissioner of health whose background was engineering and sanitation.

"Dr. Vaughan is a native of Ann Arbor where he now lives, the son of Dr. Victor C. Vaughan and Dora Taylor Vaughan. He received his baccalaureate degree from the University of Michigan in 1912, followed by a Master of Science

in 1913 and the Doctorate in Public Health in 1916. Dr. Vaughan practised sanitary engineering and public health, 1913–1917 and was an Associate Professor of Public Health at Wayne University, Detroit, 1915–1937, following which he was Professor, 1937–1941. He was Commissioner of Health of the City of Detroit, 1918–1941 and has been identified with public health teaching at the University of Michigan since 1922. Since 1941 he has been Professor of Public Health and Dean of the School of Public Health at Ann Arbor.

"Dr. Vaughan, the American Public Health Association honors itself in awarding to you this Medal commemorating the services of William Thompson Sedgwick as a symbol of our recognition of your own distinguished achievement in public health."

Dr. Vaughan, in accepting the Award, made the following response:

"In accepting this priceless award I am not unmindful of the great honor which has been conferred upon me, and through this means upon my associates of the past many years. I feel extremely humble in accepting even momentarily the enduring symbol which keeps alive the spirit of William T. Sedgwick. This beloved teacher, recognized for such distinctive contributions to the progress of human biology and the training of men of science, possessed unusual power for discerning professional relationships. We are only now gradually cementing the various disciplines of the health specialties into a modern pattern and basic structure which represents the fulfillment of his ideals so aptly expressed nearly half a century ago.

"Professor Sedgwick joined our Association in 1902 and, at the Annual Meeting held at New Orleans that same year, as Chairman of the Committee on the Teaching of Hygiene, he emphasized the need of including as members of the health department staff full-time physicians trained and steeped in the science and experience of public health practice, and he also stressed the part that the bacteriologist and sanitary engineer should play in performing necessary investigations into the field of environmental health, serving as advisers and coworkers to the medical officer.

"Three years later at our thirty-third annual meeting held in Boston, in discussing the readjustment of education and research in hygiene and sanitation, he emphasized as a fundamental need the establishment of permanent, well paid positions in the health services. He declared as his belief that we should never cease for an instant to proclaim the necessity for well trained career personnel to man the health agencies. Then, typifying his staunch belief that public health would succeed only in the hands of men and women unshackled from the heritage of political tradition and domination, he prophesied the currently accepted practices in preparing individuals in sanitary biology, sanitation, epidemiology, and public health statistics and then qualified these suggestions with the statement that the health director must be a man who possesses tact, courage, and firmness.

"Thus today on the eve of noteworthy expansion in our training programs with the aid of our federal, state, and local health departments in providing funds for personnel training and encouragement for young men and women about to enter public health career work, we begin to see a realization of the prophetic delineation so forcibly outlined by Sedgwick many years ago. And again with the fulfillment of a plan to extend and strengthen effectively local health services throughout America, we are about to witness the accomplishment of proposals made by this beloved educator and public health statesman in 1905.

"And so we pause each year in the midst of our scientific and educational

conferences at the Annual Meeting of the American Public Health Association to pay honor to William T. Sedgwick as a man of far-reaching discernment and to take stock among ourselves as to the progress we are making in the fulfillment of the ideology of one who labored efficiently and effectively in promoting and conserving human health and welfare. The human race will always be the richer for his power of visualizing the health problems of his day and of the future. Untold millions will benefit by his contributions and those of his disciples to the progress of education and to the establishment and maintenance of adequate full-time community health services."

ACTIVITIES OF THE VOCATIONAL COUNSELING AND PLACEMENT SERVICE

The Association's Vocational Counseling and Placement Service, under the direction of Dr. F. W. Racker, again operated a booth among the scientific exhibits at the A.P.H.A. Annual Meeting in New York City. As in previous years there was considerable interest in the services offered on the part of employers, candidates, and of newcomers who wished to obtain information on public health careers. The Nurse Counseling and Placement Office of the New York State Employment Service occupied the adjoining booth. This was an expedient arrangement since the Vocational Counseling and Placement Service does not undertake to register nurses, believing that this function is best handled by specialized agencies such as the Nurse Counseling and Placement Office.

At the 76th Annual meeting in Boston, 75 employers and 33 candidates for positions were interviewed (excluding nurses). In the same occupational groups the ratio of employers to candidates was practically reversed this year with 37 employers and 69 candidates interviewed. The increase in candidates was most striking in the health education, sanitarian, and laboratory groups.

Year-to-year changes in the register of the Vocational Counseling and Placement Service permit some conclusions on the changing supply and demand in the various occupational groups. In September, 1949, a letter was sent to all employers on the active register inquiring which of the openings registered during the past year, and not reported as filled, still remained open. A crude analysis of the replies revealed the following interesting results: only 18 per cent of the medical openings had been filled as against 51 per cent of the engineering, 42 per cent of the sanitarian, 57 per cent of the laboratory and 60 per cent of the health education openings. These figures indicate that the personnel shortage is most striking in the medical group of positions, openings in the other job categories being filled with less difficulty (not taking into account the nursing group). Recent discussions with a number of public health employers confirmed the impression that it has become easier than in the past few years to fill the lower grades of laboratory, engineering, and sanitarian openings but that it is still very difficult to find suitable candidates for medical openings and for some of the higher grades of openings in other professional groups.

The candidates on the register also had received follow-up letters prior to the Annual Meeting. Their replies revealed that only 10 per cent are unemployed while the remaining 90 per cent are currently employed but are interested in better opportunities. The ratio of openings to candidates on the register over the past four years has been rather consistently 4:1 (10 to 1 for the medical group).

These findings clearly point to the need for active recruitment of new workers into the public health field, especially to those professional groups in which the greatest shortage of trained personnel exists.

NEW PROJECTS, OFFICERS AND STAFF FOR THE COMMITTEE ON CHILD HEALTH

The Association Committee on Child Health was established in 1947 while Dr. Martha Eliot was President of the Association (see *A.J.P.H.*, Feb., 1948, p. 295). Dr. Leona Baumgartner, the Committee's first Chairman, resigned last summer when she was appointed Associate Chief of the Children's Bureau. Dr. Samuel M Wishik, Director, Bureau of Child Health, New York City Department of Health, succeeded Dr. Baumgartner as chairman of the committee. Dr. Franziska W. Racker of the Association staff has immediate administrative responsibility for the activities of the committee in the central office in close coöperation with the chairman and under the direction of the Executive Secretary.

One of the contributions which this committee has already been able to make has been the establishment of a successful liaison on problems of mutual concern with the Committee for the Improvement of Child Health of the American Academy of Pediatrics (see *A.J.P.H.*, Aug. 1949, p. 1078). One area of particular interest to both groups is the training of physicians in well child supervision.

The committee's major project and interest at the present time is to collect, review, and classify standards and recommended practices in public health programs in the field of child health, and to make these "codified standards" available to workers in the field.

With the financial aid of the New York Fund for Children, staff time for administrative and research activities has been made available for this project. On September 1, 1949, Dr. Barbara M. Korsch was appointed Research Associate of the Committee on Child Health. Dr. Korsch is a pediatrician who is at present dividing her time between the Committee on Child Health and the New York City Department of Health. She received her medical degree at Johns Hopkins Medical School in 1944, served a rotating internship and assistant residencies in pediatrics and medicine in New York City and Cooperstown, N. Y. She is particularly well trained in the field of growth and development and emotional problems of children, having been a Public Health Service Research Fellow at the Institute of Child Development of New York Hospital and a Pediatric Consultant at the Menninger Clinic at Topeka Kan.

BARBARA M. KORSCH, M D

JOURNALS WANTED

The Association will appreciate it if members who can spare copies of the March, April, June, and October, 1949, issues of the *Journal*, will send them collect, addressed as follows: Circulation Department, American Public Health Association, 1790 Broadway, New York 19.

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

John T. Gentry, M.D., 412 Rogers Bldg., Glen Falls, N. Y., Apprentice Epidemiologist, New York State Dept. of Health

Eleanor B. Gutman, M.D., Coos County Health Dept., Coquille, Ore., County Health Officer

Lt. Col. John R. Hall, Jr., M.C., Armed Forces Staff College, Norfolk 11, Va., Medical Officer, United States Army

Comdr. Matthew J. Hantover, M.C., U. S. Naval Air Station, c/o BOQ, Alameda, Calif., United States Navy, Commander

Jacob Hurowitz, M.D., 100 Post Ave., New York 34, N. Y., Physician-in-charge, Washington Heights Social Hygiene Clinic, New York City Dept. of Health

Henry W. Kassel, M.D., Window Rock, Ariz., Chief Medical Officer, Navajo Service, P.H.S., F.S.A.

William J. Kennard, M.D., 1312 24th St., South, Arlington, Va., Chief, Aviation Medical Division, Office of the Surgeon General, U. S. Air Force

Pao-Zan King, M.D., M.P.H., 405 E. 42nd St., New York 17, N. Y., Medical Advisor, United Nations International Children's Emergency Fund

Alphege Landreville, Health Dept., New Bedford, Mass., Agent

George R. Landy, M.D., Sanilac County Dept. of Health, Sandusky, Mich., Medical Director

William A. Loori, M.D., 549 Pavonia Ave., Jersey City, N. J., Attending Physician, St. Joseph's School for the Blind

Harold J. Magnuson, M.D., M.P.H., Box 687, Chapel Hill, N. C., Senior Surgeon, Syphilis Experimental Laboratory, F.S.A., P.H.S.

I. J. Markel, M.D., 215 W. Franklin St., Elkhart, Ind., Health Commissioner, City of Elkhart

FLORIDA PUBLIC HEALTH ASSOCIATION

Delegates, approximately 500 of them, to the 21st annual convention of the Florida Public Health Association held October 6 to 8 in West Palm Beach agree that it was the most successful one ever held.

Not only did the convention break attendance records, but it marked the first time that a woman, Ruth E. Mettinger, was seated as president of F.P.H.A. Miss Mettinger is director of nursing for the State Board of Health, a position she has held since 1934.

Named to serve on the slate with her were: Robert G. Carter, State Improvement Commission, first vice president; Mrs. Malcolm Smith, director, Florida Cancer Society, second vice president. Returned to office were Fred Ragland, finance officer and Miss Elsie Hyatt, also of the State Board of Health, as secretary and treasurer, respectively.

The Association went on record as urging "continued active opposition to any move for the consolidation of health and welfare administration in this country."

MINNESOTA PUBLIC HEALTH CONFERENCE

The new officers of the Minnesota Public Health Conference elected at the Third Annual Meeting held in Minneapolis on September 30 are:

President: F. W. Behmler, M.D., Morris

1st Vice-President: V. O. Wilson, M.D., Rochester

2nd Vice-President: E. A. Meyerding, M.D., St. Paul

Treasurer: C. G. Sheppard, M.D., Hutchinson

Executive Secretary: Dean S. Fleming, M.D., Minneapolis

Herbert Bosch was elected to represent the Conference on the Governing Council of the A.P.H.A.

A.P.H.A. membership application blank on page XXVII

EMPLOYMENT SERVICE

The following pages present information for those seeking qualified public health personnel and for those seeking positions in public health.

This is a service of the Association conducted without expense to the employer or employee.

(e) To conduct health education program in tuberculosis control among Negro population; county health department, Middle West. (f) To direct generalized public health program; college town of 80,000, metropolitan area of East. (g) Field nurses, county health department, Southern California; salaries dependent upon experience. (h) Public health coördinator; fairly large hospital; Hawaii. (i) School nurse to direct health program, resort town, 15,000, Pacific Northwest. (j) Student health nurse, young women's college; living accommodations on campus; will have privilege of all campus facilities; East. (k) Executive secretary; state nurses' association; public health nursing experience desirable; considerable traveling. (l) Staff nurse; newly organized service, generalized program; Chicago area. PH12-4 Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Opportunities Wanted

Dentist, qualified public health and children's dentistry; B.A., D.D.S., M.A., Ph.D., leading schools; year's residency, children's dentistry; teaching experience; research has been particularly concerned with administrative and educational problems in connection with children's dental programs in underdeveloped areas; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Health educator; Master's degree, Public Health, Eastern university; four years, health educator, county health department; three years, health coördinator, liberal arts college; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Public health nurse administrator; B.S. (Education); MPH; four years, consultant in public health and school nursing, metropolitan health department; past several years, director, health education program, county health department; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Physician distinguished in field of public health medicine is available; M.S., M.D., D.P.H. degrees, leading schools; enviable career of successful experience in academic and administrative public health work; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Sanitary Engineer, B.S. (Civil Engineering); year's graduate training, Harvard Graduate School of Engineering; twelve years' experience; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

Statistician; M.S., Ph.D. degrees; five years' teaching experience; past several years, director vital statistics, division city health department; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago.

NEWS FROM THE FIELD

INTER-ASSOCIATION COMMITTEE ON HEALTH

Six large national professional associations concerned with the nation's health have formed an Inter-Association Committee on Health to study and discuss methods of improving health care for the nation. The third meeting was held November 12 at the Hotel Statler, New York City, at which time the following announcement was authorized:

Participating associations are: The American Dental Association, American Hospital Association, American Medical Association, American Nurses Association, American Public Health Association, and American Public Welfare Association.

The committee will serve as a means for the exchange of information on the programs of the participating organizations to the end that a common understanding may be reached toward the solution of national health problems. The committee will carry on activities contributing to the major objectives of improving the health of the nation. The committee adopted principles of organization which are to be recommended for approval to the appointing organizations each of which is represented by three members.

Representing the American Dental Association were Dr. Philip E. Adams, President, Boston; Dr. William McGill Burns, Trustee, Brooklyn; Dr. Kenneth A. Easlick, Ann Arbor; Dr. Harold Hillenbrand, Secretary, Chicago.

Representing the American Hospital Association were: John N. Hatfield, President, Philadelphia; John H. Hayes, New York City; Dr. Charles F. Wilinsky, President-elect, Boston; George Bugbee, Executive Director, Chicago.

Representing the American Medical Association were Dr. Louis H. Bauer, Chairman, Board of Trustees, New York; Dr. E. S. Hamilton, Kankakee, Ill.; Dr. E. L. Henderson, President-elect, Louisville, Ky.; Dr. James R. Miller, Trustee, Hartford, Conn.; Dr. George F. Lull, General Manager, Chicago.

Representing the American Nurses Association were Agnes Gelinas, New York; Ruth W. Hubbard, Philadelphia; Elizabeth K. Porter, Cleveland; Ella Best, Executive Secretary, New York.

Representing the American Public Health Association were Dr. Hugh R. Leavell, Chairman, Executive Board, Boston; Dr. Lowell J. Reed, President, Baltimore; Dr. Dean A. Clark, Chairman A.P.H.A. Sub-committee on Medical Care, Boston; Dr. Reginald M. Atwater, Executive Secretary, New York.

Representing the American Public Welfare Association were Loula Dunn, Director, Chicago; Raymond M. Hilliard, Member, Board of Directors, New York; James Brindle, Chairman, Committee on Medical Care; Dr. Ellen C. Potter, Trenton, N. J.; Elizabeth Wickenden, Washington.

STATE HEALTH OFFICERS MEET

The 48th Annual Surgeon General's Conference with the State and Territorial Health Officers was held in Washington, October 18–22. The following officers were elected.

President: Wilton L. Halverson, M.D., California

Vice President: Roy L. Cleere, M.D., Colorado

Secretary-Treasurer: Leroy E. Burney, M.D., Indiana

Executive Committee: Floyd C. Beelman, M.D., Kansas; Newman H. Dyer, M.D., West Virginia; Vlado A. Getting, M.D., Massachusetts

In addressing the meeting, Oscar R. Ewing, Federal Security Administrator, expressed the opinion that the 81st Congress had displayed more interest in health measures than any Congress in history. He cited the following Congressional actions in support of this position:

1. A doubling of the annual hospital construction authorization (including health centers) to a total of $150,000,000 in federal funds and a provision for $1,200,000 for research into hospital service systems.

2. Passage by the Senate of the bill in aid of training for professional personnel, together with a favorable report from the House Committee.

3. Favorable action by the Senate on the bill for support of grants to states for local health services and approval by House Subcommittee.

4. Senate action on the school health services bill with no action in the House.

5. Legislation aimed to extend research activities of the Public Health Service, including two new research institutes, one on neurological diseases and blindness and the other on rheumatism and arthritis, supported by the Senate.

Mr. Ewing called attention to the fact that there was no affirmative action on a series of bills to extend health services for children by increasing federal grants for maternal and child health from $11,000,000 to $25,000,000 annually, and crippled children's services from $7,500,000 to $25,000,000. Nor was action taken on the proposal to add $10,000,000 to the field of child research.

In speaking to the group, Surgeon General Leonard A. Scheele recalled that in 1903 the total expenditure of the Public Health Service was $1,274,000, whereas during the current year it will be $353,499,000, including hospital construction. Dr. Scheele announced that a small unit of officers has been trained in coöperation with the Atomic Energy Commission to give advice on the control of health hazards arising from radiation-producing equipment and radioactive materials. He pointed to the need of more research in air pollution by industrial chemicals as a result of the Donora, Pa., "smog" study.

A number of resolutions were adopted by the Conference as follows:

1. Urging Congress to establish a Department of Health headed by a career physician of the U. S. Public Health Service.
2. Recommending federal grants in aid available for the establishment or strengthening of schools of public health.
3. Condemning the Truman-Ewing plan for compulsory health insurance.
4. Requesting another communicable disease conference in 1950 similar to the one conducted in Atlanta just before the current Surgeon General's Conference.
5. Approval of showing in schools and churches the films "Human Growth" and "Human Reproduction."
6. Recommending that the Service and the Children's Bureau jointly provide government support for a recruitment program proposed by the American Public Health Association. This resolution in full reads:

WHEREAS, the implementation and success of each and every public health program depends upon the availability of adequately trained and experienced personnel, and

WHEREAS, there are many vacancies in Federal, State and local health agencies, and

WHEREAS, health agencies are not able to procure the needed personnel, therefore be it

RESOLVED that the Association of State and Territorial Health Officers urge the Public Health Service and the Children's Bureau to determine forthwith the method whereby the American Public Health Association can be financially assisted by the Federal agencies concerned in their "Personnel Procurement Program," and be it further

RESOLVED that the States and Territories hereby agree to finance this project by assessment against their Federal grants-in-aid for these services, and that the Executive Committee of the Association of State and Territorial Health Officers be directed to develop with the Public Health Service and Children's Bureau a method for paying from the grants-in-aid on an agreement for service rendered basis payment directly from the Public Health Service and the Children's Bureau, Federal Security Agency.

HILL-BURTON ACT LIBERALIZED

An amendment to the Hill-Burton Hospital Construction Act, passed by the first session of the 81st Congress, increased federal grants to states for construction of hospitals and health centers from 75 to 150 million dollars annually. A new formula permits federal contribution up to two-thirds of the cost of construction of new hospitals as against a one-third ceiling of the original law, with a formula that can be weighted in favor of lower income communities. It also extends the period during which allotments may be made from June 30, 1950, to June 30, 1955. It further provides $1,200,000 annually for 5 years for a research program looking toward coördination and improvement of hospital services.

The construction program of the Hill-Burton Act is administered by the Public Health Service under direction of its Surgeon General, Leonard A. Scheele. As of October 1, 1949, 50 hospitals had been completed and were in operation, 400 were under construction, and a total of 954 projects approved. The majority

of those already completed are small general hospitals located in small towns or rural areas. An integral part of the construction program is the coördination of such small hospitals into a regional system with a fully equipped teaching and medical center at its apex. Four such regional projects are now in operation centered respectively in the Medical College of Virginia, the New England Medical Center, the Council of Rochester (N. Y.) Regional Hospitals, and University of Michigan Medical School.

CARE BOOK PROGRAM FOR PUBLIC HEALTH RECONSTRUCTION

The Cooperative for American Remittances to Europe, Inc. (CARE), a nonprofit corporation, proposes to Americans a channel through which they can provide new text and reference books in public health and other scientific fields to libraries, universities and technical schools in war depleted countries. The need for such gifts grows out of the widespread destruction of books through book burning and bombing. Throughout the war years and since no new books have come into a full half of the world. The many problems of reconstruction, combined with printing difficulties and lack of dollars, have continued to make it impossible for foreign countries to replenish their libraries with reference and text books on the scientific and technical advances made during and since the war.

Contributions for the Book Program in any amount are accepted at CARE headquarters, 20 Broad Street, New York, or in any local CARE office throughout the country.

RURAL DOCTORS FOR OHIO

The Ohio State Medical Association has established a Rural Medical Scholarship plan "to stimulate interest on the part of rural young men and women in the study of medicine, with the belief that, because of their interest in rural life, they will later establish medical practices in rural communities."

The plan is limited to residents of smaller Ohio communities. It provides annual grants of $500 to successful candidates for a period of four years, providing the candidate does acceptable academic work. One new scholarship will be awarded annually and the recipient may enroll at any approved medical school in the country.

UTAH HAS HEALTH AUDIT

The State of Utah recently sought the services of Dr. Ira V. Hiscock, New Haven, Conn., chairman of the Subcommittee on State and Local Health Administration of the A.P.H.A. Committee on Administrative Practice as a consultant. In a short but productive visit Dr. Hiscock helped the state officials and citizens define their problems clearly and establish a practical plan for early definitive action.

The Ogden (Utah) *Standard-Examiner* described the event as follows:

"Yale University's Dr. Ira V. Hiscock wrote a report about Utah's public health department that hurts. It hurts so much that like a diseased tooth something will be done about it.

"The report hurt when Dr. Hiscock said that Utahans die unnecessarily from diphtheria, intestinal and respiratory diseases and tuberculosis.

"It hurts to read that we have problems of environmental sanitation, which means that a lot of places are filthy when they should be clean and sweet.

"And it hurts when he says we do not have a reasonably adequate public health program because the state has been too cheap to pay fair salaries.

"Dr. Hiscock knows how to get under our skin in Utah where we pride ourselves on our progress in education. He wrote: 'An educated child in the graveyard is of little value to the community or the state.'

"He said a lot in a paragraph of his report as follows:

"'This is no time for complacency, vested interests, red tape or petty bickering over administrative details. Without proper steps to assure a reasonably adequate, although minimum, health program now, and such steps toward constructive long-range plans and coöperative action, the time, money, and energy devoted to agriculture, education, pub-

lic works, welfare and other governmental enterprises will not be used to the best advantage for the people of Utah.'

"We can stop the 'bickering over administrative details' by improving the state health department plan of organization so that the State Board of Health becomes solely a policy making body whose policies are carried out by the State Health Commissioner.

"Governor Lee promises action to build up the department. That is splendid. We should move quickly to carry out Dr. Hiscock's recommendation, so we don't lose any more of the good men and women in the department."

FIRST CARDIOVASCULAR MEETING

What is said to be the first national meeting of its kind, a National Conference on Cardiovascular Diseases, will be held in Washington, D. C., January 18–20, 1950. Called jointly by the American Heart Association and the National Heart Institute of the Public Health Service, the Conference will be staffed by the two agencies with John W. Ferree, M.D., Director of Public Health, American Heart Association, serving as conference director. The invited participants will represent public health, nursing, social work, hospital administration and rehabilitation, as well as the medical disciplines.

H. M. Marvin, M.D., president of the Heart Association and C. J. Van Slyke, M.D., director of the Heart Institute, in calling the Conference said "The time is ripe for the forces of research, community service, and education to close ranks in the fight against diseases of the heart and circulation. This conference, we hope, will provide the guideposts for a comprehensive and concrete program of action to correlate an all-out national attack on the heart disease problem."

COMMUNICABLE DISEASE CENTER CONFERENCE FOR STATE HEALTH OFFICERS

The state and territorial health officers of the United States were guests of the Communicable Disease Center, U. S. Public Health Service, in Atlanta, Ga., October 17 and 18 for a conference at the Fulton County Academy of Medicine.

State health officers were welcomed by Surgeon General Leonard A. Scheele on behalf of the Service, and a series of ten panels were presented by the staff of the Communicable Disease Center in coöperation with selected state health departments. The subjects of the panels included the general considerations of communicable disease control, morbidity reporting, tuberculosis, the virus diseases, amebiasis, diphtheria, rabies, brucellosis, salmonellosis, and streptococcal infections.

Opportunities were given those present to see the facilities of the Communicable Disease Center in Atlanta and at Chamblee, Ga., including the audio-visual production at Chamblee. More than 200 registrants from the state departments of health and the Public Health Service were in attendance.

COLUMBIA ACCREDITED FOR MASTER'S DEGREE IN HEALTH EDUCATION

On October 23, 1949, the Executive Board, on the recommendation of the Committee on Professional Education, accredited the Columbia School of Public Health for 1949–1950 to give Master's degrees other than the M.P.H. with specialization in public health education. This accreditation is granted to Columbia in addition to the accreditation for the M.P.H. and Dr.P.H. degrees. Altogether six of the ten accredited schools of public health are now accredited for Master's degrees other than the M.P.H. with specialization in public health education. Lists of all accredited schools together with the degrees for which they are accredited and the names of the deans or directors are available from the A.P.H.A. central office.

THE NATION'S HOSPITAL NEEDS

The Nation's Needs for Hospitals and Health Centers by Dorothy P. Rice and Louis S. Reed has just been issued by

the Division of Hospital Facilities, Public Health Service. A 159 page booklet, it summarizes the plans of states and territories for hospital survey and construction activities under the Hill-Burton program (Public Law 725, 79th Congress). It is the first analysis published of the state plans for hospital construction under this program. Chapters are devoted to background information on the law and its operation, general methods of planning for construction programs by the states and summary data on state needs for hospital beds. State maps of hospital service areas and regions and tabular statistics occupy the bulk of the report. The report is available from the Public Health Service, Division of Hospital Facilities, Washington, D. C.

1949 HEALTH OFFICER'S DIRECTORY

The 1949 Directory of Full-Time Local Health Officers of the Public Health Service is out. It has few variations from those of former years except that it no longer makes a distinction between county and city-county health departments. The summary tables show a small increase in number of counties covered, a small decrease in city departments, a small increase in single county departments, and a slightly larger increase in district units. There has been relatively little change in number of health officer vacancies, the most significant being a rise in number and ratio of health officer vacancies in single county health departments. U. S. Gov. Ptg. Office, Washington 25, D. C., 15 cents.

THE JOHN SCOTT AWARD TO DR. KING

Charles Glen King, Ph.D., scientific director of the Nutrition Foundation, New York, and professor of Chemistry at Columbia University, has received the 1949 John Scott Award of the City of Philadelphia, recognizing his " outstanding work on the chemistry of vitamin C." The Award consists of $1,000 and a medal and was presented to Dr. King at a recent meeting of the Pittsburgh section of the American Chemical Society.

Dr. King, who was recently Chairman of the Food and Nutrition Section of the A.P.H.A., is well known for his contributions to the isolation, chemical identification, and synthesis of vitamin C (ascorbic acid). He has also conducted other fundamental researches in nutrition, has studied enzymes and done work on the molecular structure of sugars and fats.

PUBLIC HEALTH WORKERS DIE IN AIRPLANE DISASTER

The collision on November 1 between two planes near the Washington, D. C., airport, described as the worst disaster in civilian aviation, took the lives of three women who had been in attendance at the 77th Annual Meeting of the American Public Health Association in New York City in the preceding days.

Mrs. Thelma Foster of New York City, Territorial Supervisor with the Metropolitan Life Insurance Company Nursing Service in the southern states from Virginia to Florida, had previously been the Director of Nursing Activities in the Nashville-Davidson County Chapter of the American Red Cross, Nashville, Tenn. She joined the staff of the Metropolitan Life Insurance Company two years ago. She had been identified with the Public Health Nursing Section of the American Public Health Association since December, 1945. She is survived by her parents, Mr. and Mrs. George W. Shaw of Missoula, Mont.

Miss Beatrice Costa, Health Educator of Rio Piedras, Puerto Rico, and Miss Olga Martinez, a nutritionist with the Bureau of Maternal and Child Hygiene, Insular Department of Health, Santurce, Puerto Rico, also lost their lives. Miss Martinez, who held a Master of Science degree from Western Reserve Univer-

sity, had been a member of the Food and Nutrition Section since 1947. She held the title of Principal Nutritionist.

LORD BOYD ORR RECEIVES NOBEL AWARD FOR WORLD PEACE

The Nobel Committee of the Norwegian Parliament has announced that the Nobel Peace Prize for 1949 has been awarded to Lord Boyd Orr of Great Britain, nutrition expert and crusader for world government. The award this year amounts to 156,290 Norwegian kroner, said to be about $21,890. The presentation is to be made in Oslo in December.

Lord Boyd Orr, who is 69 years old, was the former Director General of the United Nations Food and Agricultural Organization. Created a Baron by King George VI early in 1949, Lord Boyd Orr is better known in the United States as Sir John Boyd Orr. He is an Honorary Fellow of the American Public Health Association.

UNIVERSITY MOBILE LABORATORY

The University of Washington Medical School's department of public health and preventive medicine has a mobile laboratory which can be rushed to any part of the state for epidemic control or for use in field research. It was used first in the Yakima valley for a follow-up research study of encephalitis which began August 1. The research was a joint investigation of the Medical School, the Washington State Department of Health, the Hooper Foundation and the University of California Medical School. Materials collected will be studied in detail later at the medical school. The laboratory is reportedly one of the few of its kind in the nation.

A SEWER ORDINANCE MANUAL

The 44 page manual of practice, *Municipal Sewer Ordinances*, is the third of the series of special manuals by the Federation of Sewage Works Associations. It was prepared by the Sewage Works Practice Subcommittee on Municipal Sewer Ordinances, of which Don E. Bloodgood is chairman.

Discussed are the consequences of inadequate control of the use of public sewers and various types of regulations as set forth in a large number of prevailing ordinances. Also considered are policies and recommended practices relating to the admission of industrial wastes into public sewers for treatment and disposal by the municipality. A procedure for evaluating and handling such wastes is presented, with a discussion of limiting values for objectionable characteristics. A "model" form of ordinance, with suggested permit forms, is included to illustrate application of the basic principles of good practice. Federation of Sewage Works Associations, 325 Illinois Building, Champaign, Ill., $1.00.

COURSE ON VIRUS RESEARCH

The Department of Microbiology of New York University College of Medicine will give an intensive ten week course in the theories and techniques of virus research, March to June, 1950. The course, occupying the full time of the student, will include lectures, discussion and laboratory work; the latter including the techniques currently used with bacterial and mammalian viruses such as, methods of cultivation, purification, concentration, and assay of viruses, their serological reactions, and the hemagglutination. Credit for two full courses or 24 points will be given by the Graduate School of New York University. Because the number of students is limited to 12, early application is recommended. Further information from the Department of Microbiology, 477 First Avenue, New York 16, N. Y.

AIR POLLUTION SYMPOSIUM

The American Meteorological Society's 30th anniversay meeting in St.

Louis, January 3–6, 1950, will feature an air pollution symposium. The symposium will be presented in two parts, the first a panel discussion on abatement, enforcement, public health significance, control equipment, etc.; the second, a series of technical papers on sources of air pollution and its control. Further information from the American Meteorological Society, 5 Joy Street, Boston 8, Mass.

DIVISION OF INDUSTRIAL HYGIENE MOVES

In line with the policy to concentrate environmental research activities in Cincinnati, a large segment of the Division of Industrial Hygiene, Public Health Service, has moved from Washington to the Environmental Health Center building in Cincinnati. Thus for the first time since the war, the Division will have adequate laboratory space.

DR. TOP MOVES TO MINNESOTA

Gaylord W. Anderson, M.D., Dr.P.H., Mayo Professor and Director, School of Public Health, University of Minnesota, Minneapolis, has announced on behalf of the School of Public Health the appointment of Franklin H. Top, M.D. of Detroit as Professor of Epidemiology, effective September 1950. According to the announcement, Dr. Top will also carry appointment in the Department of Pediatrics in the Medical School in connection with clinical instruction in the acute communicable diseases.

Dr. Top, who is a native of Michigan, was graduated in medicine from the University of Pennsylvania in 1928 and received his M.P.H. from Johns Hopkins in 1935. He has been connected with the Herman Kiefer Hospital and the Detroit Department of Health since 1930, and for the last eleven years has been Director of Communicable Diseases and Epidemiology in the Detroit Department of Health and the Herman Kiefer Hospital. Dr. Top has served for the last three years as Secretary of the Epidemiology Section, A.P.H.A.

DR. SECKINGER APPOINTED DISTRICT OF COLUMBIA HEALTH OFFICER

Announcement was made by the Board of Commissioners of the District of Columbia early in November of the appointment of Daniel L. Seckinger, M.D., Dr.P.H., formerly the Assistant Health Officer and Coördinator of Health and Hospitals, as Health Officer of the District of Columbia to succeed George C. Ruhland, M.D., retired, effective November 3.

Dr. Seckinger, who has served on the Washington staff since 1935, holds M.P.H. and Dr.P.H. degrees from Johns Hopkins University School of Hygiene and Public Health.

The names of five bureau directors who have recently taken over responsibility in the District of Columbia Health Department follow:

Charlotte P. Donlan, M.D., Bureau of Cancer Control

Richard L. DeSaussure, M.D., Bureau of School Medical Inspection

Walter W. Burdette, Bureau of Food Inspection

Carl C. Dauer, M.D., Bureau of Preventable Diseases

J. Edgar Caswell, Bureau of Public Health Education

PERSONALS

MAURICE L. ALLCORN, formerly Classification Analyst for the Indiana State Personnel Bureau, has been appointed director of the Division of Personnel of the State Board of Health succeeding WALTER J. WOLPERT,† who now holds the newly created position of executive assistant in the Bureau of Local Health Administration.

M. ROBERT BARNETT, blinded at the age of 15 and the youngest director ever to head a national organization for the blind, is new executive director of the American Foundation for the Blind, with headquarters in New York City.

ESTHER B. BARTLETT, R.N.,† formerly director of nurses, Wood and Sandusky Counties, Ohio, has been made superintendent, Bureau

* Fellow A.P.H.A.
† Member A.P.H.A.

of Public Health Nursing, Toledo, Ohio, Health Department.

GARRY G. BASSETT, M.D., has succeeded WALLACE J. BENNER, M.D., as Health Commissioner, Lakewood, Ohio

CHARLES H. BENNING, M.D.,* formerly chief of Public Health for Office of Military Government, U. S. Sector of Berlin, has been appointed Chief of the Public Health & Welfare Branch, Office of U. S. High Commissioner Government for Land Hesse.

MARY S. BITNER, M.D., for 3 years assistant professor of hygiene, Iowa State College, recently became Director of the Maternal and Child Health Division, Nebraska State Department of Health.

KATHLEEN BOLAND,† a graduate in public health education from the Columbia University School of Public Health, has been appointed assistant director of health education in the Erie County (New York) Health Department.

GORDON E. BROWN, has succeeded ROBERT V. TITUS as director of public relations and fund raising for the New York State Charities Aid Association.

MARY LEE BROWN, R.N., B.S., M.P.H.,* director of public health nursing and associate professor of nursing education, Meharry Medical College, has been awarded a Commonwealth Fund fellowship and is on a year's leave of absence to study the Social Aspects of the Medical Care Program in Great Britain, under the direction of the London School of Hygiene and Tropical Medicine.

MARGARET CAIN, who has been Executive Secretary of the Oswego County (New York) Tuberculosis and Health Association for the last 3 years, has resigned to accept a staff position with the Rochester-Monroe County Tuberculosis and Health Association, Rochester, N. Y.

J. BERRY CHRISTIAN, has begun her duties as a clinical nurse for the Sweetwater-Nolan County (Texas) Health Unit.

DAVID COWGILL, M.D.,* former director of the Abilene-Taylor County Health Unit in Texas, is now Health Officer of Eau Claire City and County, Wis.

ETHEL DAVIS, senior staff nurse, Cortland County (New York) Health Department has resigned to become elementary school nurse in the City of Cortland.

RICHARD E. ELVINS, M.D.,† formerly director of the San Angelo-Tom Green County Health Unit, Texas, is now chief physician at the Texas Medical Center, a unit of the Medical Department of the Phillips Petroleum Company, Phillips, Tex.

PAUL S. FANCHER, COL., MC., USA, assumed duty in August as Chief of Medical Service, Walter Reed General Hospital. He succeeds COLONEL CHARLES R. MUELLER, who has been transferred to Murphy General Hospital, Waltham, Mass.

SAUL FRANCES, M.D.,† formerly a member of the Department of Bacteriology, College of Physicians and Surgeons, Columbia University, has become Director of Wells Laboratories, Inc., Jersey City, N. J., to provide consultant service plus research and testing facilities to commerce and industry.

JOE W. GREEVER, D.D.S., formerly in private practice, has joined the Division of Preventive Dentistry, Oklahoma State Department of Health, to do clinical work in local health departments throughout the state.

WILLIAM MASON HALE, M.D.,† has been named head of the bacteriology and virology division, and SIDNEY C. MADDEN, M.D., of the pathology division of the Department of Medicine at Brookhaven National Laboratory (New York), northeastern center for nuclear research. Dr. Hale formerly was professor and head of the Department of Bacteriology of the College of Medicine, Iowa State University, and Dr. Madden was professor and chairman of Department of Pathology, Emory University School of Medicine, Atlanta, Ga.

NANCY L. HANEY, for the past 2½ years associate editor of the Publications Department of the Y.W.C.A., National Board, has been appointed assistant to the public relations director of the Committee on Careers in Nursing.

RALPH E. HEAL, PH.D., formerly with Merck & Co., Rahway, N. J., has been appointed Technical Director of the National Pest Control Association, Brooklyn, N. Y.

MARTIN D. HICKLIN, M.D., M.P.H.,† is the new medical director, Iowa State Health Department District Health Service No. 9, with headquarters in Burlington, and director of the Des Moines County Health Department.

MARY WILLIAMSON HOOKER, formerly director of fashion publicity for Cecil & Presbrey, New York City, has been named director of public relations for the New York Tuberculosis and Health Association.

GUSTAVA JONES, R.N., formerly with the Omaha Visiting Nurse Association, has accepted a position in the Tuberculosis Control Division, Nebraska State Health Department.

MARY KARPIAK,† formerly health educator of the Onondaga (New York) Health Association, has been appointed to a similar position in the Rochester City Health Department.

JEANNE HESS KEENER, has succeeded JESSIE S. GLASS as supervisor of health education and program development, Tuberculosis Society of Lancaster County, Pa.

ANDREW W. KOVACS, for the past 4 years research editor, Michigan Tuberculosis Association, is now director of health education, Tuberculosis League of Pittsburgh.

CARL L. LARSON, M.D., formerly assistant chief of the Laboratory of Infectious Diseases, Microbiological Institute, National Institutes of Health, is now Director of the Rocky Mountain Laboratory of the Public Health Service, succeeding RALPH R. PARKER, M.D., deceased.

CHARLES H. MANN, M.D., DR.P.H.,* formerly associate director, Department of Public Health, E. R. Squibb & Sons, is now medical director of the Heyden Chemical Corporation, New York, Professional Products Division.

H. BERTON MCCAULEY, D.D.S., became on August 1 the first full-time director of the Bureau of Dental Care in the Baltimore City Health Department.

FLORENCE L. MCKAY, M.D.,† director of the Division of Maternal and Child Health, Massachusetts State Department of Health since 1936, retired on October 31.

FRED P. MEYERS, PH.D., who has been doing polio immunization research for the National Foundation for Infantile Paralysis, joined the staff of the Colorado State Health Department as Assistant Director of the Laboratory Section.

CLARICE L. H. PENNOCK, who served as Secretary of the National Conference on Family Life, will direct a new program of field work in the four social science departments of Vassar College (Poughkeepsie, N. Y.) under a five year grant from the Carnegie Corporation.

DAVID L. PIPER, PH.D.,† director of health education, Oregon State Health Department, has resigned to become health education consultant, Institute of Inter-American Affairs of the U. S. State Department, where his first assignment will be in Lima, Peru.

BENEDICT RAMIN, M.D.,† child welfare physician in the Division of Tuberculosis, Massachusetts State Department of Health since 1931, is now tuberculosis consultant in the Boston branch office of the Veterans Administration.

VERNE ROBINSON, has been appointed Director of the Division of Public Health Statistics, Indiana State Department of Health, succeeding ROBERT E. SERFLING, PH.D.† who resigned to join the U. S. Public Health Service.

JONAS E. SALK, M.D.* has been promoted to the position of research professor of bacteriology in the School of Medicine, University of Pittsburgh. He is directing the work of the school's virus research laboratory concerned with problems in influenza and poliomyelitis.

DOROTHY E. SCHOBER, M.P.H.,† who for the past 3 years has been health education consultant, New Haven Health Department, became heart work consultant for the New York State Committee on Tuberculosis and Public Health, New York, on November 1.

WILLIAM H. SEBRELL, M.D.,* director of the Experimental Biology and Medicine Institute of the National Institutes of Health, has been appointed a member of the Joint Expert Committee on Nutrition of the Food and Agriculture Organization and the World Health Organization.

CLAUDE A. SELBY, M.D.,* formerly director of the Cameron County Health Unit in Texas, has been appointed director of the new San Patricio County Health Department, with headquarters in Sinton.

JAMES SPROUSE, a recent law graduate of Columbia University, New York, has been employed by the West Virginia State Department of Health to make a thorough search of the Minutes of the Public Health Council and the Code of West Virginia, so that an up-to-the-minute edition of all public health laws and regulations now in force may be obtained.

JOHN S. STANLEY, M.D.,† superintendent of preventive medicine, Indianapolis City Board of Health for the last 3 years, has gone to Tokyo where he will act as public health officer under GEN. DOUGLAS MACARTHUR.

WILLIAM H. TURVILLE, M.D., recently retired from the U. S. Naval Medical Corps after 32 years' service, has been named an epidemiologist in the Division of Tuberculosis, Massachusetts State Department of Health.

HARRY E. UNGERLEIDER, M.D.,* Medical Director of the Equitable Life Assurance Society of the United States, New York, was recently elected President of the Association of Life Insurance Medical Directors at the New York meeting.

FLORENCE WALT, social hygiene educator, Nebraska State Health Department since 1943, has resigned to become Dean of Women and Health Education Instructor at Doane College, Crete, Neb.

LOUIS F. WARRICK,* formerly director, Bureau of Sanitary Engineering, Wisconsin State Department of Health, has been appointed Chief of the Technical Services Branch of the Water Pollution Control Division, Pub-

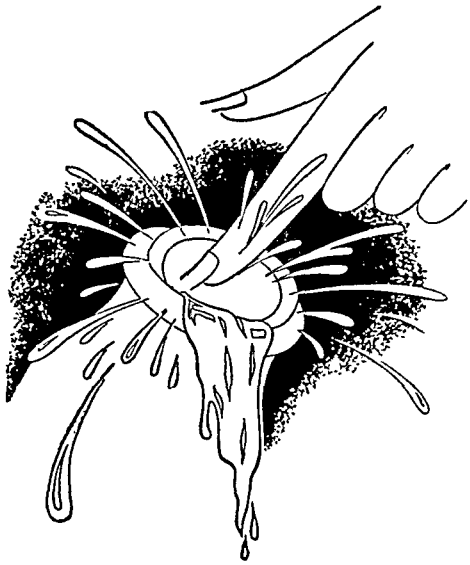
AN INTRODUCTION TO MEDICAL STATISTICS



By HILDA M. WOODS *and* WILLIAM T. RUSSELL

This valuable book explains in non-technical language, and with the help of practical examples, the most important methods of measuring and analyzing the growth of population and mortality. For Medical Health Officers or anyone who works with statistics here is an excellent introduction. Or if not professionally concerned, here's how to understand any official report on population and mortality . . . and see how interesting the vital information of medical documents can be. Included subjects concern: Vital Statistics, Tabulation Data, Construction of Charts and Graphs, Population Estimates, Standardized Death Rates, Averages, Measures of Dispersion, Correlation, Coefficient of Regression, Life Tables, Sampling. Yours for only $1.75. Order Now! (Money back guarantee). Staples Press, Inc., Dept. H-1, 70 East 45 Street, New York 17, N. Y.

PROTECTS CONSUMERS AGAINST *THEMSELVES!*

Milk contamination can too often occur in the hands of the ultimate consumer. Fork-prying and finger-pushing methods of opening bottles and careless discarding of a separate hood—common in both home and restaurant—constitute real threats to milk purity.

Genuine snug-fitting Seal-Kaps minimize these dangers. Seal-Kaps come off with a simple twisting motion. No need to pry or push. And they *snap back on* as often as necessary to protect securely the pouring lip until the last drop is used. There is no separate hood to discard, because Seal-Kap is disc and hood *in one.* And since it's so convenient to use, consumers automatically enjoy a superior protection—protection *against themselves!*

Announcing the publication of

DIAGNOSTIC PROCEDURES IN VIRUS AND RICKETTSIAL DISEASES

This handbook, prepared by the Committee on Virus and Rickettsial Diseases of the Laboratory Section and edited by the Chairman of the Committee, Thomas F. Francis, Jr., M.D., details procedures which can be employed and interpreted by laboratory workers in the diagnosis of sixteen virus diseases. The diseases selected are essentially those of man for which procedures are available for use in a diagnostic laboratory.

Each of the sixteen sections has been written by an authority in the field. Much of the experience of each author has been contributed to his chapter and as a result the entire volume constitutes a compilation of methods proved by actual experience.

The volume has grown out of a recognized need for a publication of collected methods and has developed from a round table presentation at the Annual Meeting of the American Public Health Association in 1946. The methods are not presented as standards but are those most currently useful.

Members of the committee who have contributed and their subjects are as follows:

Psittacosis
K. F. Meyer, Ph.D., M.D. and B. Eddie, Dr.P.H.

Lymphogranuloma Venereum
Geoffrey Rake, M.B.

Trachoma and Inclusion Blennorrhea
Phillips Thygeson, M.D.

Variola and Vaccinia

How to Use the INDEX

This is an Index to all the reading matter in the JOURNAL. It is essentially a title and author Index, although occasional subject headings are provided.

Articles, committee reports, and editorials are listed alphabetically according to the key words in the title, with many cross-references.

Editorials are indexed under "Editorials" as well as alphabetically under the key words in the title.

News notes and fillers are indexed under "News from the Field." This section should be searched as supplemental to the title index.

Matters pertaining to the Association are indexed under "American Public Health Association," and "Year Book."

Book reviews are indexed under "Books and Reports."

Obituaries are indexed under "Death Notices."
